In some of the former schemes the area allotted for each officer has been 150 square feet. This area was arrived at after careful investigation by Government and other public officers, and much consideration by former committees of the Council. It makes allowance for the extra room which is necessarily required for chief and assistant chief officers who have to receive a number of persons simultaneously, and it is thought that this basis should still be adopted, at any rate, for settling the requirements of the site until more detail plans can be matured.

In estimating the accommodation required it is true that we have not allowed for what we conceive to be the extravagant spacing by reason of the separate buildings of the present staff, but taking into consideration the very inadequate space allowed to each officer, and having regard also to the fact that the Council should maintain a high efficiency of health conditions, we do not think that our estimates are too high.

In the course of our deliberations, we have carefully weighed the advantages and disadvantages of several sites, the majority being considered unsuitable, either on the ground of excessive cost, or on account of the sites being inconveniently situated. The number of sites was eventually reduced to two, namely, a site in the Adelphi and the Westminster Bridge site, and after anxious consideration we have unanimously decided to ask the Council to take the necessary steps to acquire the latter mentioned site, which has an area of 5.6 acres, or 248,776 square feet, being bounded on the west by the river Thames, on the south by the approach to Westminster Bridge, on the east by Belvedere Road, and on the north by the premises occupied by the Council's works department. The proposed site plus the land occupied by the works department has an area of about 7.5 acres.

The site is conveniently near the Houses of Parliament and the Government offices, and, although on the south side of the river, is in a central position with regard to means of communication from all parts of London. The site is near Waterloo railway station, and consequently can be reached from the City in a few minutes, and a tube railway is in course of construction which will link Waterloo with Charing Cross, Piccadilly Circus, Oxford Circus, the Baker Street termini and Paddington station. Westminster Bridge station on the District and Metropolitan Railways is within a few minutes' walk, and in the present session the promoters of the Great Northern, Piccadilly and Brompton Railway seek to extend their line from the Strand to Waterloo, which will connect the latter station with King's Cross and Finsbury Park stations. In fact there is in existence, or will be within the next few years, means of communication between the neighbourhood of the suggested site and the termini in London of all the great railways. The district is served by numerous routes of omnibuses, one of the principal termini of the Council's tramways is adjacent to the site, and additional facilities for communication will be available if the proposed tramways over Westminster Bridge and along the Victoria Embankment are sanctioned. Mention should also be made of the means of communication to be afforded by the Council's steamboat service.

We also think the site offers exceptional opportunities for architectural treatment. The river at this point runs nearly due north, and the site being approximately parallel with the river, three façades would be respectively on the south, east and west aspects, and the maximum of sunlight would thus obtain throughout. In the middle portion of the river façade might be placed the council chamber and committee-rooms which could be grouped as a central feature, and in this position would be subject to a minimum of the external disturbing influences of traffic and noise. The river frontage is approximately 800 feet, and for the purpose of comparison we may mention the frontage of Somerset House is about 550 feet.

The scheme of development contemplates forming an embankment next the river, similar to that in front of St. Thomas's Hospital, which includes a terrace apart from the public embankment, and which would add architectural dignity to the river frontage. To improve vehicular approach, and also the lighting of the lower floors on the east frontage, the width of Belvedere Road will be increased to 50 feet. The leading dimensions will be river frontage 800 feet, the bridge approach 240 feet and Belvedere Road 760 feet. It will be seen that approaches will obtain on three sides of the proposed building, and an important improvement initiated on that side of the river.

On the basis of 150 superficial feet for each officer, the building will accommodate 2,589 officers, and 61,790 square feet for storage accommodation, &c., will be provided.

The estimated cost of acquiring the site of 5.6 acres is	£600,000
The estimated cost of the building, foundations, &c., is	1,056,000
The estimated cost of the embankment is	44,000
	£1,700,000

In considering these figures we would remind the Council that the rent for central offices at which the Council stands, taking into account the estimated rent of certain premises held at ground rents, is 42,165% a year, and the capital value of the Council's interest in the premises used as central offices, including the education offices, estimated at 400,000.

It should also be borne in mind that it is estimated the new site will accommodate 50 per cent. more officers than the present offices, and that the cost of housing the increased number under present conditions, and taking the amount now paid, &c., for rent as a basis, would probably be over 60,000% a year.

The report was presented on Tuesday but was not discussed. Plans of the site were exhibited and a sketch of such a façade to the Thames as would be feasible. The establishment committee say it is intended to treat the exterior of the building in a simple and dignified manner to exclude all useless ornament, and to depend more upon the proportion of the masses to attain dignity and fitness and the appearance of the building.

CULROSS ABBEY.

THE heritors of the parish of Culross have decided to proceed with the repairs and restoration of the ancient abbey. While the works are in progress the congregation will meet in the Abbey House, part of which has been set aside for the purpose by Lord Bruce. The complete restoration of the church, plans for which have been prepared by Sir Rowand Anderson, embodies clearing out the east and south galleries, as well as all the existing seating and woodwork in the area of the church, the seating accommodation lost through the abolishing of the galleries being provided by restoring the north chancel aisle and the aisle on the east side of south transept. Other works to be executed comprise entirely re-roofing and laying wood-block floor on original level in existing building, reducing the ground level at entrance to its original surface, rearrangement of gallery stair, opening up the original windows of the church where possible and reglazing all windows, reseating the entire church to accommodate about 500 persons, along with necessary works to put the building into a complete state of repair. The scheme also includes the erection of a new and more convenient vestry and the repair of the manse. The cost of the scheme is estimated to amount to 4,400. At present, however, the heritors intend to go on with a slightly modified scheme at an estimated cost of 3,760, the intention being that if the sum raised by subscription which meanwhile amounts to 1,200, increases during the progress of the work the whole scheme will be undertaken the architect having arranged the plans with that view. The sum necessary for the work the heritors have agreed to contribute 2,500. In view of the decision arrived at by the heritors, Mr. Jas. Arnot, clerk to the Edinburgh School Board, has offered to fill in the east window with stained glass, Miss Luke, Culross, offering to defray the cost of similar treatment of the north window.

EDINBURGH ARCHITECTURAL ASSOCIATION

AT the last meeting of the Edinburgh Architectural Association, Mr. J. T. Baillie, vice-president, in the chair, the subject of the statutory qualification of architects was discussed. The chairman said the movement had been set on foot many years ago.

Mr. A. W. S. Cross said the present position of their profession was eminently unsatisfactory, for while the work of modern architects often displayed a large amount of creative power or originality that attribute was rarely accompanied by architectural scholarship. In this respect they had much to learn from the architecture of ancient Greece and Rome. He pleaded for a higher standard of culture among architects. He dealt with the Royal Institute of British Architects and said that in its prestige and influence it was amazing that it had taken so small a part in any proposals for registration.

The leading principles of the scheme of reform should include a Bill in Parliament tending to increase the prestige of the Institute, and to constitute it the examining and registration authority. The scheme would afford reasonable facilities to enable every competent architect and student to obtain registration, and would close the door of the profession to incompetent practitioners. The Institute might introduce means for the practical training of architects, and endeavour to induce universities to create chairs of architecture, so that the profession would be raised to a status which would insure that architects of the future would be trained and cultured men.

Mr. G. J. T. Middleton said their aim was to put the architectural profession on the same level as the medical profession, so that no man should practise as an architect unless properly trained and properly qualified by adequate examination. He explained the provisions of the Bill for the registration of architects promoted by the Society of Architects, stated that it was a better Bill than that promoted by the Council of the Institute, and urged agreement between parties so that a registration Bill would be put before Parliament by a united profession.

Mr. Henry F. Kerr said he doubted the practicableness of the proposed compulsory registration by Act of Parliament, and that progress in raising the standard of the profession would be better made by encouraging the taking of the diploma of the Institute.

Messrs. Robertson, Ross and M'Arthy commended the proposal for compulsory registration on the ground that the profession suffered grievously from the competition of untrained and unskilled men such as masons and joiners, who put up their door-plates and called themselves architects. Although no resolution was put, this was the feeling of the meeting.

JOHN O' GAUNT'S CASTLE.

At Newcastle-under-Lyme some Corporation workmen, as says the *Manchester Guardian*, are placidly reburying the foundations of the castle which was John o' Gaunt's home in Staffordshire. The same workmen first found the ancient masonry a few months ago, when they were laying a new sewer along a new street in the hollow that lies below the old church tower. For a short space of time the Newcastle people were genuinely enthusiastic about the preservation of a genuine archaeological treasure. There was talk of excavating the whole site of the castle, laying the masonry and putting up a monument to "time-honoured Lancaster." Old John o' Gaunt left to Newcastle such a legacy by which centuries of Novocastrians have benefited directly. Every native of the town who serves an apprenticeship and continues to live there is entitled to share in the annual distribution of the moneys of the Gaunt Trust, and to-day there are 600 people who march triumphantly once a year to the offices of the solicitor of the Trust and claim a handful of silver—about 28s. apiece. It is for a substantial reason, then, that the Newcastle people talk about Gaunt's "beneficence" and speak with pride of the "royal" associations of their town. But the lip service the benefactor has been put lately to a severe test, and its weakness has been revealed. When the Corporation workmen unexpectedly struck the foundations of the old castle there arose the question of whether the excavations should be continued, and how the cost should be defrayed. By chance most of the land within the area of the castle site was Corporation property. There was, therefore, no serious initial difficulty of ownership to be overcome, and it was a simple matter to estimate the probable cost of the excavations. Some experimental digging was done, and some 40 feet of old masonry in splendid preservation was bared. The stonework was only a foot or two beneath the surface, and its condition was as sound and firm as if it had been laid by masons of the nineteenth instead of a far earlier century. Then came the question of continuing the excavations. A sum of 400l. was named as the probable outside cost, and a proposal was put before the Gaunt Trustees that the members should contribute something towards the proposed outlay from their yearly dole. At this suggestion was made the enthusiasm for uncovering the remains of the castle began to wane. The Gaunt Trustees buttoned the Trust pockets determinedly. Archaeologists came and went and failed to set an example either in enterprise or generosity. The Corporation had finally to decide what was to be done, and the workmen are now carrying their decision into effect. If the Corporation had determined to uncover and preserve what may remain

of the castle they would have had to divert their new street, and perhaps to have made a small purchase of contiguous property. But the members came to the unenterprising conclusion that "it wasn't worth it," and so the sewer has been laid and the displaced earth shovelled back into the trenches.

THE ROYAL COLLEGE OF SCIENCE, DUBLIN.

IN an interview with a representative of the *Irish Times* Mr. Thomas Manly Deane, who is joint architect with Sir Aston Webb of the Royal College of Science, Dublin, gave some details as to the preliminary plans of the new scheme, which, it may be added, will cost probably not less than 150,000l. The entire buildings will be erected in the form of a hollow square opening out on Upper Merrion Street, the frontage being about 390 feet and the depth about 170 feet. The College will form the principal side of the square, and from it on each side will project wings in which the officers of the Agricultural Department and the Board of Works will be eventually accommodated. These wings will have a frontage in Upper Merrion Street of nearly 90 feet, and will run the entire depth of the site, while the College will have a frontage of some 200 feet and a depth of about 73 feet. Between the wings and in front of the College there will be a courtyard of nearly 200 feet wide. Merrion Place will be widened to about 40 feet, and entrance to the College will be gained temporarily through this improved thoroughfare. In the meantime the houses in Upper Merrion Street will remain as they are at present, but as the scheme is worked out and the wings are completed the public boards occupying them will be transferred to the new premises. The College buildings on the inner side of the square are the only portion on which operations will be conducted just now. When the wings are completed and the houses in Upper Merrion Street have been demolished the present railings in front of the lawn will be continued as far as Merrion Place, and will enclose an ornamental grass plot in front of the public offices and the courtyard of the College, and also contain a handsome entrance leading into the main block. From this it will be seen what a vast improvement will be effected by the scheme.

The ground plans of the College are practically complete, and the general arrangements have also been settled, but the elevations, &c., are still in the architects' hands, so that the shape which the buildings will ultimately assume is not in a sufficiently advanced stage to admit of any detailed description. The sketch plans of the College disclose a most imposing structure, with beautifully modelled turrets surmounting the entrance. However, these plans may be subject to considerable alteration, but at any rate they indicate that the architectural beauty of the work is being steadily kept in view. A contract has been entered into for the clearing and excavation of the site of the College, and these preliminary stages of the work are being carried out by Messrs. H. & J. Martin, of Dublin and Belfast.

THE ASSOUAN DAM.

THE last doubts as to the stability of the Assouan dam have brought a communication from Sir William Willcocks on the subject. Writing in the *Egyptian Gazette*, he describes the problems that confronted the engineers, and sums up the position thus:—We may say that at the Assouan dam we have against us (1) The known calculable force of the water trying to overturn the dam; and (2) certain other greatly minimised but possible forces trying to lift it off its base. We have for us:—(1) The whole weight of the dam, which with wide factors of safety is capable of resisting all the known forces by its weight alone; (2) we have a structure built of the most tenacious cement mortar, while in our calculations we have assumed that it is built of mud; (3) we have a rock whose veins are notoriously vertical and therefore safe, and moreover these veins are bounded on either side by solid granite, to which the dam is tied by neat cement mortar thrown in by thousands of barrels, while in our calculations we have assumed that we might have thrown in so much plum jam; and (4) we have a foundation taken down into granite rock regardless of expense and supervised in every detail by sound engineers.

Municipal Buildings are to be erected in Hamilton, N.B., from the designs of Mr. Alexander Cullen.

NOTES AND COMMENTS.

THE instructions to architects who will take part in the competition for the reconstruction of the town hall of Perth have been approved by the committee. The amount to be expended, including all external and internal embellishments, lighting, heating and ventilation, and all requisite fixtures and cost of movable furnishings, and taking down and re-erecting organ, is not to exceed 15,000*l*. The new city hall which will have to be provided must afford accommodation for at least 2,500 people. Exits can be shown on the plans from the hall to streets which will be formed on the north and south sides of it, but the exits on the north side must be opposite the ground belonging to the Town Council next King Edward Street. There is also a scheme for reconstruction of the existing buildings. The competitors can adopt any style they consider suitable.

RAILWAY companies were generally supposed to favour contracts for lump sums, and quantities used to be treated in a wholesale manner. It is therefore somewhat difficult to determine what is the basis of a contract, and a doubt of this kind has given rise to an action of which we may hear subsequently in the High Courts. It arose out of the reconstruction of a bridge on the North-Eastern Railway. The Company entered into a contract with the trustees of JOHN BUTLER & Co., engineers and ironfounders, for the whole work. The trustees sublet the masonry and brickwork to Messrs. ATKINSON & SON, builders, of Stockton, the amount being 583*l*. Before settling the account the work was measured, and then it was discovered that, instead of there being 150 cubic yards as in the quantities, there were only 100 yards. The sum of 84*l*. was accordingly deducted from Messrs. BUTLER's account. The same amount was then deducted from Messrs. ATKINSON's account on the ground that they were bound by the conditions of the contract entered into by Messrs. BUTLER. Messrs. ATKINSON insisted that their contract was for a lump sum, and they sued the contractors in the Stockton County Court for 84*l*. 19*s*. 1*d*. as balance due for work executed. The Judge adopted the sub-contractors' view, and judgment was given for the amount claimed with costs. A stay of execution was granted in view of the appeal. Apparently the dispute might have been avoided if a proper agreement had been drawn up.

THE registration of land in England was for a long time advocated by political economists and statesmen before an Act for the purpose was passed. Registration is not made compulsory, and practically the Act may be said to apply in consequence to a very limited area. The mischief which the Act was intended to remove closely concerns building. Many timid people are afraid to purchase building sites or to erect houses or business premises on them through a misgiving that the title will one day be discovered to have some flaw in it, and that a great loss will follow. From what was said at a conference of representatives of town and county councils which was held in Glasgow, it would appear that registration is more necessary in Scotland than in England. The obscurity of the title requires a long investigation, and, of course, a large expenditure on law costs. One case was mentioned where the transferring of property valued at 142*l*. involved legal expenses of 233*l*. In another where the value was 122*l*. the lawyers were paid 377*l*. A case where the costs were 138*l*. for a property worth 137*l*. must be considered as a cheap transaction. The Corporation of Glasgow had to pay 730*l*. as legal expenses on one purchase. A Blue-book appeared not long ago in which it was shown that on the Continent the transferring of land from one owner to another was a simple operation. In the past the system was accepted as a matter of course. Times have changed; the Cor-

poration of Glasgow have found that the certificate of registrar can serve as well as a vast mass of documents and it has therefore been decided that representative from the city and various burghs shall take such steps as may be deemed expedient for furthering the introduction of registration into Scotland.

IF the opinion of foreign critics could be taken, would be found that Paris is more indebted to Baron HAUSSMANN than to a crowd of other administrators. His transformation of narrow and crooked streets into wide and straight thoroughfares is usually proposed as a model for imitation by other cities. It is remarkable, however, that in Paris the obligations to his enterprise are rarely acknowledged. Although there are such a vast number of statues in the streets, there is not one of HAUSSMANN. An attempt was made last Friday in the Municipal Council to obtain approval for a project of providing a memorial of that kind, but it was rejected by a large majority. What makes the aversion to the late Baron appear more extraordinary is that his principal lieutenant, M. ALPHAND, was, during several years, the director of municipal works, and that a memorial was erected to him after his death.

IT is generally assumed that the provincial museums of France are in a state of efficiency which it would be well for us to imitate in this country. But, according to one of the French députés, M. FERDAND ENGERAND, they are in general mismanaged to an incredible extent. Some of them, he declares, have no catalogues to the collections, and although there may be masterpieces on the walls there are no means to discover their value. Quantities of paintings are to be found in garrets, and many of the musées from the neglect of ventilation are injurious to the collections. M. ENGERAND does not wish the Government to be satisfied with his allegations. He accordingly proposes that a commission should be appointed to investigate and report on the subject, and to explain whether it is possible to derive more advantages from the works of art which are at present neglected.

THE Association for the Photographic Survey of Surrey are able to show a satisfactory result for the past year—660 photographs were received, and, as there were 612 for the preceding year, the total is 1,272. The architectural prints number 455, of which 367 represent church and church monuments. Excluding the Metropolitan area and the more populous districts of Surrey, the portion of the county to the east of Reigate may be said to have been thoroughly surveyed as regards its churches. It is remarkable, considering the number of workers in the town, that Croydon is far from complete. The parish church, St. Mary Magdalene's, Shirley Church and Christ Church, Addiscombe, are practically completed, but the remaining churches are poorly represented. There is a fairly full series of the Town Hall, Whitgift's Hospital and the Old Palace; a recent visit to the latter, however, by the Croydon Antiquities Protection Committee has brought to light some further points worth recording. There are other public buildings in Croydon which should be photographed during the present year, and several houses which, from their interest and liability to disappear, should be recorded.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting of the present session of this Association was held on Friday evening last at 11000 Street, Westminster, Mr. E. Guy Dawber, president, in the chair.

Election of Officers.

The scrutineers in their report said 479 voting papers were received, but 23 had been rejected as invalid. The following were elected:—President, Mr. E. Guy Dawber; vice-presidents, Mr. John Murray (317 votes) and Mr. Louis Ambler (303 votes). Committee (the figures signify the number of votes), Messrs. R. S. Balfour (361), A. Needham Wilson (358), H. T. Hare (356), Arnold Mitchell (311), J. S. Gibson (296), W. A. Pite (282), J. MacLaren Ross (277), A. Rickards (266), J. B. Fulton (264), M. E. Webb (212).

On the motion of the President Mr. Reginald Blomfield, R.A., was elected by acclamation a member of the Association; Messrs. C. B. Bone, F. A. Whitwell and P. A. Ash were reinstated members.

Mr. H. PHILLIPS FLETCHER read the following paper

The Buildings of the World's Fair at St. Louis, 1904.

The "World's Fair" held at St. Louis last year commemorated the centenary of the purchase of the Louisiana Territory by the United States Government from France. This territory contained over 1,000,000 square miles, and forms the central portion of the present United States. The Mississippi river formed the eastern boundary between the Louisiana Territory and the United States, and was the great highway upon which the extensive lumber trade of the Americans was carried to the port of New Orleans. In 1800 this port had been secretly retroceded from Spain to France, and two years later, when the fact was announced, great alarm was caused in the States on account of the strained relations with France. Moreover, Spanish officials still lingered at the port and were a great cause of annoyance to the Americans.

In 1803 Jefferson, the then President of the United States, sent commissioners to Napoleon the Great to see if terms could be arranged for the purchase of the city and island of New Orleans. Napoleon, apparently being in great need of money to carry out his expansive ideas in Europe, conceived the idea of bartering the whole of the Louisiana Territory for much-needed gold. The business capabilities of the little Corsican proved quite equal to dealing with the astute Yankee, and after various negotiations he succeeded in squeezing fifteen million dollars out of the pockets of the American citizens. This, the greatest deal in real estate ever negotiated, more than doubled the area of the original States, which, as defined by the Peace Treaty of 1783, contained less than one-third of the present area of this great Republic. At the time of the purchase there were many who opposed it, but the wisdom of the venture has been more than justified since by reason of its great mineral wealth and agricultural resources.

Site.

The site chosen for the Exhibition included a considerable portion of what is known as the Forest Park; and some idea of its character can be gleaned from the view on the green, which represents the same partially cleared in readiness for the preliminary engineering works. After the plans had been considerably advanced it was found that more land was necessary, and the Exhibition authorities obtained a lease of the Washington University (then in the course of erection), together with the grounds, containing 10 acres of ground belonging thereto. A piece of land known as the "Catlin Tract" was added at a later date, for the owners, knowing that it was indispensable, set a stiff price upon its sale, which the Exhibition authorities had to submit to. During the Exhibition this portion was known as the "Pike," and the amusements concessions were situated thereon. The total area of the grounds was over 240 acres, being greater than the combined areas of the Chicago, the Buffalo and the last Paris Exhibition. About one-fifth of the whole area was roofed in.

General Plan.

The main scheme of the plan somewhat resembled an open fan, and was originated by a committee of some seven or eight architects who were partners in nine prominent American firms. The plan proved to be scarcely comprehensive enough, as the Exhibition assumed much greater proportions than were anticipated. It will be seen that the instructions to the Commission were inadequate. The

consequence was that the Exhibition was to some extent marred by the fact that there were really several separate schemes for the buildings. It would perhaps have been better if some scheme had been devised which would have admitted of expansion. This would have prevented some irritation to visitors, as it involved the separation of more or less allied subjects which wasted one's physical energy in searching out the same.

The central feature of the picture was the Festival Hall, which was situated on the crest of a hill. Restaurant pavilions on either side were architecturally connected to the Festival Hall by the Colonnade of States. At the foot of the hill was the grand basin, into which three series of cascades discharged 90,000 gallons of water per minute.

Three main avenues radiated from the hill and afforded vistas terminating with the highly decorative features of the Festival Hall, the Colonnade of States and restaurant pavilions. These avenues were crossed by a grand transverse avenue, which thus gave the general outline to eight of the main Exhibit Buildings. This transverse avenue was to have had a semicircular sweep, but the extra cost it would have entailed in erecting all the buildings with curved façades was prohibitive. As planned, four of the buildings had a break in one or two of their façades which were cleverly disguised in three of them, viz. in the Education, Manufactures and the Varied Industries Pavilions.

On either side of the Grand Basin was a series of lagoons two miles in length, which surrounded two of the great Exhibit Buildings and were spanned at intervals by tastefully-designed bridges. Well executed statuary was placed in the main avenues. The other main Exhibit Buildings, the Administration Buildings and the Foreign Concessions were situated westwards of these, while the States Buildings occupied the south-eastern corner of the grounds.

An intramural electric railway, thirteen miles in length with seventeen stations, skirted the grounds and served a considerable number of the exhibits, though it missed some of the more important buildings.

After the general plan of the "Fair" had been decided upon, the civil engineer commenced his topographical survey of the ground. It was first marked out in 1,000-foot squares, and was later subdivided into 50-foot squares, readings being taken at the intersections and at such additional points as governed the contour. Maps were prepared to a scale of 50 feet to the inch, and monthly progress maps showed at a glance the advancement made in the erection of the works.

Engineering.

The engineering works and building construction involved by this Exhibition were extensive. In preparing the site for the buildings some 2,000,000 cubic yards of earth were moved. To facilitate the construction and the housing of the exhibits, 15 miles of temporary track had to be laid through the grounds, in addition to extensive storage-tracks in the south-western part of the grounds. Burnt ballast, gravel, macadam, asphalt and brick were the materials used in the road-making. Oak was used in the kerbing throughout, 10 inches by 3 inches in thickness being the scantlings employed.

An adequate water-supply was provided from the mains of the city of St. Louis. Quite a network of pipes, varying from 2 inches to 12 inches in diameter and 21 miles in length, was laid down over the entire grounds and inside of the buildings. In addition to this there were about 36 miles of pipes installed for high-pressure fire protection, and each State, foreign and concession building had to connect its own system of pipe to the Exposition mains. There were 530 high-pressure hydrants and thirty-one deck turrets for the protection of the main Exhibit Buildings. There were also five fully equipped fire-engine stations and a double company of Hale's Fire Fighters from Kansas City. The pipes for the high-pressure system for roofs and the inside and outside of buildings were of wrought-iron, tested to withstand a pressure of 750 lbs. per square inch, and a pressure of 150 lbs. was maintained by means of fourteen 1,000-gallon fire-pumps. Other means of fire protection were provided in sprinkler systems and numerous chemical fire-extinguishers placed at convenient points in each building.

The river Des Peres pursued a somewhat tortuous course through that part of the grounds upon which the main Exhibit Buildings were to be erected, and it therefore had to be diverted and the old river bed filled in. A timber flume, 45 feet wide by 15 feet deep, was constructed for this.

purpose. For the drainage of the grounds, in addition to the waterway of the harnessed Des Peres, 25 miles of storm-water drains were constructed, and ample provision was made for the reception of the water outside the grounds, so as to prevent damage from the overflow.

For the main sewerage scheme the Exhibition authorities laid down 12 miles of 8-inch vitrified pipe sewers and about $1\frac{1}{4}$ mile of brick sewers. These discharged by gravity into two wells near the Mines Building, from which the sewerage was pumped into the sewer mains of the city by four electrically-driven centrifugal pumps. In addition to this main sewerage scheme, there was the system installed for the Washington University Buildings in the north-western corner of the grounds, a few stray sewers laid by speculative builders of real estate plots, and the pipes laid by the various States and the foreign Governments and concessions.

The bridges were constructed on a standard plan. This consisted of a simple arch system of 3-inch by 14-inch timbers for the top and bottom chords, and a solid web of two courses of 2-inch by 12-inch planking. At the centre, where the head room for passing boats, &c., did not allow of the use of this truss, 3-inch by 16-inch joists were substituted and were skilfully connected to the main trusses.

The boiler-house was of fireproof construction, and was situated close to the Machinery Building. The steam mains from the boilers were conveyed through a tunnel to the Machinery Building. A garbage crematory was erected in the western portion of the grounds.

Construction.

The Division of Works had entire control over the construction of the main Exhibit Buildings. A new departure was made in constructing these of timber in lieu of steel, by reason of which a great saving in cost was effected. Ample opportunities were afforded to the architect of studying this, the greatest example of the art of carpentry ever executed, since most of the construction was visible internally owing to lack of funds to complete the plastering. The director of works stated that only forty draughtsmen were employed to prepare the drawings for the Exhibition Buildings. The designing and erection of the same occupied only some two and a half years.

The foundations of these buildings varied according to the nature of the ground, spread footings, timber cribbing or piles being used. Some idea of the timber framing, such as was employed in one of these huge structures, is shown in the view now on the screen, which is the skeleton of one of the restaurant pavilions.

Long leaf yellow pine was used for all posts, roof trusses and framing. The safe tensile strain was taken at 1,800 lbs. per square inch, the safe compression perpendicular to the grain 800 lbs. per square inch, the safe shearing stress parallel to the grain 150 lbs. per square inch. In the white oak keys the safe stress parallel to the grain was taken at 400 lbs. per square inch.

The walls of the main Exhibit Buildings, which were 2 feet in thickness, consisted of timber framing. The timber columns were so constructed as to conveniently approximate to the finished design. Steel and wood lathing was used to carry the "staff." The "staff" was generally composed of 2 parts of plaster of Paris and 1 of Portland cement, to which Manilla or jute fibre was added, and these were mixed together with water till in a plastic state. This composition was then either applied direct to the laths or expanded steel sheets, or was cast into moulds, and, when thoroughly dry, nailed to the framed walls. When cast it could be sawn or planed in the same way as wood. It is alleged to withstand the weather if painted.

The white oak keys of circular cross-section were used throughout the construction in the following cases:—

(1) To make the shear connections between the individual posts of built-up columns (which are subject to direct compression and bending strain). (2) To make all tension splices of jointed timbers break joint wherever they occur. (3) To make all attachments to posts and trusses where a force parallel to these members has to be transmitted to them.

These keys, which were 2 inches in diameter, were driven into holes bored after the individual timbers had been bolted together. When the keys were all in position the bolts were tightened up. The advantage of circular keys is evident from the great saving of expense by their adoption, as but little labour is necessary; they are also speedily fixed in position, and the certainty of uniformity in their fit was certain since the holes were bored with augurs operated by compressed air. The disadvantage in

practice was found to be that when the timbers shrunk these keys could not be tightened up, and in some cases they fell out and did some damage to exhibits beneath. Life and limb being held so cheaply in the States one must not stop to enumerate the accidents that occurred to the mere public therefrom.

Square keys used as folding wedges are undoubtedly superior, since they can be tightened up; and, moreover, the pressure of the shearing strain does not develop a component laterally as with the round keys. Doubtless, therefore, these latter would have been adopted if the buildings had been required for any considerable length of time.

Roof Trusses.

The roof trusses employed were mostly of the familiar Howe type, the span of these varying with the requirements of the different buildings. The main columns measured 14 inches by 3 feet 8 inches on plan, and were composed of two posts 10 inches by 14 inches, and one post 8 inches by 14 inches, with two sets of packing pieces 8 inches by 14 inches, between. The columns supporting some of the smaller roof trusses were composed of two posts, 12 inches by 14 inches, with one set of packing pieces of similar scantling between them. Numerous oak keys, as already described, were employed in transmitting the stresses which these columns were subject to from post to post. In an exhibition, if skilfully contrived, columns internally should not interfere with the exhibit spaces.

The roofs were mostly flat, except where architectural effect necessitated them being otherwise, and composition roofing was the chief covering used.

The buildings were intended to be finished internally with plaster, but lack of funds prohibited this being fully carried out, which was fortunate from the point of view of the architect desirous of studying the construction. The main Exhibit Buildings were chiefly lighted by means of skylights, clerestories and lanterns, or "monitors," as the latter are called in the States. The Commission of Architecture fixed a uniform cornice level of 60 feet above the adopted ground level for the main buildings. This cornice level was, therefore, about equal to the height of the two orders to the Banqueting House, Whitehall, and may give some idea of the scale employed. The earlier plans suggested galleries, but the authorities in charge of the exhibit department deemed them undesirable, since very few would be likely to visit anything above the ground-floor level of such stupendous buildings.

Festival Hall.

Having thus dealt with the general structural features of the main buildings, we will rapidly consider a few of the principal buildings. The central features were the Festival Hall and Colonnade of States with the restaurant pavilions. The Festival Hall was designed by Mr. Cass Gilbert, of New York, in front of his permanent Art Building, the latter being completely screened off by the Festival Hall and Colonnade of States. It was a large circular building, 195 feet in diameter, with a large rectangular annexe containing the stage, the organ, accessory dressing rooms, and offices. The auditorium was covered by a dome, the internal diameter of which was 90 feet. A gallery was provided, and there were promenades on both sides and the ground floor. Seating accommodation was provided for 3,500, tip-up seats being generally employed in the auditorium and the first four rows of the gallery while in the remaining rows ordinary chairs were used. This building was highly decorative externally. Engaged Ionic columns were employed in the circular colonnade which stood upon a lofty podium. The great entrance with its curved pediment and crowning sculptured group was at once very ornate and imposing. Unfortunately, the great statue of Liberty raising the Veil of Ignorance and protecting Truth and Justice, which was placed above the central cascade, completely obliterated it from view when standing on the Plaza of St. Louis. The crowning feature of the building was the dome, which rested on a lofty drum of considerably less diameter than the circular colonnade. Bull's-eye openings were introduced at the junction of the dome with its drum. Originally it was intended to place a seated figure upon the dome, but in execution this was varied to a figure of Victory. The cost of this building was about 53,000.

Colonnade of States and Restaurant Pavilions.

The Colonnade of States, designed by Mr. E. I. Masqueray, was an ornamental screen, 52 feet in height and 1,500 feet in length. It was formed of a succession of

fourteen hemicycles, in which were placed statues symbolical of the States and Territories included in the Louisiana purchase. Ionic columns were used in pairs, and swags were suspended between the capitals. These had a somewhat detached appearance as seen against the sky. The restaurant pavilions, which were placed at each extremity of the Colonnade of States, were extremely esthetic in design. Mr. Masqueray was responsible for these also. From most parts of the grounds these pavilions and the colonnade were rather too much separated from each other.

Cascades and Gardens.

The borders of flowers were tastefully arranged, and changed with the seasons. These cascade gardens, perhaps, attracted more attention than any other decorative feature of the Exhibition. At night the cascades were illumined by means of three sets of incandescent lamps, which changed color and anon from white to red and green.

Art Buildings.

The Art Buildings made a majestic architectural group on the hill behind the Festival Hall and Colonnade of States, and consisted of four distinct buildings, three of which represented a total northern frontage of 830 feet. The central building is of fireproof construction, and remains as a permanent public picture gallery, being a lasting monument of this vast Exhibition. It is 340 feet long and 160 feet wide, and contains a large central hall for sculpture, with galleries on either side for pictures and other works of art. During the exhibition period the main building was occupied entirely by exhibits from the United States. As already mentioned, it did not form a part of the main picture of the Exhibition. The reason given was that this building is of buff-brick, which did not harmonise well with the ivory white staff of the exposition buildings. The temporary structures, each measuring 422 feet by 200 feet, on either side of the permanent building, were to some extent fire-resisting. The Ionic order was employed in these buildings, and the portico of lofty Corinthian columns to the central building accentuated the main entrance. The fourth building was a pavilion, 200 feet by 100 feet on plan, for sculpture by masters of international reputation, and was situated on the fourth side of a court formed by the three Art Buildings already mentioned. The cost of the entire group was over 210,000.

United States Government Building.

The building erected to house the United States Government exhibits stood on high ground at the eastern end of the Grand Transverse Avenue. It was approached by three great flights of steps, in addition to which gentle inclines led to the terrace level. The main façade was some 750 feet in length, and the central entrance portico, with its coupled Ionic columns, was connected to end pavilions by a colonnade of Ionic columns 45 feet high and 5 feet in diameter. Above the main cornice level an attic 5 feet in height was introduced, and it will be noticed that in the case of the central entrance portico the pediment was placed above this attic, thus giving importance to the main entrance. A low dome, 93 feet in diameter, was a prominent feature of the roof, and in general character it suggested that of the Pantheon, Rome, as the *motif*. The general design of the building had a breadth of treatment and unity of detail in keeping with its purpose, and excellent opportunities were afforded for sculptured ornament. This building was the only instance in which the roof was carried by steel trusses, 175 feet in span, at intervals of 5 feet. The architect was James Knox Taylor, supervising architect of the Treasury Department, and the cost was some 73,000.

Main Exhibit Buildings.

We can now come to the Main Exhibit Buildings. I have already mentioned that the general scheme was decided upon by a commission of architects representing fine firms, and each of these firms was entrusted with the design of one of these vast palaces. We have also noted that the Division of Works designed the construction and controlled the erection of the same buildings. Thus the architects were responsible only for the elevations—an altogether unsatisfactory state of affairs, which can only add to the alienation of the two factors of our accepted definition of architecture:—"Design in beauty and build in truth."

(To be concluded.)

UNIVERSITY COLLEGE ARCHITECTURAL SOCIETY.

THE University College Architectural Society, which has recently been formed, held its first meeting at University College, Gower Street, on Thursday, April 6, when Mr. B. O. Fricker read a paper on "Glass and Its Application to Domestic Glazing." Mr. Fricker first described in detail the manufacture of sheet and plate-glass, explaining the materials used and the different processes each has to go through, and then explained the fixing, cutting and leading of glass. He gave some useful advice regarding the size of panes, comes, &c. At the conclusion of the lecture he showed a number of lantern-slides, the most interesting of which were from photographs taken by him inside a glass-house, showing workmen engaged in the different processes he had described.

The meetings will be held fortnightly, and all the papers to be read will deal with practical subjects. The next paper will be by Mr. E. J. Fowler, on "Architectural Lead-work," to be followed by one by Mr. A. C. Hobbs on "Reinforced Concrete." The secretary of the Society is Mr. E. J. Whitley.

GRAY'S INN.

THE following memorial has been presented to the Benchers of Gray's Inn by the Society for the Protection of Ancient Buildings:—"We, the undersigned, have learnt with deep regret that the Benchers of Gray's Inn have decided to demolish No. 15 Gray's Inn Square, and we therefore earnestly and humbly beg that the Benchers will spare the building, on the grounds of its exceptional beauty and the charm which it lends to Field Court, which, with the beautiful wrought-iron gates and other pleasant surroundings, is one of the most picturesque spots in London." About 150 names are appended to the memorial, including those of Sir J. C. Robinson, Lord Balcarras, M.P., Mr. Hamo Thornycroft, R.A., Mr. Richard Garnett, C.B., the Hon. Percy Wyndham, Mr. Walter Crane, R.W.S., Sir Philip Burne-Jones, Sir Alexander Condie Stephen, Mr. Lancelot Speed, Sir Thomas Barlow, M.D., Lord Cathcart, Mr. R. Norman Shaw, R.A., Mr. H. R. Graham, M.P., Mr. T. J. Macnamara, M.P., Mr. John Belcher, A.R.A., Mr. W. Holman Hunt and Mr. Edward Moon, M.P.

CARNARVON CASTLE.

THERE is rivalry in Wales concerning the selection of a site for the contemplated National Museum. Each competitor claims to possess unique reasons for selection, Swansea and Cardiff have wealth to bestow on the museum, but Carnarvon has the great advantage of possessing the historic castle which can easily be adapted to the required purposes. We lately mentioned that Mr. Walter Thomas, president of the Society of Architects, had been invited to examine the building. In his report he says:—

"In accordance with your request, I have made a thorough survey and examination of Carnarvon Castle and its ten towers with a view to advising you as to the practicability of housing within its walls the National Museum of Wales. In my opinion the idea is an excellent one, the castle being in itself perhaps the most interesting object, from an historical and antiquarian point of view, in the Principality, and the setting it would afford to the exhibits would be unrivalled in any ancient or modern institution of this character. The towers contain some very spacious chambers, and from the corbels, recesses and other indications it is easy to form an accurate idea of the construction of the original floors and roofs, and if these were reconstructed a very excellent group of rooms would result—somewhat isolated, it is true, but for this very reason lending themselves to the more thorough and scientific classification of the exhibits. The lighting difficulty could be overcome by making the roofs altogether of glass and treating the upper floors as galleries, leaving a large space in the centre of each for access of light to the lower rooms. Great care would have to be exercised to keep the work of restoration free from any taint of vandalism; there should not be the slightest interference with the ancient fabric, and the restoration should be carried out as faithfully as possible on the lines of the original structure. In the ten towers it would be possible to construct at least twenty rooms, the largest having an area of about 700 square feet and the smallest an area of about 270 square feet (the average area being about 500 square feet). This accommodation

would probably be sufficient for all present needs, and when more room is required I should advise the erection of additional buildings on the sites, still plainly discernible, of the banqueting hall and other chambers within the castle. It has been impossible, in the limited time I have had, to go very closely into the question of cost, but I think an expenditure of between 800*l.* and 1,000*l.*, as an average on each tower, would be necessary."

The committee have also obtained the co-operation of Dr. Forbes, the curator of the Liverpool Museum, who says:—"I am convinced that the various tower rooms, from their form and dimensions, will each afford ample floor space for the perfect display with much artistic effect of a large series of objects. The side windows already existing with a good lantern-roof (as you suggest) ought to make the lighting of the chambers ideally perfect. The altitude of the towers will enable each of them to be provided—when it is thought necessary—with a well lit, commodious upper gallery. The quaint corridors connecting the towers would afford (eventually) covered passage-way from one to the other. In the spacious courtyards of the castle, monoliths or other large objects suitable for outdoor exhibition and whose removal from houses or other original sites might become necessary, could be splendidly displayed and preserved for all time. The ten towers, when restored, would provide ample accommodation for the collections for many years to come; when, however, this space is exhausted there would still remain to be added, by rebuilding upon the old existing foundations, the banqueting and several other halls and chapels, which could not be excelled in form and dimensions and general suitability as picture or other galleries."

ANCIENT ARCHITECTURE AT GREAT ZIMBABWE, RHODESIA.*

I WISH to direct attention to what is admitted to be the greatest archæological wonder of the Southern Hemisphere—the ancient temples of the Great Zimbabwe.

This group of prehistoric buildings lies in South-east Africa, at over 200 miles from the shore of the Indian Ocean at Sofala.

Its name is derived from *Makuru Zimbabwe*, or "The Great Buildings of Stones," the title applied to these ruins by the native race of Makalanga, or "People of the Sun," who inhabit Mashonaland and the country of the Great Zimbabwe.

Zimbabwe was known to the very early Mediæval Arab traders on the Mozambique coasts, who gave descriptions of these ruins to the Portuguese, and in 1552 De Barros made the first recorded mention of their existence.

From Mediæval times until 1868 the existence of these buildings appears to have become completely lost sight of. In that year Adam Renders, an elephant hunter, rediscovered the Great Zimbabwe, but so scanty and so highly coloured were the descriptions of these buildings then given that the scientific world looked askance at their discovery.

It was not until 1871, when Dr. Karl Mauch examined these ruins, that their discovery was treated seriously by the archæologists of Europe. It was then ascertained that their discovery by Adam Renders was but a rediscovery of these ruins, and that the archives of the Vatican and of Lisbon contained earlier information concerning them.

In 1891 Mr. Theodore Bent examined the ruins and embodied his report in "The Ruined Cities of Mashonaland." His account is exceedingly valuable and reliable, but, unfortunately, he only saw the ruins in their buried condition. Later other writers, including Dr. Schlichter, a German archæologist, and Sir John Willoughby, added further to our knowledge of this group of ruins.

In 1902 I explored the Great Zimbabwe on behalf of the Government of Rhodesia. This work extended over two years, and the report to the Government on my explorations and discoveries is now embodied in "Great Zimbabwe," a volume forming a natural sequence to "The Ancient Ruins of Rhodesia," of which I shared the authorship with the late Mr. Neal.

Since my return to England last autumn I have had opportunities of discussing before leading scientific bodies at home several phases of the Zimbabwe problem, such as the origin of the ruins, the evidences of ancient civilisation and arts, the Mediæval and modern records concerning

them, and the progress made within recent years researches regarding these ancient monuments.

Ancient Architecture.

But among the many aspects from which the Great Zimbabwe problem may be considered, there was one which I had not as yet submitted for discussion, and that was the all-important subject of the architecture and construction of these buildings as represented by the temple at Zimbabwe.

In the consideration of their style of architecture and methods of construction will, in most probability, be found a reliable key to the final solution of the enigma that the marvellous structures present to the archæologist. In the first it was necessary to bear in mind that the whole of Southern Rhodesia lying between the Zambesi and Limpopo rivers yields abundant evidence that in some prehistoric times the country was occupied by a dense population of colonists, thought to be Semites of South Arabia, who were engaged in a gold-mining industry of almost inconceivable extent, and which represented an occupation extending over very many centuries of time.

Ancient gold mines exist in all the auriferous districts of Southern Rhodesia, covering an area of 600 miles from east to west, and 500 miles from north to south. Associated with these ancient gold mines are buildings undoubtedly erected for the main purpose of defence, obviously suggested by their architectural features and massive construction, that these prehistoric colonists occupied by force in a hostile country. Certain of these buildings are not believed to have been erected to serve the further purposes of religious worship and solar and astral observation. Some of these structures evidently were capital centres of gold-mining districts, others protected extensive gold workings, while others are found in chains protecting certain well-defined routes throughout the country and also leading towards the coast.

The Great Zimbabwe, by its evident importance and to a great extent, was undoubtedly the ancient metropolitan centre for the whole of the country. There are at least five hundred distinct ruins of buildings throughout Southern Rhodesia, and of these descriptions at least two hundred are to hand. These buildings are of all ages and periods extending from prehistoric times down to within the last few centuries. These various classes of ruins present different types of architecture and yield relics belonging to different periods of antiquity, and generally occupy distinct areas of country. But it is with the most ancient type of buildings, as represented by the Great Zimbabwe, that archæologists are most concerned.

Possible Age of Zimbabwe.

There appears to be unanimity in opinion among many leading scientific men of Britain, Germany and France, that the age of the Elliptical Temple at Great Zimbabwe, and the associated ruins of a similar style of architecture and construction, dates back to some period between 1600 and 1100 B.C. This opinion is based on several grounds, some of which may briefly be stated:—

1. The striking parallelisms existing between the architecture and plan of the Great Zimbabwe and those at least of two ancient temples in South Arabia, as to the remoteness of antiquity of which latter there is no doubt.

2. The orientation of the three Zimbabwe temples and of some score of other ruins in Rhodesia determined independently by British and German scientists, all point to the probable age of many of the buildings being from 1600 to 1100 B.C.

3. The discovery at Zimbabwe of the zodiacal signs showing the sun in Taurus, which astronomers assert represents a period which could not date later than 1600 B.C.

4. The undoubted practice at Zimbabwe of nature worship of an exceedingly old cult believed to synchronise with that period.

5. The absence from Zimbabwe of all sign-writing, the earliest inscriptions found in any Phœnician temple being not older than 700 B.C.

6. The evidences at Zimbabwe of ancient civilisation and arts whose only parallel in many respects, especially in their associations, is to be found in the ancient kingdoms of South Arabia.

7. The evidences of ancient gold-mining operations distinct from those of Mediæval Arabs and Portuguese, of an inconceivably vast extent, showing a total output of gold in prehistoric times of at least 75,000,000*l.* sterling, while mining operations geologists and mining experts show were

* A paper by Richard N. Hall, F.R.G.S., read at a meeting of the Society of Arts on April 5.

conducted at a most remote period, well synchronising with the estimated ages of the oldest of the Zimbabwe buildings.

8. The presence throughout Southern Rhodesia, and especially on the ancient mines and ruins area, of trees and plants which are not indigenous to South-East Africa, and which still bear their fruit in the early spring. But additional internal evidences from the ruins and mines in Rhodesia could be advanced, also external evidences obtained by scientific research in the Near East, the Mozambique coasts and Madagascar, from ethnological and anthropological examinations, and also from Arab traditions.

With these evidences should also be taken into account the inability of scientific men, and especially of geologists, to point to any country or combination of countries other than Rhodesia which could have yielded the enormous wealth of gold which, according to ancient Roman and Grecian historians, and the Scriptures and modern research was so plentiful in all the ancient empires of the Near East.

Rhodesia, it is now admitted, contains the most extensive ancient gold mines known to the world.

Having suggested in mere outline the probable ages of the Zimbabwes, I will now deal with their appearance, plan, architecture and construction.

Appearance of Ruins.

Immediately on viewing the Great Zimbabwe for the first time every visitor, even the most casual, is greatly impressed by the extraordinary massive proportions of its grandly sweeping walls. Undoubtedly the Elliptical Temple is a most awe-inspiring structure. Its appearance powerfully suggests the Near East.

The European student of architecture, to entertain any adequate idea of the oldest type of forts and temple-forts in Rhodesia, must first dismiss from his mind all conceptions of the distinctive features of Grecian, Roman and Egyptian styles of architecture.

I was assured by professors and students of Egyptian archæology that the plan, architecture and construction of Zimbabwe finds absolutely no parallel or similarity with the plan, architecture and construction of any known Egyptian building. This is obvious to any one visiting Zimbabwe.

In Rhodesia the ancient architecture provides no sculptured columns and ornate capitals, no arches and no basilica, but conical towers and monoliths enclosed within stupendous walls laid on an elliptical plan—all unroofed from the very date of their construction and all open to the light of heaven.

So far as archæological researches lead, the ancient buildings in South Arabia—of Yemen, the ancient empire of Saba—alone present any parallel with those of Zimbabwe, and in several of their most important features of architecture an identity is believed to have been established.

Plan.

The plan on which the oldest of the Zimbabwe buildings throughout Southern Rhodesia are laid is always elliptical. Walls are built on curves, and the ends of walls, sides of entrances and buttresses are rounded. The angular form of building is absent, and is only found in the case of structures of obviously much later periods.

Main Walls.

The walls are very substantially built with bases averaging from 7 feet to 16 feet in width, and are beautifully and most skilfully constructed, not only on the exterior faces, but in the internal portions. Levelling instruments must have been used at Zimbabwe.

Each wall has a lean-back or batter-back on either face. Thus the main east wall of the Elliptical Temple is 16 feet wide at its base, but at a height of 30 feet its summit is 8 feet in width.

The average batter-back of high walls of the oldest type is 1 in 10 to 1 in 8, though 1 in 6 is often met with in lower walls.

Building Materials.

The building material employed at Zimbabwe is local granite in blocks, with faces averaging 9 by 7 inches. Many of the blocks have been rudely squared by the use of diorite hammers, some having been cut with metal tools.

Building Material.—How Obtained.

One might ask how the ancients obtained the enormous quantity of building material. Was it by quarrying in the local hills? I am of opinion that no quarrying, in the

ordinary sense in which the word is employed, was carried on by the ancients. All the evidences are strongly to the contrary. Caves occupied by the ancients could have been considerably enlarged and their accommodation greatly increased by simple quarrying operations, but the caves remain in their natural state. Rock protuberances in the floors of some of the ruins have not been removed, but permitted to remain, even to the extent of inconveniencing the occupiers. The hills in the Zimbabwe district show no signs of any quarrying operations on the part of the ancients.

The hills and cliffs which abound round the Zimbabwe valleys are granite. These are mainly whaleback in shape, and layers of granite in some stage of decomposition cover the faces of these hills and whaleback cliffs with gigantic scales, the layers being about 6 to 9 inches in thickness. At the bases of these hills and cliffs are hundreds of tons of scale rocks or slabs, broken fairly square by their fall from great heights. These are flat top and bottom, and only require slight trimming, if any, on their sides to make them fit closely together, and so form the ordinary block of granite as seen in the walls. These gigantic scales from the faces of the cliffs are always falling, especially after long rains; the roar and crash of these falling masses of slabs can at times be heard in several directions. No doubt the ancients finding so conveniently situated these extensive masses of fallen scales of rock, almost suiting their purpose without much labour except for their transport for two or three miles only, used these blocks in building, trimming their sides when necessary. Possibly they assisted to loosen these slabs from their original position on the cliffs in order to increase the supply of materials.

The granite used in the walls is all local, but lithologists state that the ruins on Zimbabwe Hill (350 feet) are mainly built with a local granite which does not correspond to the class of granite yielded by the formation constituting the hill itself. We may be assured that the great majority of these blocks in the extensive "Hill Ruins" was carried up to the summit from a distance of two or three miles. This implies an employment of slave labour of great proportions, but the ruins elsewhere, as well as the ancient gold mines, all point unmistakably to the same conclusion. At least over 100 tons of slate used in the buildings have been carried from a distance of ten or twelve miles, the nearest point of the slate formation to Zimbabwe being about ten miles.

The soapstone extensively found at Zimbabwe must have been imported from a distance of twelve or twenty miles, that being the nearest soapstone formation to Zimbabwe. The huge granite monoliths are believed to have been carried by slaves from the Lumbo district some two miles distant. Each of these would have required an immense number of slaves even to lift it from the ground.

Dry Masonry.

No cement or mortar has been used in the construction of the walls, all these being of dry masonry. The ancients extensively employed a fine granite cement for floorings, steps and dadoes. In their more important dado work the dadoes have had an outer layer of whitish soapstone clay brought to a high polish.

Passages.

One extraordinary feature at Great Zimbabwe is the extent and number of passages, amounting, so far as they have been discovered, to a length of over 5,000 feet, of which over 2,000 feet in length were discovered during the recent explorations. The heights of the side walls are from 5 feet to 30 feet, while some are sunk below the level of the ground. All are very narrow, some being only shoulders' wide.

Each temple has an important passage; these are conjectured to have been the approach of the priests to the inner shrines or sacred enclosures. The lowest floors of these passages yielded great quantities of religious emblems and articles of gold.

At Zimbabwe the ancient architects laid down a splendid system of drainage, which must have been contemplated before the outer main walls were erected. The buildings were open and never roofed, but by this system the flooding of the temple during sub-tropical rains was prevented.

The American Government recently invited Great Britain, Germany and France to appoint engineers to act on the Panama Canal Commission. The invitations have been accepted.

SURREY ARCHÆOLOGICAL SOCIETY.

THE fiftieth annual report of the Council of the Surrey Archæological Society states that by the lamented decease in the early part of the year of H.R.H. the Duke of Cambridge, K.G., the Society lost one who had been its patron since the year 1856. The Council had been much gratified by the honour done the Society by H.R.H. the Duchess of Albany consenting to hold the office which had thus been made vacant. A meeting in celebration of the jubilee of the Society was held at Guildford on April 28, and was very largely attended by members and their friends. The annual excursion was held on July 13, the meeting-place being Leatherhead, whence Mickleham, Fetcham and Ashted were visited. The Council tender the thanks of the Society to all who assisted in rendering these meetings successful. During the year the annual volume of the "Collections" for the preceding year's subscription was duly issued. The annual volume for the past year was in active progress, and would be devoted to Mr. Harold Brakspear's important account of the conventual buildings at Waverley Abbey, as revealed by the recently concluded excavations. The Council express its indebtedness to members for contributions amounting to 42*l.* 13*s.* 6*d.* towards the reduction of the debt of 138*l.* 6*s.* 8½*d.* upon the Waverley Abbey excavation fund. It was earnestly hoped that members who had not yet sent a subscription would come forward with their contributions, however small, towards the reduction of this serious debt, which now stood at 95*l.* 13*s.* 2½*d.*, in order that the Society might be far more generally represented by its members in the most important archæological undertaking it had yet carried out. The Council was most desirous that the debt should be paid off during the current year, and, as a contribution towards this end, would recommend at a special meeting to follow the appropriation of the sum of 40*l.* from the reserve fund. With reference to the resolution which was passed at the annual meeting in March last against the proposed destruction of the crypt on the south side of the High Street, Guildford, the Council had been much gratified to learn that steps had been taken which had resulted in the preservation of this interesting specimen of Mediæval architecture. The Council also referred to the successful agitation against the threatened demolition of Whitgift's Hospital of the Holy Trinity in Croydon. The Council was pleased to report that in consequence of a large accession of new members, due chiefly to the interest aroused in the celebration of the Society's Jubilee, there had been a considerable increase in the Society's members. Nevertheless the Council continued to urge upon members the necessity of introducing their friends to the Society as new members, if the present standards were to be maintained, and also to point out that the Society's present numbers could not yet be said to represent adequately so populous a county as Surrey. The number of members was 436, viz. annual 349, life 86, honorary 1, the total increase during the year being 29.

WORKMEN'S COMPENSATION IN COLONIES.

THE effect of colonial legislation as regards the persons entitled to compensation may be briefly stated. New Zealand (1900) adopts the same list of "dependants" as the English Act of 1897. The same observation applies to the South Australian law (1900) except that it seems to exclude step-parents. Western Australia (1902) and British Columbia (1902) include "brother and sister." All of these Acts include the general qualification, that the person to be a dependant must have been wholly or in part dependent on the earnings of the injured person at the time of his death.

The definition of "workman" in the Acts above mentioned is substantially identical with that of the Act of the United Kingdom. It should be observed, however, that two of the Acts, that of New Zealand (1900) and British Columbia (1902) include in the definition the words, "whether the employment is on land or on any ship or vessel of whatsoever kind and however propelled, in any navigable or other waters within (the colony) or the jurisdiction thereof."

As regards compensation to the injured workman in the case of non-fatal accidents, the New Zealand Act (1900) follows the precedent of the Act of 1897, except that the sum of 2*l.* is substituted for 1*l.* as the maximum of the weekly payments, and, on the other hand, it provides that

the total liability of the employer under this provision shall not exceed 300*l.* This latter provision must have a very important bearing on the difficult question of commutation of weekly payments.

By the Act of 1902 an important modification was made by substituting one week for two as the interval between the happening of the accident and the commencement of the weekly payments. A further Act, No. 88 of 1903, added the proviso that no payment shall be made in the first week in any case where the partial incapacity of the worker does not continue for a longer period than two weeks.

The same Act also made some alteration in the language of the provision for the calculation of "average weekly earnings." These alterations, however, hardly seem sufficient to meet the difficulties which have been experienced in the working of the Act of 1897.

As regards compensation to dependants in case of fatal accidents the New Zealand Act of 1900 follows the terms of the English Act, except as regards the various amounts. It substitutes for the minimum amount of compensation 200*l.* for 150*l.*, and 400*l.* for 300*l.* as the maximum. It also substitutes 30*l.* for 10*l.* as the maximum for medical attendance and burial expenses when there are no dependants.

The South Australian Act (1900) follows the same lines. The important variations from English law as regards amounts are that while (unlike the New Zealand law) it follows the English provision of 1*l.* as the maximum weekly payment, it introduces a minimum of 7*s.* 6*d.* as the amount of the weekly payment in cases of total incapacity. It enacts the maximum of 300*l.* as the total liability of the employer for weekly payments, a most important modification of the (U.K.) Act of 1897, which provides no such limit. This precedent, as has been shown, was adopted by the New Zealand Act of 1902.

Western Australia Act (1902) follows New Zealand, adopting 2*l.* as the maximum of weekly payments, and also (like the colonies already mentioned) fixes 300*l.* as the maximum liability of the employer. It also adopts the two weeks' interval before the payment of compensation begins. In case of death the minimum and maximum figures of the compensation payable to dependants are the same as under the New Zealand Act of 1900. Where there are no dependants, the maximum of the reasonable expenses for medical attendance and burial is fixed at the large sum of 100*l.*

British Columbia (1902) adopts the two weeks' interval, and the sum of 1,500 dols. as the maximum limit of liability for weekly payments. In case of death the minimum and maximum limits of the amount of the compensation are 1,000 dols. and 1,500 dols. respectively. In all other respects the provisions follow closely those of the Act of the United Kingdom as regards the amount and mode of assessment of the compensation.

NATIONAL PORTRAIT GALLERY.

THE following portraits have been added to the National Portrait Gallery:—

Donations.

Sir Charles Lyell, Bart., F.R.S. (1797-1875), the eminent geologist; painted by Lowes Dickinson and presented by Mrs. Henry Lyell.

The Rev. William Mason (1724-97), poet and divine; a miniature painting, artist uncertain; presented by the Hon. Philip Stanhope, M.P., a trustee of the Gallery.

Charles Robert Darwin (1809-82).

John Milton (1608-74), plaster-bust modelled by Horace Montford, and presented by the artist, the bust being modelled from the portrait-head at Christ's College, Cambridge, for the statue recently erected at Cripplegate.

Frederick Denison Maurice (1805-72), the eminent theologian and divine; a death-mask taken and modelled by Thomas Woolner, R.A.; presented by Mr. Lowes Dickinson.

Bequests.

Sir Herbert Benjamin Edwardes, K.C.B. (1819-68), administrator in North-West India; painted by Henry Moseley and bequeathed by Lady Edwardes.

William Henry West Betty (1791-1874), the Infant Roscius, represented as "Young Norval" in the play of "Douglas;" painted by John Opie, R.A., and bequeathed by his son, Mr. Henry T. Betty.

Purchases.

Edward Stillingfleet, D.D. (1635-99), Bishop of Worcester and theological writer; attributed to Mary Beale.

Nicholas Heath, D.D. (1501?-78), Archbishop of York and Lord Chancellor; painter uncertain.

William Whewell, D.D. (1794-1866), professor of natural philosophy and Master of Trinity College, Cambridge; plaster-cast from a bust modelled by E. H. Baily, R.A.

John Baskerville (1706-75), the eminent printer; painter uncertain.

George Brydges Rodney, first Baron Rodney, K.B. (1719-92), the famous admiral; a copy from the painting by Sir Joshua Reynolds at Petworth.

George Stubbs, A.R.A. (1724-1806), the animal painter; painted in water-colours by Ozias Humphry, R.A.

Caleb Whitefoord, F.R.S. (1734-1810), diplomatist and man of letters; painted by Sir Joshua Reynolds.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

AT the meeting of this Society on Monday the first communication was a report on the excavation by the Society of the Roman Fort of Rough Castle on the Antonine Wall, near Falkirk. It is a square with rounded corners, measuring 223 feet each way in the interior space, which is surrounded by ramparts of earth and turf, with a bottoming of stones 20 feet in breadth, with two trenches in front on three sides, the fourth side being formed by the Antonine Wall, bounding it on the north. There are four gates. This system of defence is unique in Britain, but is described by Cæsar as having been used in his Gallic campaign. Sir Arthur Mitchell, K.C.B., contributed a supplementary list of travels, tours, &c., in Scotland; the Hon. John Abercromby gave an exhaustive analysis of the ornament used in the decoration of the drinking-cup or beaker class of sepulchral pottery; the Rev. Robert Paul, Dollar, gave some notes on the prehistoric relics found on Tent's Muir, Fife, of which he exhibited a collection made by himself, and consisting chiefly of flint arrow-heads and small chipped implements, such as knives and scrapers. Mr. John Sinclair, F.S.A.Scot., gave a detailed description of the Holyrood Fore-yett, or forework to the Palace, originally built by James IV.; and Mr. A. O. Curle, W.S., gave a notice of a hog-backed and two coped monuments in the graveyard of the old church of Nisbet, Roxburghshire.

TESSERÆ.

Sir Nathaniel Bacon.

AMONG the artists who lived in the time of Elizabeth should be included Sir Nathaniel Bacon, who was half-brother of Francis Bacon, Lord Verulam. He travelled to Italy, and studied painting there, but his manner and colouring approach nearer to the style of the Flemish school. Peacham, in his book on "Limning," says:—"But none in my opinion deserveth more respect and admiration for his skill and practice in painting than Master Nathaniel Bacon of Broome in Suffolk (younger son to the most honourable and bountifull-minded Sir Nicholas Bacon), not inferior in my judgment to our skilfullest masters." At Culford, where he lived, were preserved some of his works; and at Gorhambury, his father's seat, was a large picture in oil by him of a cook-maid with dead fowls, admirably painted, with great nature, neatness and lustre of colouring. In the same house was a whole length of him by himself, drawing on a paper; his sword and pallet hung up; also a half-length of his mother by him. At Redgrave Hall in Suffolk were two more pieces by the same hand, which afterwards passed into the possession of Rowland Holt: the one, Ceres, with fruit and flowers; the other, Hercules and the Hydra. In Tradescant's museum was a small landscape, painted and given to him by Sir Nathaniel Bacon.

Inn Signs.

In early times the town residences of the nobility and great ecclesiastics were called inns, and in front of them the family arms were displayed. In many cases these inns were afterwards appropriated to the purposes of the modern hotel, affording temporary accommodation to all comers. The armorial decorations were retained, and under the names of signs, directed the public to these places of rest and refreshment. On calling to mind the signs by which the inns of any particular town are designated, a very great majority of them will be recognised as regular heraldic charges. In addition to the full armorials of great families, as the Gordon Arms, the Pelham Arms, the Dorset

Arms, we find such signs as the Golden Lion, Red Lion, White Lion, Black Lion, White Heart, Blue Boar, Golden Cross, Dragon, Swan, Spread Eagle, Dolphin, Rose and Crown, Catherine Wheel, Cross Keys, *cum multis aliis*, abundant everywhere. These were originally, in most cases, the properly emblazoned armories of families possessing influence in the locality, and frequently the inns themselves were established by old domestics of such families. But owing to the negligence of mine host, or the unskilfulness of the common painter who from time to time renovated his sign, the latter often lost much of its heraldic character; the shield and its tinctures were dropped, and the charges only remained; while, by a still further departure from the original intention, three black lions, or five spread eagles, were reduced to one. A house in the town of Lewes was formerly known as the Three Pelicans, the fact of those charges constituting the arms of Pelham having been lost sight of. Another is still called The Cats, and few are aware that the arms of the Dorset family are intended. In villages innumerable instances occur of signs taken from the arms or crests of existing families, and very commonly the sign is changed as some neighbouring domain passes into other hands. There is a kind of patron and client feeling about this—feudality some may be disposed to call it—which a lover of old England is pleased to contemplate.

Tombs in Churches.

The actual burial-place of the founders of churches or chapels was the porch; for it was formerly the custom for worshippers on entering the sacred edifice to pray for the souls of its founders and benefactors. Thus Leofric, Earl of Mercia, and his celebrated countess, Godiva, were buried in the porch of the abbey church, Coventry, which they had founded. The heads of the religious houses were generally interred in their chapter-houses or their cloisters; and rectors or vicars in the close vicinity of the altar, or in the chancel of the church to which they belonged. Lords of manors and patrons were often interred in the chancel. The most obvious guides to the date of tombs are of course inscriptions. As, however, many of these exist without giving any information regarding the time at which they were cut, consisting simply of an epitaph, the following facts, taken in connection with other evidences presented on the tomb itself, will lead to a near conjecture as to its age. During the first twelve centuries, churchyard epitaphs were all written in Latin, and the first inscribed funeral monuments are those bearing the names of Romanised Britons in Cornwall or Wales. These are written in capital letters, but a small hand was introduced about the seventh century. Lombardic capitals became general on tombstones in the thirteenth century, when epitaphs in the French language began to appear, which continued to be used till the middle of the fourteenth century, generally in German text letters. From that period vernacular English and Roman print have been commonly employed for monumental inscriptions; though the clergy and learned have, as might be expected, always preferred the Latin.

GENERAL.

The Salon Jury for architecture will this year consist of MM. Vaudremér, Laloux, Pascal, Scellier de Gisors, Guadet, Nénot, Daumet, Paulin, Moyaux, Girault, Raulin, Bonnier, Deglane, Redon.

The Brighton Town Council have advanced Mr. Weller, deputy borough surveyor, to the position of borough surveyor, in succession to Mr. May. The salary is 500*l.* a year. In all cases of large undertakings expert advice will be called in.

A Meeting of the Royal Institute of the Architects of Ireland was held on Monday, when Mr. George Hubbard and Mr. A. W. S. Cross read papers on the statutory qualification of architects. A resolution was adopted approving of the principle of registration.

The Workshop Urban Council received 116 applications for the post of surveyor, viz. seventeen by surveyors to local authorities, forty-five by assistants to surveyors, fifty-two by architects in private practice and two by local candidates. The general purposes committee recommended that Mr. George Rawson, Workshop, be appointed surveyor at a salary of 150*l.* per annum, and on Tuesday the recommendation was confirmed.

The National Art Survey scholarships of 50*l.* each for six months travelling and sketching of old Scottish buildings in connection with the Edinburgh School of Applied Art have just been awarded to the following architectural students:—Mr. Thomas Linton, with Messrs. Peddie & Washington Brown, and Mr. Thomas Aikman Swan, with Mr. T. Duncan Rhind.

The Board of Managers of the London Institution say that after a very careful consideration of the scheme of amalgamation with the Society of Arts, they recommend its adoption to the general meeting. They feel sure that it insures the carrying on of the London Institution on its old lines and the continuance without a break of the work it has always done in the promotion of science, art and literature.

At the Grimsby Police Court on Monday, Mr. Arthur Gooseman, architect, was summoned for obstructing the highway by leaving sand thereon. The defendant said he was not liable, not being the contractor, but in order to save time would plead guilty. The chief constable thereupon withdrew the summons on payment of 7*s.* 6*d.* costs.

Canon Prior, of St. Peter's Church, Mansfield, says:—"The renovation of the belfry has been carried out with real artistic taste. The plaster has been stripped off and the grand old Norman stones pointed. The time is not far distant when the condition of the interior of the church will require attention. The plaster has perished in many places and the question will arise: Why not treat the whole interior as the belfry, and as Edwinstowe has been done? Certainly the tower can be so treated, but it remains to be seen whether the stones under the plaster in the aisles and chancel are big enough to be pointed or whether they are mere rubble."

At the Park Presbyterian Church, Highbury, on Sunday the minister commenced a series of discourses on great pictures, dealing first with Dürer's "Melancholia." Each worshipper was given a photographic reproduction of the picture so that the points of the sermon might be followed.

The University of Aberdeen announce that the Blackwell prize of 20*l.* will be awarded for the best essay on the following subject:—"The Causes and Conditions that have determined the Sites of the Great Cities of Europe." The prize is offered to open competition. Essays must be lodged with the secretary of the Senatus on or before January 1, 1907.

The Very Rev. Arthur Perceval Purey-Cust, D.D., celebrated last week the twenty-fifth anniversary of his installation as Dean of York. The Chapter of York Minster made him a presentation of an illuminated address. Since he became Dean of York Dr. Purey-Cust has raised 30,000*l.* towards the restoration of the fabric of the Minster, and has restored the lady chapel for the purpose of public worship.

The Lord Mayor of Manchester (Mr. T. Thornhill Shann) left the town hall last week, and will be absent for three weeks. In company with three members of the art gallery committee he will visit the galleries and museums of Brussels, Antwerp, Hamburg and other places on the Continent. The result of the visit will be embodied in a report to the art gallery committee.

Mr. Justice Farwell is expected to deliver his judgment in the Stonehenge case on Thursday next.

The Council of Birmingham University have decided to establish a professorship of civil engineering.

The Aberdeen University have passed honorary degrees of LL.D. on Professor Alberto. Gilli, Director-General of Museums and Galleries of the Vatican; and Edwin Robinson, Keeper of Antiquities at the Museum of Fine Arts, Boston.

The Hamilton Parish Council have selected plans for the competitive prizes for the proposed new Parish Council Chambers at Hamilton:—(1) "Parochial," estimated cost 2,750*l.*; (2) "Cadzow," estimated cost 3,475*l.*; (3) "Brandon," estimated cost 3,600*l.* By nine to six the committee were authorised to appoint a measurer and thereafter agree on the plan to be accepted.

Tidswell Church, sometimes called "the cathedral of the Peak," has been recently restored. The work included the removal of a modern gallery erected in 1826. In addition, oak porches, a screen and doors have been provided. The twelve panels of the new south doors are cut from an oak beam which was taken from the old Guildhall. The six upper panels are decorated with traceried carving. The work has been carried out from plans by Mr. J. Oldrid Scott.

The Metropolitan Asylums Board at a recent meeting discussed a recommendation by the works committee that the commission to be paid to Messrs. A. & C. Harston, in respect of the additional buildings which it was proposed to erect at the Joyce Green hospital, in accordance with the plans already approved by the Managers, should be at the rate of 5 per cent. on the total cost of the works. A member stated that the matter had been discussed at a former meeting, and the commission was then fixed at 4 per cent. He moved an amendment to substitute "4 per cent." for "5 per cent." The recommendation was eventually adopted.

The Secretary for Scotland (the Marquis of Linlithgow) received at his office on the 7th inst. the Lord Provost of Edinburgh, Sir Robert Cranston; Sir James Guthrie, president of the Royal Scottish Academy; Professor Chrystal, Mr. John Ritchie Findlay, Mr. Alexander W. Inglis, secretary to the Board of Manufactures; and Mr. Ewan MacPherson, secretary to Mr. Akers Douglas's departmental committee. A prolonged discussion took place on the various projects that have been advanced for enlarged accommodation for the National Gallery, for the Royal Scottish Academy and for the Royal Society.

The Award in the limited competition for the Crookes Congregational church, Upper Springvale Road, Sheffield, has been published by the assessor. Mr. E. M. Gibbs gives the first and second premiums of 20*l.* and 10*l.* to Mr. W. J. Hale and Mr. W. T. Campsall respectively. The report has been accepted by the committee, and Mr. Hale will receive the commission.

Architectural Association.—A new spasmodic publication with the title "The Tufton Street Tatler, or the Purple Patch," is announced to appear for the first time on May 18. Its objects are to ventilate all grievances; to stimulate the bright enthusiasm of youth; to resuscitate the waning interest of middle age; and generally to render more efficient the present administration of the ancient and honourable society.

The Surveyors' Institution will hold their next country meeting at Exeter on May 25 and 26. In the afternoon of the first day various places of interest will be visited, and a party will be shown over the cathedral by Chancellor Edmonds. The second day is set apart entirely for visits and excursions, the principal of which are an excursion to Torquay and Totnes, visiting Berry Pomeroy Castle *en route*, and thence by steamer down the river Dart to Dartmouth, a visit to Plymouth and up the Hamoaze by steamer to the Devonport Dockyard extension works, the Royal Albert Bridge and the Devonport and Keyham Dockyards, and viewing the warships in the harbour.

The Berwick Town Council discussed last week a letter from the Society of Antiquaries, Newcastle, referring to suggested alterations on the Old Bridge at Berwick, and urging the Council to allow the bridge to stand as at present, and build a new structure suitable for modern requirements. It was pointed out that for two and three-quarter centuries the bridge had formed one of the most picturesque features of the town, and was a unique example of the architectural construction of its period. The Mayor remarked that if the Society of Antiquaries would help them to pay for a new bridge they might consider the matter, but he demurred to outside interference in their affairs.

The Bust of the late Robert Brough, A.R.S.A., has now been placed in the Aberdeen Art Gallery. It was formally presented to the Art Gallery committee by a joint letter from Mr. Frampton, chairman of the London committee, and Mr. Theodore Crombie, chairman of the Aberdeen committee, addressed to the chairman of the Art Gallery. It is a bronze portrait bust by Mr. Derwent Wood on a marble pedestal, the inscription on the pedestal being:—"Robert Brough, A.R.S.A. Born March 20, 1872, died January 21, 1905. Presented to the Aberdeen Art Gallery by his fellow-artists and other friends."

The Contract for the erection of Cathedral Mansions, to occupy the sites of Nos. 258-266 Vauxhall Bridge Road, Victoria, S.W., has been signed between Mr. Tod Heatly, D'Eresby House, Ltd., and Mr. C. Gray, contractor, of Kensington and Shepherd's Bush, and the work is to be commenced at once. The plans contain many novel features in the planning of flats, and there will be a roof garden for use of tenants. The elevation will be carried out in cherry-red bricks, gauged work and dressings of terra-cotta by Dennis, of Ruabon, from full-size details for modelling by the architects, Messrs. Palgrave & Co., Westminster. Mr. Farrell is the clerk of works.

The Architect.

THE WEEK.

THE establishment committee have made a recommendation to the London County Council which, if imitated generally, would obviate the annoyances to architects and clients which arise out of the question of the ownership of drawings. Colonel EDIS, F.S.A., was commissioned by the late School Board for the planning of the board-room and the eastern extension of the education offices on the Embankment. As a matter of course he retained his drawings. In connection with the drainage, foundations, &c., of the offices, it has frequently been necessary to communicate with the architects responsible for the various buildings, and the drawings in question would undoubtedly be of considerable value in the architect's department. It is therefore suggested that the Council should purchase them at the fee named by Colonel Edis, viz. 52*l.* 10*s.* This is an easier and more economical mode of settling a difficulty than by invoking the powers of the law courts. Besides, it is doubtful whether the Statute of Limitations would not be a bar to any attempt to claim a right in the drawings.

THE Court of Appeal, MATHEW, L.J., dissenting, decided in the case of *GRIFFIN v. Houlder Line* that a seaman, at work upon a ship in a dock came within the provisions of the Workmen's Compensation Act. In our note upon that case we ventured to express our approval of the dissenting judgment, pointing out that the Act was never intended to apply to seamen, and that the case of *REINE v. JOBSON*, which the majority of the Court considered decisive in favour of their view, had really no bearing upon the case. We are glad to see that the House of Lords has adopted this view, and reversed the decision of the Court of Appeal. It is clear that to apply the Act to seamen when at work upon a ship in a dock, leaving them to be governed by the special statutes applicable to them at sea, would have produced endless complications.

THE "non-provided schools" of the Metropolis which mainly consist of those connected with churches, are likely to cause a serious outlay to those having charge of them. A special survey has been made of 438 schools, and out of that number only sixty-four are found to be in a very good state of repair or requiring few repairs. About twenty-five per cent. have been found unsuitable, and it has been impossible to make suggestions for improving them so as to meet the requirements of the London County Council. According to the report, the staircases in many buildings are positively dangerous in the event of fire and panic, and are besides very inconvenient for the work of the schools; ventilation and warming are in many cases either very bad or quite inadequate for the needs of the children. Closed stoves, which easily get red-hot, are particularly numerous, and should in all cases be replaced by modern grates with brick flues. The smoke from these is usually carried off by an iron pipe, and in many instances these iron pipes are faulty. In several instances ventilation is secured only by opening both windows and doors, with resultant draughts and serious inconvenience to the scholars. In one case the boys' school is described as under the church, four steps below the street level. In another case, which is also under a church, the schoolroom is only 11 feet 4 inches high. Seventy-eight per cent. of the drains were tested and were found to be unsatisfactory. In twenty-six cases the Managers would not allow tests. If the recommendations are adopted there will be a deficiency of 68,824 school places. The work will therefore have to be undertaken without delay, or, in other words, as soon as financial arrangements can be completed.

MR. W. H. GOODYEAR, of the Brooklyn Museum, should be happy, for it has been arranged that the new cathedral at Denver, Colorado, will include in its design the refinements of the outward divergence and of the vertical curves in the piers of the nave which he has explained as characterising Gothic buildings. This will be the first building of modern times, or within the last 350 years, to exhibit this constructive refinement. The peculiar significance of this announcement lies in the fact that it carries with it the proof that the use and æsthetic beauty of this system of construction are not hidden or incomprehensible to modern taste, as has sometimes been suggested. That the modern artistic temperament can actually revive this system of construction proves that it can also be understood, not only as a matter of theoretical self-projection into the past, but as a desirable improvement in great modern churches.

FOR the first time in the history of the Académie des Beaux-Arts a lady has been allowed to take part in the competition for the Prix de Rome in the section of painting. This combatant, who deserves recognition although she may not win the victory, is Mdlle. RONDENAY, who has studied in M. HUMBERT's atelier. Her opponents are:—MM. FLOUTIER (M. CORMON), LÉTY (MM. BONNAT and HUMBERT), BOURDON (M. CORMON), RENÉ ROUSSEAU (MM. BOUGUEREAU, TOUDOUZE and FERRIER), PATISSOU (M. CORMON), JONAS (M. BONNAT), AUBRY (MM. GÉRÔME and FERRIER), GONTIER (M. JEAN-PAUL LAURENS), CONCARET (MM. BOUGUEREAU, FERRIER and LAROUZE).

THE early iron bridges must necessarily suffer under constant traffic. Exaggerated statements about the extent of the deterioration have appeared which were generally based on imagination rather than observation. Mr. W. MARRIOTT lately explained before the Institution of Civil Engineers how he had strengthened some of the early bridges. One was over the river Ouse, and consisted of three spans of 117 feet and two end spans of 70 feet. The reinforcements were extra plates to increase the flange area and provide extra rivets for the braces, new cross girders and flooring. The bridge was thus brought up to modern requirements at a cost of some 8,000*l.* Another bridge was over the river Thurne. There were three spans of 79 feet each, which necessitated extra plates at all panel-points to give extra rivet-area, new cross girders and longitudinals and rearrangement of flooring. The whole of this work was done while traffic was running, at a cost of about 2,050*l.* Mr. MARRIOTT recommended the use of Portland cement for the purpose of preserving girders from rust.

A QUARTERLY meeting of the Royal Society of Antiquaries in Ireland will be held in Dublin on Tuesday next, when papers will be read on Hall-marks of Irish Plate, Dublin Engravings, and Iniscathy. On May 30 and May 31 there will be a meeting in Kilkenny, when there will be visits to the picture gallery of the castle, which contains valuable works, St. Mary's Abbey, the Black Abbey, St. Canice's Cathedral, Thomastown Abbey, Jerpoint, and various other examples of antiquity. Arrangements are in progress for meetings and excursions from Belfast for the week extending from July 3 to July 8, the programme for which promises to be very attractive. The report of the Council says that a series of suggestions relating to ancient monuments prepared by them have been virtually accepted by the Estates Commissioners, and that body has already consulted the Council as to several ancient structures on estates being transferred through them. This has thrown a considerable amount of work and correspondence on the Council and the committee. It is often difficult to supply the required information, but if the local secretaries acquaint themselves with the particulars likely to be needed, the Society will be better enabled to fulfil a useful public function.

PROPOSED COUNTY COUNCIL HALL.

AMONG the sites which were suggested for new offices for the London County Council no architect, surveyor or amateur mentioned one adjoining Westminster Bridge. If eligibility were alone to be considered there are many places within the metropolitan area which would seem to be better adapted for the purpose. A building of the kind ought to be near other important buildings, and to be of a character which would suggest the supremacy of the government of London. The County Council appear to have adopted the site after finding that others were unobtainable. In 1893 it was proposed to purchase 98,000 square feet in Parliament Street, which could at that time be acquired for 750,000*l.* But the Council declined to approve of the special committee's recommendation. Three years afterwards a Bill was introduced for the purpose of securing a site between Spring Gardens and Trafalgar Square, which would have an area of 84,000 square feet at a cost of 813,000*l.*; but the Bill was not passed. Then in 1902 another special committee suggested the purchase of 145,926 square feet in the Adelphi, the cost being 900,000*l.* But as the Council were equally divided on the matter that project fell to the ground. The site near Westminster Bridge, which extends to the Belvedere Road, and part of which is occupied by the Works Department, is still larger, for the part to be obtained contains 248,766 square feet, and with the land already acquired would have an area of about $7\frac{1}{2}$ acres. The cost is 600,000*l.*

We need not consider whether the site is convenient. The establishment committee have investigated the subject and declare that "it is in a central position with regard to means of communication from all parts of London." There are so many changes in railways, tramways and omnibus routes that few parts of the Metropolis can be considered as isolated, and if the County Council offices were erected care would be taken to bring them into communication with the most important parts of London. In this connection it should not be forgotten that the steamboat service could easily be utilised.

The structures which are now to be found on the site are enough to convince a spectator about the unsuitability of the place for one of the most important public buildings. The neighbourhood is also of a mean kind, and for a time at least the environs of the new offices will appear still worse than they are at present from the force of contrast. But St. Thomas's Hospital, which occupies a similar position on the other side of the roadway, is an object lesson that demonstrates the improvement which can be accomplished in such a place.

It is well to remember that many years ago the erection of important buildings on the site was contemplated, in order to avoid the sordid contrast with the Houses of Parliament. Anyone who will look at the plan prepared in 1857 by Sir CHARLES BARRY will find on it "Belvedere Terrace Road upon arches," and new buildings were proposed to be erected as far as the Waterloo Road. According to Bishop BARRY, "all the eyesores on the Surrey side of the river, which marred the view from the terrace of the new palace, were to have been swept away, and the river would have flowed on through a vast Gothic quadrangle." Fashion has changed in the course of half a century, and the view will be none the worse if members have to look upon a fine Renaissance building.

The establishment committee say:—"We also think the site offers exceptional opportunities for architectural treatment. The river at this point runs nearly due north, and the site being approximately parallel with the river, three façades would be respectively on the south, east and west aspects, and the maximum of sunlight would thus obtain throughout." At one time it is well known that mansions were erected on ground close to the river, and more especially on the Middlesex side. Old views of London suggest that the buildings

which were most deserving of admiration might be found near the banks of the Thames. In our day the advantages of the position are not sufficiently appreciated. But many foreigners, and artists particularly, are more fascinated by the river than by the streets. Long before there was a Thames Embankment we find THÉOPHILE GAUTIER, when writing from London, saying:—"Forgive me if I am always talking to you about the Thames, but the moving panorama which it ceaselessly unfolds is so new to me and so grandiose that I cannot tear myself away from it." The Thames is now a cleaner river than it was then. It has been improved. There is, indeed, no reason why a Renaissance building should not be as effective on the Surrey bank as one alongside the Grand Canal at Venice.

The building must be however worthy of its position and of its purposes. The experience which is derived from the Houses of Parliament and from St. Thomas's Hospital suggests that something more is demanded in such a place than would be required in building in a street. The movement of the river and of the boats upon it does not appear to be in unison with monotony. The lesson is conveyed to us by Venice. The arcading of the Ducal Palace imposed a repetition of arches in the library, which is continued in the Piazza of St. Mark. But if Venice consisted of a series of similar repetitions, would it have the charm which it still retains for strangers? If a Renaissance building is to be erected we hope it will not be suggestive of designing as well as building with the aid of machinery. We are disposed to put a liberal interpretation upon the words of the report:—"In the middle portion of the river façade might be placed the council chamber and committee-rooms, which could be grouped as a central feature, and in this position would be subject to a minimum of the external influences of traffic and noise," and assume that there will be no rivalry in monotony with the Houses of Parliament.

A building of the kind is worthy of the best architectural skill in the country, and, indeed, only the best should be allowed to participate in its production. MARRABLE'S building in Spring Gardens was designed at a time when the Metropolitan Board of Works could be considered as being in a tentative state. Mr. THWAITES, the chairman, was rigidly economical, and had been accustomed to the circumscribed conditions of a vestry hall. The building was therefore designed in that characterless Italian which seemed to be especially adapted for emergencies. The greater part of the business since the County Council came into existence has been transacted in private houses, the superintending architect's department being located in seven. According to one statement, no less than 1,264 officers are located in outside offices. From such a state of things it is easy to draw the conclusion that a building of the barrack type would serve for the business of the Council, as the Belvedere Road would serve to contain it. Public opinion does not appear to be in favour of spending 1,056,000*l.* on a building and 441,000*l.* on an embankment in front of it. It is advantageous, however, to have a centre which would be typical of the greatness of the Metropolis, and any shortcomings which may belong to the site can be compensated for by means of architecture. It may be objected that the time is not opportune for the expenditure of so much money, but when it is remembered that the Council is at present paying 38,765*l.* 10*s.* a year for office rent, it is desirable that such an incubus should be removed.

The remarkable majority in favour of the project (83 to 21) is evidence that those who have the opportunity of judging all aspects of the subject have realised there is no more satisfactory issue out of the difficulty. It may now be assumed the site is determined, and we hope that when deciding on the character of the building an effort will be made to obtain one which will be a credit to the Metropolis and to the architectural and constructive power of our time.

BRAUWEILER ABBEY CHURCH.

By JOHN A. RANDOLPH.

AT about twelve miles to the north-west of Cologne, on slightly rising ground dominating the plain that extends from the range of hills pierced by the Horrem railway tunnel, stands the noble abbey church of Brauweiler, once attached to a Benedictine monastery (on the site of which is now a reformatory and house of correction and poor-house combined).

The lofty but otherwise comparatively small church is mainly Byzantine, with a colossal tower and spire at the west end, flanked on each side by slender square turrets reaching to the base of the spire; and the east end apse—a singularly graceful feature in this case—has a square tower at each side, while at the crossing of nave, transepts and choir a large octagonal lantern helps to give a most imposing grouping of roofs, towers and turrets. But charming as is the picture from outside, especially from the north-east corner of the courtyard on the north side of the great church, and also from the small courtyard on the south side of the nave, with the cloisters in front lining the aisle and the chapter-house that lies to the south-east—this south courtyard being entered from the main door of the Anstalt—the interior of the church is much more interesting, on account of the quaint frescoes, sculptures, double crypt entrance at the chancel entrance, and the exquisite altars; while the chapter-house, now partly used as a chapel for the non-Catholic inmates of the Anstalt, is celebrated for the frescoes covering the whole of the vaulting, each panel between the ribs bearing different subjects of Old Testament history.

The history of the abbey dates from a long way, as will be seen in the following brief survey. The origin goes back to the last quarter of the tenth century. The Pfalzgraf HERMANN, whose castle was at Brauweiler, allowed the little wooden chapel of St. Medardus, in the forest there, to be replaced by a stone structure, which was consecrated by WARINUS, Archbishop of Cologne (976-85).

EZO, HERMANN'S son and successor, who married MATILDA, daughter of OTTO II., resolved to build a religious house in Brauweiler, and in April 1024 the founding was completed by Abbot POPPO VON STOBLO, and the church was consecrated early in November 1028 by Archbishop PILGRIM.

The monastery was not on the site of the chapel, but at a few paces to the north of it—about where the women's part of the poor-house is situated. So rapidly did the abbey's reputation grow, that at the end of June 1048 it was found necessary to rebuild the monastery on a larger scale, and the first structures were demolished. Two and a half years later the crypt and three altars were blessed by ROBERT, Bishop of Münster; and ENNO, Archbishop of Cologne, assisted by ENGELBERT, Bishop of Minden, consecrated the completed new church in 1061.

From that time for the next thirty years, under the rule of the third abbot (WOLFHelm), exquisite frescoes and mosaicwork were executed in the church.

In the west tower was an altar of St. Michael, evidently a popular custom, as examples are known at Maastricht, Kiedrich and elsewhere. This altar was blessed in 1141, but was destroyed later to allow for the organ being placed there. The present organ dates from the eighteenth century.

About 1141 an enclosing wall was erected round the church, and at this period the hitherto "flat" ceiled roof of nave, aisles and choir gave way to vaulting of masonry. In the great nave several columns were placed and others were strengthened, while the main buttresses were made stronger and received the addition of colonettes on the inside of the walls. The plan was quite simple in its extension, and the "new work" only distinguishable from the old by irregularity of plan and detail.

The Abbot BERTRAM of Aurath, who died at the end of the twelfth century, proposed to extend the church, and collected money in the diocese for the purpose, but it is not known whether the amount he obtained went to the building of the tower or to what particular part of the church the sum was devoted.

Under Abbot GODESMANN during the next quarter of a century there was an enlargement of the church. After 1200 the whole of the east end was rebuilt right up to the transepts, and the choir itself extended by about 12 feet, but the crypt was not touched. To strengthen the foundations of the new chancel arch the crypt columns had to be built round. In 1200 three new altars were consecrated in the crypt. The work of extending and rebuilding stopped before the end of GODESMANN'S rule (1226), when the turret, from the old materials, on the south side of the west tower had reached the level of the parapet at the spire base, and was covered by a provisional roof. The one on the north side was not so advanced and was later cut down to half the height of the choir. The beginnings of a central lantern got no further for a while than beginnings.

The organ was transferred, under Abbot HERMANN II., from the north side of the church at the end of the fourteenth century by WYLMELMUS, Canon of Suzato.

Nothing much appears to have been done constructionally from 1200 till the sixteenth and following centuries. In the first quarter of the sixteenth the sexpartite vaulting of the nave bays was altered to a late Gothic form, the nave space being thereby curtailed by about 5 feet but raised by that amount. The interior was painted in 1556 and the frescoes of the east end obliterated. Half a century later a hurricane destroyed the west tower and seriously damaged the roof, but the steeple was restored to its original design by Abbot JOHN MÜNCH in 1629. He also began the arrangement of the south-west part of the crypt as a burial vault, thus altering and destroying much of it.

NAPOLEON, by decree, in 1802 suppressed the abbey, and the church was given to the parish in 1806, the abbey buildings turned into a poor-house in 1810 (by decree of November 16 of the previous year), and to a workhouse and reformatory in 1815. Since September 21, 1872, the buildings belong to the State in which the province lies.

A thorough restoration was initiated in 1860, with

the Kreuzgang, or cloisters, the chapter-house, and the chapel of St. Medardus. To the Cologne Cathedral architect, ZWIRNER, that portion of the work was entrusted, but the whole church was not undertaken till 1866, under WIETHASE.

CLEMEN gives an account of the condition of the church then:—"At the eastern end the shell had pressed out of plumb; the vault was torn and only held together by cramps and ties; the nave vaults had thrust the supporting walls out of line; the windows had been made bigger, without regard to their date; long tiles covered the north turret of the side, as also the sacristy; and the roofs were in bad condition and the whole building sunk about 6 feet on the north and east sides."

The restoration required the readjustment of the choir vault, the preservation of the frescoes and an underpinning of that part of the church. The nave was freshly "tied," and the foundations of the walls and columns strengthened, and doors and windows restored to their original shapes, and one of the rose windows altered on the north side in the style of the beginning of the thirteenth century, while parts of the damaged and blocked-up crypt were reopened and the ground outside cleared at that part.

On the inside the lateral towers were completed and their upper storeys finished, the lantern re-erected on its vaulting, gables and roofs rebuilt to former measurements, and a rich entrance made in one of the cloister bays on the south. Inside, the painter, MÜNSTER restored the whole of the thirteenth-century frescoes. The restoration works, as far as they then went, took ten years, and cost 150,000 marks (7,500*l.*), or, with contributions from the Provincial Board of Works and private persons, 180,000 marks (9,000*l.*), these last coming in from 1866 to 1874.

In 1885, thanks to a further grant of 10,000 marks (500*l.*) from the province, the restoration works that had been begun were completed, and in 1895 the works were superintended by HENRY RENARD, of Cologne.

The reformatory buildings are grouped round three quadrangles, the one alongside the church on the south side being the oldest, the old Romanesque cloister arcading still remaining on two of its sides. Due west thereof the main buildings of the eighteenth-century addition were erected, to the south of which are the original guests' house and the chapter-house (this latter already alluded to).

The western block, the only one visible to the passer-by, and the only one of interest, is of brick, of two floors, with middle and end pavilions and saddle-back roof with louvres, the spaces between the middle and end pavilions being lighted by seven windows and the pavilions themselves by three, and, in the case of the end ones, finished with a central window under a pediment. The main pavilion has a large entrance door with two windows on each side, and crowned with a cornice and round-headed gable termination. In the panel, or lunette, on that front are the arms of the last abbot, and under them a statue of St. BENEDICT.

On the main gable of this block there is a statue of the Madonna in a niche, on a crescent moon; and in the round-headed gable the arms of the builder and the date, 1781.

To the north of this block, abutting on the street, but standing back a little, is a galilee porch of rude style, leading to the entrance to the church under the tower.

Mr. Frank Sumner has been appointed City engineer by the Court of Common Council, vice Mr. D. J. Ross, who retires on a pension. The salary is 1,000*l.* per annum, rising to 1,500*l.* Mr. Sumner entered in 1885 the office of Mr. J. Alfred Gotch, where he remained three years. He is now in his fortieth year, and will relinquish his office of borough engineer and surveyor of Woolwich. He was placed second in the recent appointment of City surveyor. Mr. A. Collins, city engineer of Norwich, was the alternative selection.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Belcher, A.R.A., president, in the chair.

Mr. ALEXANDER GRAHAM (hon. secretary) announced the decease of the late Mr. Francis Edward Caws, of Sunderland, a past president of the Northern Architectural Association. Mr. Caws passed the Associate's examination of the Institute, and was admitted a Fellow in 1893. He was responsible for much architectural work in Sunderland and neighbourhood, and he designed and carried out the pier at Sea View, Isle of Wight, and the Suspension Bridge across the Wear at Stanhope. It was silently agreed that a letter of sympathy and condolence should be forwarded to the relatives and family of the deceased.

Mr. MERVYN MACARTNEY read a paper entitled

Garden Architecture.

He said that scarcely any subject had been so exhaustively studied of late years as that of garden architecture, and heated controversies had been waged over the rival advantages of formal and informal gardens. At present the former held the field, and he hoped that in this case fashion would prove constant. Citing some ancient instances of formal gardens, the author quoted at length the graphic description given by the younger Pliny of his villa garden, with its spaciouly well-proportioned portico, in front of which was "a sort of terrace, embellished with various figures and bounded by a box hedge, from whence you descend by an easy slope adorned with divers animals in box answering alternately to each other into a lawn overspread with the soft acanthus: this is surrounded by a walk enclosed with tonsile evergreens shaped into a variety of forms." Later, there were the formal and natural schools as represented by Lucullus and Martial, fighting the "battles of the styles" even thus early. Mr. Macartney confessed he could not see why in the construction of a garden human thought and labour should be eschewed. The most interesting examples were those on which the greatest skill had been expended. Not that the larger the amount of wall and terrace employed the better the result. It was possible to overdo these and produce failure. In the case of Versailles there was a sense of enormous effort with little result. Vast terraces, lagoons of water and huge fountains produced no satisfactory result, only a sense of futility, a useless expenditure of labour and money without adequate return. Turning to some English examples, the author said:—"Montacute, to my mind, is the most satisfactory. It fits the position, and yet, like so many other English and British examples, it owes little to site. It is comparatively flat, and there is no distant view. What charms it has are of its own making. So it is with Wilton and Melbourne, and herein lies a difference from the Italian examples. They generally owe a great deal to position, perched on a hill you have vistas of distant country framed by towering cypresses into delightful pictures. Yet in the British examples you have a distinct sentiment; it is of a garden that you love—a charm that can only be gained by the employment of rare knowledge and design. There is a subtle charm about the terrace at Haddon Hall and the bowling-green at Bramshill that is absolutely absent in Trentham or Versailles. There is no great striving after effect. I would rather be the designer of Montacute than Versailles—I will go further, and say of the Haddon Hall terrace rather than Versailles. Indeed, there are few of the vast garden conceptions that please me. Chatsworth bores me, so does the Crystal Palace; yet they are laid out on grand lines: they are meant for spectacular performances, and unless all the fountains are playing the effect is dismal as an empty theatre." The gardens placed on hills give the architect an opportunity of showing his skill in designing terraces, balustrades and steps. Some of these in the Italian gardens are wonderfully ingenious and beautiful. Water as part of the garden design was very largely taken into account by the Italians. Garden flowers were no part of the scheme, and scarcely came in at all. Architectural features and evergreen trees were the two principal factors in considering the effect to be produced. Antique fragments—such as vases, urns, capitals, altars, &c.—were largely used, some as cisterns, others as receptacles for plants, &c. These were useful to lighten up the sombre depths of the ilex groves, and were suitable in that climate, but here they look cold and unhappy. Mr. Macartney exhibited lantern views of various notable examples of Italian gardens to show what masters in their art and craft their designers were. Remarking on the essential difference

between English and French, Italian and Spanish gardens, the author referred to the beauty of the English lawns. Abroad they could only be obtained by great care and attention, and are a source of trouble and difficulty. Shade, too, in those countries was of vital necessity. Here it rarely was the case, and many of the pergolas that people were so enamoured of were nasty damp places totally unfitted for the climate. A third point was the effect of strong sunlight and heat. A marble seat here was a very uncomfortable place to sit on. It was generally damp and cold and therefore unsuited to our climate. The paper next dealt in considerable detail with home gardens, showing examples of different ways of treating some of the many factors that make up the sum of an architectural composition—such as terraces, steps, &c. As regards the width of terraces, there is more chance of failure by putting a narrow terrace than a broad one. Generally speaking, the width is largely governed by the amount of surplus earth excavated from the foundations. If the site is a very steep one the terraces are usually narrow. Balustrades admit of much play of fancy. The turned baluster is very commonly used, and the author favoured the widely-spaced English work. Quaint terminals on the piers, and also pavilions at intervals and at the corners, are introduced to vary the monotony of lengthy balustrades. Montacute is a case in point; the play of fancy in this design is very happy. Other architectural details referred to and illustrated were gate piers, fountains, ponds, sun-dials, pavements. Summing up his own views on the subject, the author said that if he were called on to lay out an extensive garden site in England he should avoid geometrical beds—those unhappy compositions with shapes like tadpoles, kidneys, &c. Neither should he embark on topiary work on any great scale. Hedges of yew, privet, hornbeam, &c., were charming adjuncts to a garden, and here and there trimmed shrubs were useful; but he could not admire Levens, Elvaston or Blickling. As our country is the most beautiful in the world, he would take advantage of every opportunity that offered of incorporating it into his scheme. Supposing he had not merely the laying out of a site of a garden, but also the choice of its position, he should not choose a lofty hill with a panoramic view. From the result of his experience he was certain that this was a mistake; foreground and middle distance was wanted—human interest. Avenues of trees bordering a long stretch of water, as seen at Fontainebleau and Hampton Court, pleased him more than the terraces and beds of Versailles. One could not disserve oneself from one's climate, and though he vastly admired the superb cypress, ilex and arbutus groves of Italy, he was as fond of our deciduous trees, even in winter. He did not care very much for the appearance of evergreens in England, except the yew and holly; their foliage had a hard metallic look that seemed to indicate that they were not happy in their surroundings. To his mind the detail, invented and perfected in this country, of terrace walks, balustrades, &c., was preferable to that of any other country. Further, he would avoid marble, as looking too white and staring. A very fair surface can be got in cement (concrete) provided too much sand and water is not used, and that it is not rammed down too well; otherwise, the sand and cement will come to the surface and show the lines of the plank crutting. Dwarf walls of brick laid dry assume an appearance of age very rapidly. The author's conclusion was that we have nothing to learn now from foreign examples, that we have enough in this country to guide us, and that the best are those which are not slavish copies of other lands.

Mr. R. MAWSON, in proposing a vote of thanks to the author of the paper, said he was in the dilemma of believing that the proposer of a resolution of the kind he had undertaken was supposed to give not only praise, but a certain amount of blame, or at least criticism on the points in the paper. But he agreed with all that Mr. Macartney had said. One of the objects of the papers read before the Institute was that a discussion might follow, so that the meeting would benefit by hearing different opinions. The subject that evening had, however, been so well threshed out by the author of the paper that there were really no questions to be asked or answered. There was one thing, in passing, he desired to draw attention to. He had noticed that whenever the works of George Devey were brought to notice, his name was left out. When the views of Penshurst were shown on the screen, the name of the designer was not mentioned with them. The speaker remarked that in designing a garden they must try and consider the matter from the centre rather than from the circumference.

They would find that the centre rested in the client, and they must therefore study him, so that the house and landscape being considered together, they could say that the one was suitably received into the other. He was afraid that in considering the garden rather from the point of detail than from the design in mass, they ran some risk of losing what ought to be the chief characteristic of garden making. They must consider the garden in its larger aspects, and having made the general design finish up in the details. The opportunity that the site offered was the first point to be considered. The poet Wordsworth, in his schemes for garden making, always tried to weld the rugged, the wild and the house garden into one. By regarding garden designing in that respect they would bring the picturesque into their schemes and success to their work.

Lieut.-Col. PRENDERGAST seconded the vote of thanks, and said as one of the outside public it was not without reason that he should say a few words. He was glad the subject had been brought to the notice of the Institute, because he was old enough to recollect that it was once considered that when the last slate was put upon the roof of a house the architect's business was ended. Times had changed, and he rejoiced that nowadays they were asked to design a great deal more than the house. Garden-making was ruled largely by pounds, shillings and pence, but he ventured to think that the paper they had heard would be of great importance to the profession if the times improved. He was sorry to differ with the lecturer, for he could not agree with the insular interpretation he had given to his paper. Foreign countries had their beautiful examples of gardening, but it was wrong to hold that schemes unsuitable to the English climate were not correct in other lands.

Mr. F. R. FARROW said the garden was a place in which to grow things, and he thought that their work as architects ought to be confined simply to the provision of a frame in which things might grow. If they remembered that was the issue they would abstain from much of that formal cutting of hedges and the distortion of nature into geometrical forms which was one of the points Mr. Macartney had made in his paper. As architects he believed their work in garden making was well done when they had laid down the general lines of the mass, and then gave the gardener a free hand in the choice and selection of plants in order to produce a succession of colours, so that the garden might have constant variety in the beauties of nature. That was the beginning and the ending of the architect's connection with the garden. All he had to provide was the frame and such adjuncts as might be necessary to complete it. In an English garden they must have opportunities for shade occasionally, and for shelter, and this gave architects the excuse of pushing in summer-houses and arbours as part of the scheme and framing to a garden. He was fully in accord with the remarks in the paper concerning the introduction of sculpture in an English garden. Sculpture to be effective in such positions must be in nude figures, and representations of that kind executed in white marble against a background of dark green produced a most depressing effect. Sculpture should be avoided in the laying out of gardens unless their clients were prepared to have loggias and museums.

The PRESIDENT said that with respect to gardens generally, it was the architect's opportunity for linking his work with nature. The rigid geometrical lines of the architecture would come rather suddenly upon nature left to itself. Garden designing was therefore like the pushing out of tendrils to link the whole scheme to the soil, softening the harsh lines between man's work and nature. Mr. Macartney had drawn their attention to the rule that architectural details in relation to garden designing should not be too refined, and that was undoubtedly true because, as the paper had said, small detail was not in scale with nature. The size of the garden, too, was a question of proportion with the mansion or house which belonged to it, and therefore the garden should not extend to too great a distance. The screening of certain parts of the garden should enter into their design. This last generally raised a difficulty with clients, who desired to see in one glance the beauty of the whole scene.

Mr. MACARTNEY, in reply, said that with regard to the mentioning of names, he happened to know Penshurst very well, and he believed he was right when he said that Lord De Lisle had more to do with the design of the garden than Mr. Devey. And he ventured to think that though Mr. Devey influenced Lord De Lisle, the latter had influenced Mr. Devey. Lord De Lisle had in answer to Mr. Blomfield

claimed the design as his own. The speaker thought Colonel Prendergast had misunderstood that portion of the paper which dealt with the laying out of gardens. He agreed with Colonel Prendergast that the scheme should be geometrical, but he did not hold with carpet gardening. There should be mystery in a garden, vistas, and as much as possible arrangement in accord with the surrounding country.

ARCHITECTS' GRIEVANCES.

THE following address was delivered by Mr. Charles Cole at the annual meeting of the Devon and Exeter Architectural Society:—In accordance with custom, I have now to deliver the usual valedictory address; but in the first place, allow me to thank the members of the Society and our honorary officers for the uniform kindness which has been extended to me at all times. If the year's work of the Society has not been startling, it has at all events been sound and useful. Although we have not had a great number of papers, we have had some very practical and interesting discussions on various matters, many being quite informal.

You will remember possibly that your Council, so far back as September last, endeavoured to ascertain if something could not be done in the matter of providing the younger members of the profession with a definite scheme for their better education in professional knowledge and practical work on well arranged lines as distinct from the ordinary routine of the drawing office; and negotiations were opened with the Architectural Association with a view of obtaining the services of gentlemen willing to give lectures in various places in the provinces. I am sorry to say there was so much apathy that it was felt impossible to proceed; the expenses would have been, comparatively speaking, very great, and the Council reluctantly dropped the scheme.

Your Council also appointed a sub-committee to deal with the question of by-laws, more particularly as regards Exeter, whose City Council intend to redraw and remodel those now in existence. The town clerk has kindly expressed his willingness to allow us to lay our views before him. On the general question of by-laws so much has been written and said lately that one hardly knows whether to let this burning question go on burning or add more fuel to the flames. Of course, there must be by-laws—that everyone admits, but the model by-laws one would fancy were drafted by men who had never done any practical work at all, and as all local authorities copy them to a great extent, we get some very curious anomalies. They must not introduce any clauses suitable to their locality or make any of them at all elastic, or the Board above will refuse to sanction them. So we get this strange state of affairs. A little one-house town in the wilds of Nowhere has the same by-laws as a large city, which is preposterous. The effect of some by-laws is that in large towns many old buildings are not pulled down and rebuilt, because in addition to light troubles and party-wall questions (which bulk largely), the unfortunate architect has still to deal with the local authority, whose views are often—well, I will say, "quaint." If there were any elasticity many a client would rebuild entirely instead of "tinkering" by taking out a floor, putting up a new front and so on, often involving a great deal of trouble and anxiety and a liberal use of steel or ironwork. Even if a new building did not quite comply with all the cast-iron rules of the powers that be, it must be a great sanitary advance on old timber buildings, crusted with age and other things in its numerous cavities and worm-eaten woodwork. Perhaps one of the most irritating features of the whole thing is that where a local authority is willing and anxious to frame sensible by-laws to suit its locality, the Local Government Board will have none of them. The question now is interesting the man in the street. He begins to see now why all the houses are built alike in a new street; why there are no wooden bays or good half-timber work. I am glad to say that progressive Exeter does allow the two latter, and has also approved of bay windows projecting over our streets, so that architects get some chance of breaking up a front. Would that it was possible to renovate, remodel or rebuild the Local Government Board.

The matter of registration is still on the knees of the gods, but it really seems to be progressing at last. On March 24 two papers were read before this Society by Messrs. Cross and Hubbard on "Registration," but I very much prefer the titles they gave their subjects, viz. "The

Statutory Qualification of Architects," for, after all, what really mean by registration is education. I wish I could have had those papers before me when drafting these few notes; but perhaps, for your sakes, it is as well not, as you should probably have detained you for another hour, as you will have them in the "Journal of Proceedings."

The Royal Institute has at last drafted a Bill, although it is erroneously given the title of Act; nevertheless, it is gratifying to a great number of provincial architects to know that the premier body has at last come to the conclusion something must be done, and has actually done something, and here let me say that the Society of Architects has justified its existence. It has been most loyal throughout the eight or twenty years of its existence, and is and was ever ready to support the Institute and allow it to take the lead. I do not want to labour the point unduly, but credit must be given where credit is due. It is evident that some of our leading architects do not quite appreciate the position of affairs in the provinces, and the longer things remain as they are, the worse it will be. It seems to me to be obvious that we must all get under one umbrella. Old-fashioned notions die hard. The passing of the Medical Act showed that, now nearly every profession has its central and examining authority, from the lawyers, doctors and accountants to the midwives; only architects remain unpractical and dilatory. Just one example. What happened to the memorials issued by the R.I.B.A. and the Society of Architects, and forwarded to nearly all local authorities? They were treated generally with silent respect, and allowed to lie on the table. No one took the trouble to read them. Where they are now, goodness alone knows. When we are all united we can speak with a louder voice, which will carry more weight. With a proper legal status, when we are more united, I do not think the Courts would ride roughshod over us, as they often do now. Take the ownership of drawings question; "it is only an architectural matter," and the greatest injustice is done. The drawings are only the means to an end, and yet, forsooth, a cantankerous client, even if he cannot understand which is the right side up of a plan, may insist on having the drawings handed over to him. They are of little service, and nowadays not even drain plans are as necessary as they used to be, because the manhole covers and gullies show exactly where the pipes are; and now I note that the Master of Rolls has lately dismissed Mr. Gibson's appeal against the decision of Mr. Justice Ridley that he must give up his plans, he had prepared for certain flats. Plans of buildings erected during the course of his career, together with brains and experience, are the architect's stock-in-trade, but unless he goes to the trouble and expense of making tracings all his records may be swept away. I have pointed out to clients before now that if the drawings are taken away they will assuredly be lost. Time has already, more than two occasions, proved the correctness of my statement, and the strayed ones have been restored to their fold. I must say that I think the R.I.B.A., with its splendid income, and if I am correctly informed substantial reserve, should help the profession, or at least their members, to fight with all its strength such legal injustices and unfairness.

I feel sure that the new lady architect, who is the A.R.I.B.A., would, if placed on the Council, wake up the slumberers, and help the new and younger blood on the reformed body to greater efforts and a real progressive policy—not too progressive, but just progressive enough.

The architect has to face competitors on every hand. The enterprising builder keeps the tracings of various works of which he may become possessed. Even if the architect is sharp enough and insists on their being returned before the issue of the final certificate, an office boy does the needful with pen, ink and tracing paper, and many a clever design is repeated *ad nauseam* in a row of jerry-built houses or put in a more pretentious building in entirely the wrong position. The auctioneer and house agent have a little free day occasionally, as well as—speak very lowly and with due respect—the solicitor's clerk. The engineer too builds a steel bridge and loads the spandrels with tons of cast-iron "ornament," bolted on securely to prevent the structure from rising on its pin joints or hinges and shaking off its architectural adornments into the river below. Its balustrade panels are Gothic, so are the bases of its electric-light standards, all fearfully and wonderfully designed and made. There are beautiful castings further up the steel posts, but these are not Gothic, and the lamps look down bashfully and admiringly on the bases and wish that they had crochets for their shades.

Gentlemen, generally speaking the past year has been one of bad trade, and naturally people do not proceed with new works under such circumstances. Let us hope that shortly matters may improve and find work for a very deserving class, and that those who promote competitions may so draft the conditions that architects may feel that they will be treated fairly. The public and committees generally have only very crude ideas of the enormous amount of work involved in preparing the necessary drawings, and I think that the suggestion of the R.I.B.A. is most excellent, that promoters should pay a successful competitor 1½ per cent. on the estimated cost of a delayed abandoned scheme; but one may call "spirits from the sty deep." The question is, will they come?

I do not propose to give the ordinary schedule of works carried out either locally or throughout the country. You will all read that for yourselves; but I really believe the public generally are taking more interest in architects and their works, and one hears less and less every year of the coarse remark or jest that "they keep the cost of the work so because they are paid a commission on it." When registration is *un fait accompli* it will die out altogether. We must all endeavour to see that the younger men who come in have a real love for a beautiful art and science, and be determined to be a credit to it by being well informed of all its various ramifications, because, after all, even with registration—let me misquote—"the name is but the guinea stamp, the man's the gowd for a' that."

Gentlemen, I am afraid that mine has been a most unsatisfactory address—nothing new; words, simply words. I have studiously avoided talking to you about art with a capital A. Only a master could do that satisfactorily, with credit to himself and satisfaction to his hearers; and opinions differ so considerably.

AMERICAN DRAWINGS.

At the International Congress on Art Teaching recently held in Berne, nothing attracted greater attention, says the *Scotsman*, than the specimens of art work executed by pupils of American schools. From an educational point of view they were probably the most notable feature of the very interesting selection of examples brought together from various countries. For some weeks past they have been on exhibition in Paris. At the request of the Scottish Education Department they have now been sent across to this country, and they have just been arranged and placed on view in the School Gallery of the Royal Scottish Museum.

The collection consists of a large number of drawings, which, as they are hung, occupy about 240 feet of the museum wall space. The greater number of them illustrate the various grades and stages of the work done by the pupils in the public schools of Springfield, Massachusetts, under the direction of Mr. F. H. Daniels. With these are associated a group of drawings by the pupils of the Training School at Hyannis, accompanied by a collection of objects in basket-work and by photographs of the school building and its internal arrangements. The pupils of the Pratt Institute at Brooklyn have furnished a series of decorative compositions, while the private school carried on by Miss Wheeler, of Providence, U.S.A., a well-known enthusiast, is also extensively represented.

The whole exhibit was brought over from America by the delegates who came from the United States to the Congress. With characteristic generosity the majority of the specimens were presented by their owners to the Swiss Pedagogic Museum in Fribourg. The commission of that museum, much impressed by their value as object-lessons, placed them at the disposal of the International Federation of Art Teaching in order that they might be circulated for exhibition in different European centres. Paris was their first resting-place, and from Paris they have come direct to Edinburgh.

Apart from the interest which attaches to these specimens in themselves, the whole movement with which they are connected is one of very great importance for art teaching generally. The Berne Congress was the second of what is hoped may be a long series. The first was held at Paris in 1900, on the occasion of the Great Exposition, the idea having originally been mooted by the Paris Association of Teachers of Drawing. This latter meeting, which took place in the end of August 1900, was not very representative, three-fourths of those who attended being French. At the same time it was really a success. Many important questions were discussed, and the exhibition of

drawings connected with it was of great practical service, bringing out, as nothing else could have done, the distinctive characteristics of work executed in schools of widely varying types and of different nationalities, and so giving an excellent opportunity for comparison of methods and results. It was wisely resolved to make no attempt at an annual gathering, it being felt that one meeting in four years would probably suffice for a fruitful interchange of ideas, without entailing any undue effort to secure a large attendance. The second meeting was organised under the direct charge of a committee selected by the art masters of Switzerland, and those who had the good fortune to attend the congress of 1904 can testify to the great success of the arrangements carried out by this committee under the direction of its genial chairman, M. Leon Genoud.

The Berne Congress, as might have been expected from the circumstances, was of a much more obviously international character. There were delegates present from all the nations of Europe—France, Russia and Switzerland being most largely in evidence. A considerable contingent came from the United States, while Japan, Mexico and the Argentine Republic also contributed their quota. There was a fairly large party from England. Scotland, however, had very few representatives, and Ireland had none. The countenance given to the proceedings by the Federal Government was testified to by the fact that the opening and closing ceremonies were held in the National Council Chamber of the Swiss Houses of Parliament, and were presided over by the President of the Republic in person. For hospitality during the ordinary sittings the Congress was indebted to the University of Berne, in the handsome and commodious buildings of which its meetings were held. French, German and English were recognised as official languages. A delegate might make his remarks in any one of the three. If his speech was important it was usually followed by a brief summary in the other two. This plan was found exceedingly successful in maintaining the interest of the different nationalities in the whole proceedings.

As has already been indicated, the collection of exhibits now so worthily represented in the museum was an important adjunct of the Congress. It is all the more to be regretted that the display from England was meagre, while Scotland and Ireland sent absolutely nothing. Our Scottish schools have already proved themselves well able to supply worthy specimens of similar work to various centres both in England and America. That they sent nothing to Berne is probably to be accounted for by the fact that through a misunderstanding the request for contributions from Britain was addressed to the English Board of Education, no official application being made to Scotland at all. As London is to be the centre of the third International Congress, it may be taken for granted that Scottish teachers will see to it that they are fully represented there in 1908, both personally as members and by an adequate display of characteristic work from their schools.

An examination of the drawings in the museum suggests that natural objects, or rather the study of the forms and colours of natural objects, is now regarded by American teachers as providing the best basis for a course of instruction in elementary drawing. The widespread recognition extended to this view was emphasised by much of the continental work that was shown, particularly that from schools at Kladno and Dresden, and also by the speeches of many individual members of the Congress. It is worthy of note that in all the best of Scottish schools the fundamental principle of which such teaching is the expression is almost universally accepted nowadays. In short, the whole trend of enlightened opinion is in favour of always giving pupils actual objects to study and represent, and never diagrams to copy. This is, of course, no "new-fangled fad" of the moment. It is the policy that was so eloquently pleaded for by Rousseau in the eighteenth century, and again by Herbert Spencer in the nineteenth.

The collection is to remain in Edinburgh for about three weeks, and it is to be hoped that not only those directly concerned with the teaching of drawing, but all who are interested in educational questions generally, will take advantage of this quite exceptional opportunity of seeing for themselves how drawing and manual arts are being taught on the other side of the Atlantic, and how these branches are being brought into connection with different subjects of the school curriculum.

The Portrait of the Duchess of Sutherland, by Mr. Sargent, R.A., is among the works in the exhibition of the National Society of Fine Arts in Paris.

NOTES AND COMMENTS.

THERE is at the present time much discussion in Paris respecting the fortifications. Since the last war their existence was doomed. The Government have agreed to the demolition and the Municipal Council have arranged the price to be paid for the ground. The difficulty now is to determine what is to be done with so large a zone. At first the Municipal Council contemplated disposing of the ground as building sites. But in Paris, as in London, there is a desire to preserve open spaces; and it is considered that if there could be a series of gardens the city would become far more beautiful than it is at present. Some believe that the ground could be assigned to philanthropic societies in order that houses for the working classes could be erected at a modest price. So many projects have been brought forward that the Municipal Council have been puzzled to decide between them, for the adoption of any one of them would add to the taxation of Paris, as in each case it is expected the ground will be assigned gratuitously or at a price far below that paid to the Government.

A CASE has been decided in the Carnarvon County Court which must affect a great many quarrymen in North Wales. The claimant's eye was injured while he was engaged in driving a level. It is common in those cases for the men to make "bargains," which are contracts on a small scale. The question then to be decided was whether the claimant was a contractor, in which case he would be outside the Workmen's Compensation Act. The consulting engineer to the slate quarry company said the contract in question went beyond the ordinary bargain, and that the applicant was not controlled by the manager in the same way as ordinary quarrymen. The Judge came to the conclusion that the man was a contractor and that he would be liable to be sued for any breach of the conditions. This case is remarkable, for it is believed that compensation has been obtained by quarrymen who held a similar position.

THE Eighth Arrondissement is one of the most important in Paris, for it includes the expensive streets in the neighbourhood of the Champs-Élysées. But by a contrast which is almost inexplicable the *mairie* is about the most insignificant of the whole city. Efforts have been made from time to time to secure a suitable building, one of the latest propositions being the purchase of the Hôtel Pavia in the Champs-Élysées. Arrangements may be said to be completed for overcoming the difficulty. The barracks in the Rue Penthievre—so called after a son of LOUIS PHILIPPE—are to be made over to the Municipality in order to provide a site. Between the barracks and the Rue la Boétie another piece of ground will be acquired, and in that way there will be a space for a fine building. The principal façade will face the latter street, which leads to the fashionable church of St. Philippe du Roule. It is strange the district should be neglected, but the explanation is that the inhabitants did not take steps to be strongly represented on the Municipal Council.

If there is any use in art besides affording means for trafficking in auction-rooms, it must be exemplified in the Whitechapel Art Gallery. The four exhibitions in it during last year were visited by 340,000 people, making the total since 1901 amount to a million and a half. We must suppose that at least a portion of them were in some degree improved by seeing the pictures and other works. There can be no doubt they received pleasure for a short time, and that is worth much. The outlay is not excessive; the cost of exhibitions, salaries, lighting, repairs, insurance, amounted during the year to 1,814*l.* The receipts were 218*l.* less, but by the generosity of the trustees the account was

settled. The trustees ask the public for general support to enable them to do their work, this year. There will be at Easter an exhibition of "British of Fifty Years Ago," but subsequent exhibitions depend on the subscriptions they receive. Mr. AITKEN, director, and Mr. Ross, the secretary, have devoted service for very small salaries. The trustees have promised Mr. AITKEN an increase as soon as it is permitted, and the chairman, by means of an anonymous donation for this purpose, had the pleasure of giving him last year the equivalent of such increase.

THE first stage has been passed of the competition for the working-class houses which are to be erected in the Saint-Antoine quarter of Paris by the Rothschild family. There were 127 sets of designs submitted with mottoes or other device. The jury have selected two hundred and five, and the authors will take part in the second competition. The designs were numbered, and the lucky ones which were fortunate were Nos. 10, 17, 23, 28, 30, 45, 59, 68, 72, 74, 75, 84, 88, 90, 95, 97, 98, 100, 105, 113, 114, 119, 120. It is often found in lotteries that the highest numbers gain prizes, and the same chance is exemplified in the ROTHSCHILD competition. The last twenty-five numbers yielded seven competitors or nearly a third of the whole. Some mottoes were appropriate, as "Où le soleil ne pénètre le mécontent," "La plus douce chaleur est celle du foyer."

ACCORDING to the British Consul there has been a great demand for Venetian mosaics for interior and external mural decorations in Europe and America. The new system of exporting ready-made mosaics has given a great development to this branch of trade. A cartoon to be copied is exhibited before the artist at the spot, who fixes the tesserae on that section of the cartoon assigned to them with common paste; and when each workman has executed his work the mosaic is taken together and again divided into sections, each section being numbered and carefully packed. The key is forwarded to the consignee who will enable him to have all the sections pressed in the cement and laid on the wall, and when the cement has properly hardened, the paper on which the tesserae have been pasted is removed and a perfect mosaic is seen. The Consul says he hears that mosaic art is carried on in the United Kingdom, and that orders for the pieces of enamel or tesserae, to be made according to the instructions of the firms in the United Kingdom, are sent to Venice. Purchasers of such enamels must be careful in entrusting their orders to reliable firms, and not look to cheap prices, which in the end would prove dearer to them. As the enamel pieces are sold by weight, when they are composed of coarser and heavier materials a smaller number of pieces per unit of area and a consequent smaller surface can be covered. Besides, the quality of the colours used in the composition of the enamels has also a great influence on the beauty and durability of the mosaics.

PORTLAND CEMENT.*

THE raw materials required for the manufacture of Portland cement consist of limestone in its various forms, such as chalk, crystalline limestone, blue lias rock, sea shells, &c., and silicate of alumina in the form of clay, shale or marl, varying in composition according to the locality in which it is found. Portland cement consists of a mixture of such raw materials in proper and definite proportions calcined at a high temperature, causing a chemical combination between the calcium oxide of the limestone and the silicate and alumina of the clays, resulting in a semi-vitrified basic compound in the form of a clinker, consisting chiefly of tri-calcic silicate and di-calcic aluminate.

The cradle of the cement industry is in the Thames and Medway, and the materials which were first used for the manufacture of cement, and which are now used in a much larger degree than any other materials, consist of the chalk obtained from the Kent hills on the banks of Thames and Medway, the alluvial clays found on the marshes adjoining these rivers and the gault clay which crops out on the surface in the upper reaches of the Medway. By far the greater quantity of cement manufactured in this country is made from these materials, and there is no doubt that they are more suitable for the manufacture of the finest quality of cement than any other materials in the United Kingdom. The industry has been in existence some seventy or eighty years; enormous quantities of cement have been manufactured, and the chalk contiguous to the river has been drawn upon to such an extent that it has become necessary to go further afield to obtain the requisite supplies.

The greater amount of clay is obtained, as already stated, from the saltings or marshes on the banks of the Medway and Thames. It is got out chiefly by hand-digging and in some cases by steam diggers, transferred to lighters or barges and conveyed by these means to the various points of consumption. In some cases where the cement works are so situated that the chalk and clay are found immediately adjacent the clay is obtained by steam diggers and conveyed at once to the mixing mills.

In the inland districts, where the material for manufacture consists of blue lias limestone or a hard crystalline stone, some difficulty is experienced in removing the material which is found inter-stratified between the layers of limestone, necessitating the removal of large quantities of waste material, adding greatly to the manufacturing cost. When such materials are used the limestone found in these quarries varies very considerably in composition, and more or less silicate of alumina in the form of clay has to be added to obtain the requisite proportion for the manufacture of a well-balanced Portland cement; in others, such as the Cambridge district, the materials consist of chalky marl, containing varying proportions of carbonate of lime, and so graded that the mixture produces a raw material of the requisite proportions. In other districts we have the pure crystalline limestone in near proximity to shale or clayey slate. With these materials some different process has to be adopted, they being first dried and mixed together in definite proportions. Under no circumstances, however, owing to the varying composition of the materials found in various parts of the country, are these so suitable as the pure chalk and the alluvial clay of constant composition which is found in abundance on the Thames and Medway.

My remarks this evening will apply more particularly to cement manufactured with chalk and clay by the processes already described. These are brought to the works and there carefully mixed by means of powerful machinery in fixed and definite proportions, in accordance with the requirements of the specification under which it is intended the cement manufactured therefrom is to be supplied.

The object of this preliminary process is to bring the chalk and clay into an intimate state of mixture, reducing the whole to the finest possible state of subdivision. This is obtained in different ways at various works, but the most suitable method is found by experience to be that in which washmills in series are utilised. This machinery consists of a battery of powerful mills into which the chalk and clay is panned in definite proportions, as ordered by the chemist who is in charge of this portion of the manufacture. A definite quantity of water is added at this stage to assist

the breaking up of the chalk, and the more perfect incorporation of the two materials. The quantity of water found to be most suitable is such that, together with the water found naturally in the raw materials, the resulting mixture, technically known as "slurry," contains from 40 to 45 per cent. The mixture in definite proportions is kept in motion by the rotation of the various mills of the series, to which are attached powerful harrows and other crushing implements, which reduce the larger pieces of chalk in conjunction with the clay to a fine slurry, which is kept in the mills for such a period of time, and eventually ejected through fine screens, reduced to such a state that 95 to 98 per cent. of the material is capable of passing through a sieve having 32,400 holes to the square inch. When you see the size of the chalk that is being conveyed into the mills and the large quantities of clay which are being put in at one operation you will realise what a large amount of work is done by this class of machinery, some of the batteries of washmills at the Associated Company's works having a capacity to reduce the raw materials from their natural condition to this extreme state of fineness at the rate of 50 tons per hour. The process is an absolutely continuous one, the chalk and clay being fed in in the requisite proportion at one end of the battery and the finished slurry passing away at the other or extreme end of the same battery of mills. A very careful watch is kept on this operation by the staff of chemists engaged at the various works, as any serious mistake at this point in the relative proportions of the two materials would be somewhat difficult to rectify. By modern methods, ample provision is made for the slight variation which must necessarily exist when dealing with such large quantities of raw materials. This variation is kept to the lowest possible limit, and is such that until quite recently no provision was made for further mixing in bulk after the material had left the washmills. In recent years great care has been given to this point of the manufacture, and an apparatus patented by the Associated Cement Company has now been largely brought into use at most of their works for the mixing in bulk of large quantities of prepared raw materials. The apparatus or plant consists of large circular tanks 66 feet in diameter and 12 feet deep, into which the whole of the product from the washmills of a works is pumped. These revolving mixers keep the raw materials in a constant state of motion, and provide such a perfect means of mixing that when the slurry leaves these tanks for the purpose of calcination the variation in the percentage of carbonate of lime present is found within the limits of $\frac{1}{2}$ to $\frac{3}{4}$ per cent.

The methods for determining the amount of carbonate of lime in the mixture are of such a nature that the determination can be carried out in from fifteen to twenty minutes with absolute correctness, and the greatest care is taken in a properly managed works that no slurry is delivered to the kilns for calcination until the composition has been certified as correct by the responsible chemists. When one compares the very great care and attention which is given to this department at well-arranged cement works with the old rule-of-thumb methods which were formerly and until quite recently, and at the moment in some cases, in vogue, one is not surprised that a much more perfect cement is now manufactured than was formerly the case. In years past, when the old system of pumping the chalk and clay from washmills into backs or direct on to the kiln floors, was the custom, little or no regard was given to the fineness to which the raw materials were reduced, and I have myself seen pieces of chalk the size of small peas in the slurry being delivered to the kilns.

When the raw materials are prepared by the more modern process and reduced to such fineness that 95 to 98 per cent. of it will pass through a sieve having 32,400 holes to the square inch, one realises how much better their chemical combination must be when brought to a calcining temperature than was formerly the case, with the result that at most works a very sound and stable cement is now being manufactured, which it is quite unnecessary to treat by the old methods introduced by engineers for counteracting the evil effects of over-lined or badly-burnt cement.

The process so far described refers exclusively to that known as the "wet," by which process in the United Kingdom the bulk of cement is manufactured. In some localities, however, the raw materials, consisting of a crystalline limestone more or less pure and a shale clay, or marl, are more conveniently amalgamated by what is known as the "dry" process. In this the materials, as obtained from their original source, are dried by some mechanical

* A paper read before the Society of Architects on April 13 by Mr. H. K. G. Bamber, managing director of the Associated Portland Cement Manufacturers, Ltd.

or other means, and are then mixed together in the dry condition and reduced to the state, with some form of grinding machine, of a fine powder, by which an intimate mixture is obtained. The same care and attention chemically are required in this as in the wet process, more especially as it does not lend itself so satisfactorily as the wet for mixing the prepared raw materials in bulk. It has advantages, however, in other directions in the economy of fuel, sufficient only being required to expel the moisture naturally present in the raw materials; whereas, in the wet process, that added for the purpose of intimately mixing the raw materials in a state of suspension has to be eliminated by means of decantation, as in the old "back" process, or by evaporation.

We now come to the second part of the process, which is entirely of a chemical character, that preceding it, and which I have just described, being purely mechanical. More attention perhaps has been given to improvement of this part of the process than to any other. Many forms of kilns have been tried, but the most recent development, and one which seems likely to entirely revolutionise the cement industry, is that of the rotary kiln.

The most familiar form of kiln, however, on the older method adapted to the wet process is known as the chamber kiln, consisting of a chamber having a considerable area constituting the drying floor for the wet raw materials, the hot gases from the burning charge passing over and under a further supply of wet raw materials, expelling the moisture therein and leaving it in a dry condition fit for the next charge of kiln. With all these kilns the operator has little or no control of the temperature at the part of the kiln where calcination is going on, and burnt as it must necessarily be in fairly large pieces, so that the draught of the kiln is not impaired, a considerable portion of the product gets over-burnt on the surface, leaving frequently a core of half-burnt which is difficult to remove, and which has a tendency to cause unsoundness in the finished cement.

The rotary process of burning is a development of an idea patented by Mr. Frederick Ransome as far back as 1885. It was first tried at two of the works now the property of the Associated Portland Cement Manufacturers. The machinery then employed is now in existence, and seeing the immense development which has taken place in this process of calcination, together with the revolution which is bound to be produced in the manufacture of cement by its means in this country, these early machines disclosing the first ideas of this process are worthy of a place of honour such as has been given to the earlier locomotives, which resulted in a development of trade the value of which to this country is incalculable. The ideas originated in the early Ransome process, which, for various difficulties that at the time seemed insurmountable were proved to be a failure, were, however, taken up and developed in the United States, where the use of petroleum as fuel removed a great many of the early difficulties experienced in the experiments in England. The process was eventually brought to perfection by Messrs. Hurry and Seamen, whose patents for Great Britain were recently purchased by the Associated Cement Company. So great has been the development of this process in America that the enormous product of that country is now being almost entirely manufactured by the rotary process. By this process the prepared slurry, instead of being dried on ovens or chamber-kiln floors with heat from intermittent kilns, from which ovens or floors it had eventually to be removed when dry and packed with fuel into these kilns at great expense for labour, is pumped from the mixer already described in a thoroughly homogeneous condition into the rotary kiln, down which it passes as the kiln rotates, the excess of water being driven therefrom by the heat from the escaping gases from the lower or calcining end of the kiln, where a temperature of close upon 3,000 degs. Fahr. is continually maintained.

As stated earlier, the semi-vitrified clinker obtained by this method of calcination consists chiefly of tri-calcic silicate and di-calcic aluminate. The proportion of lime to silica and alumina should not be greater for a sound cement than the ratio represented by the equation

$$\frac{\text{Ca O}}{\text{SiO}_2 + \text{Al}_2\text{O}_3} = 2.75$$
, which is based on chemical equivalents and not on percentages.

This brings us to the end of the second process in the manufacture, the third and final process, like the first, being entirely of a mechanical nature. The clinker as produced by calcination in small pieces is an absolutely inert material,

and no chemical combination with water can take place until the clinker has been reduced to a state of fine powder. This is a very important feature in the manufacture, as it is well known that the chemical action and binding quality of the cement when subsequently gauged with water are in direct proportion to the fineness of its particles; the smaller the particles the greater the chemical activity, and the more cementitious value, as a material of construction. For this reason it is much more economical to use very fine ground cement, although somewhat higher in price than the coarser grade of material formerly produced. The reduction to powder of the cement clinker is obtained by several classes of machinery, all of a heavy and powerful type necessitated by the extreme hardness of the material to be pulverised. The method of grinding with millstones has been superseded by many kinds of modern machinery, such as machines of the vertical and horizontal edge-runner type, but the class of machinery mostly used for very fine grinding is represented by the revolving tube system, containing steel balls and flint pebbles, the machine containing the steel balls being known as the ball mill and the latter with pebbles as the tube mill.

The material from these ball mills is then introduced into the finishing or tube mill, a revolving cylinder about 26 feet long by 5 feet in diameter, carrying a charge of round flint pebbles sufficient to about half fill the mill. As the mill revolves the cement in a coarsely-ground state delivered from the ball mill is crushed between the large mass of rolling stones, and finally leaves the mill at the other end, passing from one end to the other, during the whole time subjected to violent attrition between the stones and sides of the mill.

The most modern practice in the grinding department has led to the reduction of the clinker to such extreme fineness that from 85 to 90 per cent., or even more, will pass through a sieve having 32,400 holes to the square inch.

It is at this point of the manufacture that the regulation of the setting time of the cement is effected. A thoroughly well-made and finely-ground Portland cement is always when first ground, very quick setting. The more thorough the amalgamation of the raw materials the more perfect the calcination, and the finer the grinding the greater the chemical activity of the cement produced when mixed with water, and therefore the quicker the set.

Except for work under water a very quick-setting cement is not desirable, and therefore it is necessary for the manufacturer to neutralise the initial setting of the cement by one or other of the recognised methods. Hitherto this has been done by the addition of various small percentages of gypsum (CaO SO_3), but as some engineers have an objection to admixture of this material the manufacturer was left to seek some other means of attaining the same object.

A new and very effective system, which has been in use now for some time by the Associated Portland Cement Company, consists of subjecting the cement in the final stage of grinding to a moist atmosphere. This is done by injecting into the tube mill already described a quantity of steam, regulated at will, which keeps moist the atmosphere in the enclosed mill, so that as it revolves, carrying up and rolling over the stones and cement therein, every particle of the latter is subjected to a continuous and repeated process of superficial hydration, eventually leaving the mill in the finished condition, each molecule of cement equally treated. The process is one of great simplicity and follows quite natural lines. It is well known that a quick setting cement, if allowed to become aerated by exposure to the atmosphere, becomes slow setting, and that in proportion to the period of aeration, through the absorption of water and carbonic anhydride (CO_2) from the atmosphere. This action is very imperfect, however, when cement is stored in bulk, and can only be in a measure successfully accomplished by continually turning over the cement and exposing fresh surfaces for aeration.

The new system was perfected to overcome these difficulties, and it will be readily understood that the amount of hydration or aeration that each atom or particle of cement is subjected to under the new process during a period of one or two hours in the moist atmosphere of the rolling-tube mill is much more perfect than is the case when cement is stored in bulk and depends on absorption from the atmosphere for its aeration.

It is not generally known that the free or loosely combined lime in cement will not absorb carbonic anhydride from the atmosphere until it has first taken up moisture and become converted into the hydrate, in which condition

is free to absorb carbonic anhydride from the air, being converted into inert calcium carbonate.

The effect of the hydration process, as adopted by the associated Portland Manufacturers (1900), Ltd., is, first, hydrate any trace of free lime present, and, secondly, hydrate the loosely chemically combined aluminates of lime, to which latter are attributed the quick initial setting properties of the cement.

The system permits of such minute regulation, depending on the amount of steam injected, that the setting time of the cement being produced can be permanently regulated to comply with the requirements of any specification, the maximum absorption, even for a slow-setting cement, being less than 1 per cent. Having passed this final stage of the manufacturing process the cement is delivered to the warehouse, where it remains until the mechanical heat due to the friction of grinding is eliminated, when the cement is ready for immediate use.

It is not out of place at this point to mention that many of the methods of testing and weathering cement adopted by engineers in the past are not only quite unnecessary, but actually harmful to the product of the present day. It has been a custom for many years with a large number of engineers to bulk and store their cement at their work for very considerable periods of time, going to very great expense in elaborate arrangements for turning over the cement periodically to expose it to the atmosphere. All these arrangements were admirable in the past, when Portland cement was a very unstable and unreliable material, and when at times it was really essential that the fiery nature of the product should be in some measure neutralised before introduction into the work. The cement manufacturer of the past was perhaps himself responsible for many of these conditions by careless and rule-of-thumb methods of manufacture, which resulted in a product which the engineer found to be at times quite unsafe unless treated by some such method as described. It will be some time, however, before the engineer realises what an immense improvement has taken place in recent years in the manufacture of this important building material. He is so wedded to his old habits and customs in connection with a material which has been so long known to him, that it is extremely difficult to persuade him that the methods applied to cement manufactured under the conditions which I have been endeavouring to describe have only the effect of deterioration rather than improvement.

It is safe to say that some few years back Portland cement which would, immediately upon manufacture and without any cooling or bulking, withstand the most severe test now introduced, viz. that of boiling, was not manufactured. Cement manufactured by the process now under consideration will stand this test immediately upon being manufactured, and therefore to go to any expense in bulking for purposes of improving the quality of the cement is quite futile.

Cement Testing.

We will consider a few points on the testing of cement, and perhaps this may best be done by a reference to the new British standard specification for Portland cement.*

Clause 1 relates almost entirely to the raw materials used in the manufacture of cement, and puts certain limits on the addition of materials used for the purposes of regulating the setting time. It permits of Portland cement being made from a very large variety of raw material, in fact, any material which by intimate mixing or otherwise can produce a raw material of a composition which, when calcined, will produce a Portland cement clinker. It clearly states out that no addition of any material shall be made to the clinker after the same has been calcined, but it leaves the manufacturer an entirely free hand as to the manipulation of his raw materials previous to that most important part of the process, viz. the chemical part, in which the combination of the materials takes place. It also limits the amount of calcium sulphate which is admissible for the purpose of regulating the setting time, or the amount of moisture which may be added by one or other methods to produce the same result. I shall have a few remarks to make in reference to both these latter points when dealing with the question of setting time further on in the specification. No cement to which any material has been added, other than those already mentioned, after calcination would be passed by this clause, which was framed with the object of excluding any cement to which any addition of such

materials as limestone, slag or any other silicious or inert material had been made to the clinker during the process of grinding.

Clause 2 refers only to the methods which are to be adopted by the manufacturer in connection with the sampling of Portland cement after preparation and storage at the factory where the cement is manufactured, or at the works where the same is to be consumed. This clause applies only to cement which is being systematically tested in large quantities, and cannot in any way be made applicable to the small consumer, who has not the opportunity or cannot go to the expense of such elaborate arrangements for sampling the commodity which he is desirous of using.

This clause has no reference whatever to the quality of the cement, and is useful only to the large consumer, and its conditions might be modified to suit the special conditions of any particular contract.

Clause 3 refers only to the sampling of cement when the same is to be carried out in a large way, either at point of consumption or of manufacture. As the previous clause, it clearly cannot be applied to comparatively small users, who may be drawing their supplies of cement in small quantities as required from the factory or from some local agent or merchant who retails the cement in the particular district where the work is going on.

These two clauses (Nos. 2 and 3) refer only to the special conditions between the manufacturer and the testing engineer or the consumer, and are formulated to prevent any misunderstanding on these points, and, as a rule, where cement is being dealt with in a large way the conditions are found to work satisfactorily.

Clause 4, unlike the two previous ones, has a distinct reference to the quality of the cement. It sets out that under the conditions of this specification the cement shall be ground to such fineness that 97 per cent. will pass through a sieve having 5,776 holes to the square inch, and 77½ per cent. through one having 32,400 holes to the square inch. When one considers the fineness of cement customary a few years since, this may be described as a very fine ground cement, but it should be realised that the figures mentioned are the maximum percentage of residue which will be allowed on the sieves described, and it is open to any engineer who may desire cement even finer than this specification stipulates to specify and obtain the same; but as the cost of manufacture is directly increased with the fineness of grinding, the cost of such material is necessarily enhanced, and the engineer who specifies for cement finer than the standard set out in this specification must expect to pay a higher price accordingly.

In making the test for fineness, which is purely a mechanical one, great care must be taken to see that the sieves used are made of the correct standard wire; that usually adopted for all sieves is that the diameter of the wire shall in each case be equal to half the diameter of the hole—thus, for the 76-mesh sieve the diameter of the wire is .0044 of an inch, corresponding to a total wire width per inch of .344 (76 by .0044), or practically one-third of the space; thus each hole of this mesh will be practically twice the width of the wire. For the 180-mesh sieve the diameter of the wire is given in Clause 4 of the standard specification as .002 of an inch; this, however, is slightly greater than would comply with the condition of the hole being twice the diameter of the wire, and it would be found, I think, in continental practice that the diameter of the wire of this sieve is more nearly .0018 than .002. A cement having 22½ per cent. residue on a sieve manufactured with wire .002 inch diameter and 180 mesh would probably only contain about 20 per cent. residue on a sieve with the same number of holes, but manufactured with the wire more nearly corresponding to the standard of a diameter equal to one-half the hole, viz. .0018 of an inch.

The test for fineness can be made by any inexperienced person provided ordinary care is taken in sifting to see that none of the cement is shaken out over the top. The shaking should be continued, especially with the finer sieves, until no more residue is found to be coming through, which point can be readily fixed by sifting over a piece of white paper. It has been said by some that the continual shaking has the effect of still further reducing the residue by attrition, and thus obtaining a lower result than would be represented by the bulk of the cement which is being tested; such a statement, however, can only arise from absolute ignorance of the hardness and refractory character of Portland cement clinker. The real fact is that a very large number of pieces of clinker are of such shape that they

* The Engineering Standards Committee, 28 Victoria Street, W. Price 2s. 6d.

would be capable of passing through such a very small hole provided they can approach same in one direction, and it is these pieces which are the last to come through upon long and continued shaking.

By continued use, especially if kept in damp places, the mesh of the wire is likely to become choked with fine cement, particularly in the case of the finer sieves, when the results of sifting with such sieves are of course unreliable. A sieve can be cleaned by washing in very dilute hydrochloric acid and afterwards in clean water and then thoroughly dried.

Another means of determining the fineness of cement is by means of the "Flourometer," an apparatus designed for removing the powder from cement by means of an air blast, maintained at a constant pressure and blown through a known weight of cement. The process is somewhat lengthy and tedious; the results are also variable if the pressure is not constant, in the same way that results of siftings are unreliable if care is not taken to see that the wire used is of the standard diameter, or has not become corroded by the adherence of fine particles of cement.

The specific gravity test has entirely superseded that known as the "weight per bushel," which for various reasons was most unreliable in its results. The specific gravity test is not affected by the fineness of grinding. This test is applied as a measure of the calcination to which the cement has been subjected, as, should there be any considerable portion of lightly burnt clinker present in the fresh cement, the specific gravity would fall below 3.15, which, in the case of this specification, is taken as the standard for fresh, well-burnt cement.

As Portland cement is affected by exposure to the atmosphere and by absorption of moisture and carbonic anhydride, which absorption affects seriously the specific gravity of the cement, it is essential that samples taken for the purpose of determining the specific gravity should be kept, as prescribed by the specification, in hermetically sealed vessels until the time of test. The difference in the specific gravity when fresh at the manufacturer's works and when sampled after delivery to the consumer is to provide for the absorption which must necessarily take place by the exposure of the bulk of the cement to the atmosphere in transit. The standard adopted is a high one, and the greatest care would have to be taken in the manufacture to produce a cement of this kind. It should also be remembered that it is not always possible to test cement immediately it is made; the manufacturer may for various reasons have to keep the cement in stock for some considerable period before the engineer or expert arrives to draw his samples, and, although the cement when ground may have been of such high specific gravity as to pass the standard mentioned, it may yet by absorption in bulk have fallen somewhat below that mark before sampling, and therefore before testing. When such is the case due consideration should be given to the length of time which has elapsed between the time the cement was ground and that of testing. It is well known by past experience that fresh Portland cement when exposed to the atmosphere for some time increases somewhat in bulk. This is due to the fact that moisture and carbonic anhydride is absorbed from the atmosphere, converting that not inconsiderable portion of free lime which was more or less always present in cement manufactured by the old rule-of-thumb methods into carbonate of lime having a specific gravity ranging about 2.75. It follows, therefore, that this would have the result of reducing the specific gravity of the cement in question by making it comparatively more bulky. It is well known that the specific gravity of a substance denotes the ratio of the weight of any volume of that substance as compared to an equal volume of pure water at its maximum degree of density, 4 degs. Cent. or 39.9 degs. Fahr. Great care should be taken to distinguish between a low specific gravity due to excessive aeration and one which is due to an improperly or insufficiently calcined clinker. This point can be ascertained by the application of tests for soundness which are described later in the specification.

Chemical Composition.

It was formerly the custom, in compiling specifications for cement, to state a maximum and a minimum percentage of permissible lime; this was done frequently quite regardless of the acid constituents which went to make up the chemical compound known as Portland cement. The method adopted in Clause 6 of the specification is much more rational than that just described, and it leaves the manufacturer a much

greater scope for the improvement of his manufacture. With some materials it is possible for the lime present in the finished cement to be as much as 65 per cent., and to be a thoroughly sound cement; this is a test, however, which can only be carried out by the expert or chemist, and is invariably engaged when a chemical analysis is stated.

Clause 7 describes the method of gauging cement for the purpose of testing. There is some little ambiguity in the clause, ever, as to the proportion of water which shall be used for this purpose. It is customary with many, although using a percentage of water for gauging which will result in a plastic briquette when moulded, to so mix the cement and water that the mixture is kept in the form of a dry powder until it is packed into the mould; this has the effect of preventing air bubbles being interlocked between the particles of cement forming the briquette, all these bubbles finding their way out through the cement before the sample is eventually shaken down in a plastic mass into the mould. If the cement is gauged with a trowel into an easily workable paste before being placed in the mould it is impossible to remove the air bubbles which may be enclosed, the presence of which in any quantity results in a faulty briquette. The clause stipulates that the cement shall be gauged and filled into moulds without mechanical ramming, by which it would appear that any method of packing cement into the mould, other than by the use of recognised automatic mechanical hammers used more particularly on the Continent, is permissible.

A good deal has been said from time to time as to the varying results that may be obtained by more or less ramming the cement into the mould. As, however, the specification requirement is a given strength on a given section of cement it follows that that section, usually a square inch, should consist as far as possible of nothing but cement, that in as compact a condition as possible; and as it would appear to be physically impossible to pack into a mould more than it is capable of holding no amount of ramming, so-called, even mechanical ramming, can place any material in that mould than is covered by the requirement of the specification. Much more uniform results would be obtained at varying testing stations if more attention was given to this point, and the conditions so arranged that the maximum amount of cement that the mould was capable of holding was placed therein.

The automatic hammers, which are indirectly referred to in the specification, are largely used for gauging cement on the Continent, and the result is a much more compact briquette than one which has been loosely gauged and filled by hand, and this fact has frequently been lost sight of when comparing results obtained with some brands of foreign cement to well-known English brands. It is clear that no fair comparison can be made unless the conditions for gauging are identical in all respects, and by the British standard specification mechanical ramming is barred.

A new and important feature is introduced in Clause 8 of this specification, viz. in the fixing of a sliding scale of percentage increase in strength between results obtained with the same cement at seven and twenty-eight days, and the more modern methods of manufacturing cement resulting in a very much finer product than was formerly the case, much higher strengths are obtained at early periods, and which experience showed were not obtainable with the less reliable cements of the past.

Clause 9 relates only to the method of making briquettes and the results to be obtained with the cement when tested with known proportions of sand. The proportion of sand found most suitable when one part of cement and three parts by weight of dry standard sand are being gauged range from 7 to 9 per cent. of the dry mixture.

Clause 10, referring to the setting time of cement, rightly takes cognisance of the fact that cement having different properties as regards setting is requisite for various descriptions of work. In this case the specification distinguishes between the three descriptions of cement, "quick," "medium" and "slow," the engineer or consumer himself deciding which of these descriptions he will require for the work he may have in hand. As stated in the earlier part of this paper, all cement when fresh sets is quick setting, and it is only by the addition of certain percentages of gypsum or by the method of hydrating already described that the setting time of a cement can be regulated without deterioration. The effect of slow setting would be produced by long storage with a cement without such additions, but the aeration would have been extended to such a degree to obtain a slow-setting cement.

h would be quite detrimental to a thoroughly sound well-balanced cement, and very considerable loss of strength would be incurred; it is therefore preferable when a quick-setting cement is not required that the retardation of the setting time should be effected by one or other of the known processes. In cases where the engineer resorts to the use of gypsum, there is no other method open to the manufacturer than that of hydration or aeration.

The method of determining the setting time of cement is somewhat ambiguous, as the stage when no impression is made is somewhat difficult to determine, because many experiments will continue to show an appreciable impression after the setting of the cement has been completed while hardening is in progress. It would be better if some definite depth of impression could be determined upon and measured by some simple apparatus which would clearly define this point.

The test for soundness, referred to in Clause 11, is the severe test that has yet been introduced, and a cement capable of passing this test is undoubtedly of a high class. It is, however, on the side of severity, as thousands of samples of cement manufactured in the past, which have been tested in excellent work, and also much cement that may be manufactured in the future, which may also do good work, would fail to pass this most stringent test.

THE BUILDINGS OF THE WORLD'S FAIR AT ST. LOUIS, 1904.*

(Concluded from last week.)

Mines.

COMMENCING at the eastern end of the Grand Transverse Avenue and proceeding westwards we first notice the Mines and Metallurgical Building on our left and the Liberal Arts Building on our right. The Mines and Metallurgical Building, measuring 525 feet by 750 feet, was designed by Theodore C. Link, of St. Louis. The great overhanging eaves was a distinguishing feature, the eaves projecting for more than 18 feet beyond the face of the loggia. The piers in the loggia had capitals of an Ionic type, while the columns upon the screen walls were of a Byzantine type. The screen walls were filled with sculptured panels representing various branches of mining and metallurgy. The central entrances—those on the north and west—were surmounted by a globe 30 feet in height, which was supported by colossal figures 28 feet high and surrounded by other finely modelled groups of even larger size. Great obelisks 140 feet in height flanked these entrances, but unfortunately were placed too close to the building, having the appearance of being jammed up against the walls. Moreover, they hid the sculptured groups and globes from most points of view. These obelisks were intended to emphasise the greatest mining (quarrying) feat of antiquity performed by the Egyptians thousands of years before the Christian era. The cost of this structure was about \$85,000.

Liberal Arts Building.

The Liberal Arts Building was designed and entrusted to Messrs. Barnet Haynes & Barnett, of St. Louis, and was of the same dimensions as the Mines Building just described. It was alleged to be designed in the French Renaissance style, and the treatment was described as being somewhat severe. The main façade to the Grand Transverse Avenue had a colonnade of coupled columns of the Roman Doric order. The principal entrance, in which the Corinthian order was employed, was in the centre of this side, and was taken considerably above the main roof in an abrupt manner. Similar entrances occurred at the extremities of this front, and semicircular pavilions crowned with domes were introduced at the corners of the building.

Education Building.

The Education Building, designed by Messrs. Eames & Eames, of St. Louis, was situated next to the Mines Building, and was entirely surrounded by lagoons, which contributed largely to its effect. Its position rendered it one of the most conspicuous buildings in the main picture. In plan it was the shape of a keystone to an arch, and covered an area of about 9 acres. The Corinthian order was employed in the colonnades, the giant column being

50 feet in height. The main entrances, which were placed in the centre of each façade, resembled somewhat the well-known form of the triumphal arch, and were surmounted with finely modelled quadrigas. The break in the façade to the Grand Transverse Avenue was very successfully treated in a simple manner by slightly projecting the main entrance. The cost was about 75,000.

The Manufactures Building.

The Manufactures Building, by Messrs. Carrère & Hastings, of New York, faced the Education Building on the opposite side of the Grand Transverse Avenue. It covered an area of about 14 acres. The northern and southern façades had breaks in them, the former having an entrance resembling a great triumphal arch, and the latter a deeply recessed arched opening which interrupted the lines on either side of the break. The corner entrances were skilfully contrived, and were surmounted with flat Roman cupolas. This building was raised on a stylobate of steps, and the Corinthian order was employed in the façades. The northern and southern fronts had arcades, the columns being placed in pairs to the piers between the arches. The crown of the latter was close to the cornice, which ran continuously round the building. This structure cost about 144,000, being a greater sum than was spent upon any other main Exhibit Building.

Electricity Building.

The Electricity Building was similar on plan to the Education Building and also occupied about 9 acres. It was designed by Messrs. Walker & Kimball, of Boston and Omaha. It was situated on the other side of the grand basin from the Education Building, and like the latter, was surrounded by lagoons. The Corinthian order was employed externally in all the façades, the columns resting directly on the ground. Had these been raised upon a stylobate of steps there would have been a gain in dignity to the building. The raised pediments over the central entrances and the low towers at the angles of the structure accentuated the façades. The treatment of the break in the northern façade was not a happy one, since, the entrance being recessed, the awkwardness of this undesirable feature was emphasised. The cost of this building was some 85,000.

The Varied Industries Building.

The Varied Industries Building was designed by Messrs. Van Brunt & Howe, of Kansas City. It was situated on the opposite side of the Grand Transverse Avenue to the Electricity Building, and covered an area of similar shape and size (14 acres) to the Manufactures Building. The Ionic order, standing on a lofty rusticated base pierced by arch openings, was employed throughout in the façades. This building had a break in its northern and southern fronts, each of which were successfully treated. That on the north front was disguised by a circular colonnade, while that on the south front had a free-standing colonnade which curved outwards in front of it. Domes were placed over the central entrances to the north and south fronts; while the central entrance to the eastern front was elaborated, having large coupled Ionic columns surmounted by a triangular pediment. Twin belvedere turrets, with conical roofs, flanked this entrance. The cost of the structure was about 142,000, the second most costly building erected by the Division of Works. I might mention here that the four buildings last described, namely, the Educational, Liberal Arts, Electricity and Varied Industries Buildings, were provided with internal courts, but owing to the demand for more exhibit space these were roofed over to a great extent, the Electricity Building suffering least in this respect.

Machinery Building.

The Machinery Building was designed by Messrs. Widmann, Walsh & Boisselier. It was situated to the east of the Electricity Building in a position corresponding to the Mines Building, and its main dimensions were 1,000 feet by 525 feet. The northern façade had an arcade of seven arches as the central feature, above each extremity of which rose lofty towers in three stages. The remainder of the façade had an arcaded treatment, the Corinthian order being used, and the corner pavilions were accentuated by towers of similar design to those at the main entrance, but without the middle stage. These towers, while well proportioned in themselves, appeared out of scale with the whole. The cost of the structure without the sculpture was some 110,000.

Transportation Building.

The Transportation Building was designed by Mr. E. L. Masqueray. It was situated opposite the Machinery Build-

*A paper by Mr. H. Phillips Fletcher, read at the meeting of the Architectural Association on Friday, April 14.

ing in the Grand Transverse Avenue, and occupied an area of over 15 acres. The eastern and western façades had an arcade of three great arches, which formed a distinguished feature. This feature was to have been repeated in the centre of the long façades, but omitted in execution. Simple but well-proportioned three-light windows were ranged along the northern and southern façades, at the extremities of which appeared a single arch of similar design to those in the extremities and western façades. Sculpture was sparingly used, the architect depending more upon proportion and mass effects for the success of the design. The cost of the structure was close upon 138,000*l*.

Agriculture Building.

The Agriculture Building was allotted to Isaac S. Taylor, the director of works, to design. It was 1,600 feet long and 500 feet wide, and was situated quite apart from the main scheme and westwards of it. It was divided into nine aisles, with eight rows of columns, which supported the roof trusses. The centre span was 105 feet, and it would have been better if the remainder of the width of the building had been roofed in four spans instead of eight. As it was, when viewed from the side there appeared quite a forest of timber columns, which were somewhat confusing. However, the plan was simple and could be readily divided into exhibit spaces, while the lighting was irreproachable. There were five main entrances to this building—one in each of the northern, eastern and southern façades and two in the western façade. These were 52 feet wide and 74 feet high, and each consisted of a great arched opening, the upper part of which was glazed. Around these openings was concentrated the ornament, and each was flanked by square piers, surmounted with decorated flagstaffs. Along the eastern and western façades were ranged piers at intervals of 100 feet, and practically the whole of the wall space between these was occupied by windows. This building was the largest in the grounds, yet its cost was only 110,000*l*.

Horticulture Building.

The Horticulture Building, which was located south of the Agriculture Building, was still another by Mr. E. L. Masqueray, and the design was very simple. The main entrance projected boldly, and the doorway was a large square-headed opening. It consisted of central portion, 380 feet square, and eastern and western wings, each 205 feet by 235 feet. These wings were divided off from the central block by glazed partitions, the eastern one being used as a conservatory. The cost of this building was rather more than 51,000*l*.

Forestry, Fish and Game Building.

The Forestry, Fish and Game Building was yet another which was designed by Mr. Masqueray. It was situated to the north of the Agriculture Building, and was the smallest of the main Exhibit Buildings, being only 600 feet long by 300 feet wide. The exterior was simple and unpretentious, yet designed in good taste, and the general effect was pleasing. The long façades were terminated by simple gables, and "pent" roofs were supported on brackets above the windows to these fronts. The eastern and western fronts had central gables with triangular-headed groups of windows, which latter feature occurred in the gables to the northern and southern fronts.

Administration Building.

The Washington University Building, with the grounds as already mentioned, were leased to the Exhibition authorities for the period of the "Fair." There are eleven buildings altogether, which are built in what we are told was Tudor Gothic style, and four of the buildings are arranged round a quadrangle. The materials employed are red Missouri granite and cut stone dressings. The principal building is the University Hall, which was utilised for administrative purposes. The central entrance is under a massive square tower, with octagonal towers at each of its angles, which are continued above the battlemented parapet as turrets. The entrance is roofed with a large groined vault in stone. The entire building is of fireproof construction and cost about 52,000*l*. The other buildings of the University were utilised for various purposes, the Division of Works being accommodated in one, while another was used for the anthropological exhibit.

Washington State Building.

The Washington State Building was a unique structure specially designed to demonstrate in its construction the vast lumber resources of the state. The great timbers, which have the appearance of raking shores, were over

90 feet in length, with a scantling of 24 inches by 28. These supported all the floors of this five-storey building. The interior was finished in the finer grained wood produced by the state.

Japanese Pavilion.

As might be expected, Japan fully established herself to be recognised as a competitor to European nations. She secured some of the best sites on the grounds. Japanese exhibits were both varied and extensive. They went a long way to show the resourcefulness of the Japanese. The chrysanthemum. The Mikado's Pavilion will be recognised as a typical Japanese structure.

French Pavilion.

The Grand Trianon at Versailles, which was designed by Mansard, was reproduced at the Exhibition in the French Government Building. Unfortunately the colouring, which were intended to represent the marble of the original, were badly painted and entirely spoil the effect.

German Pavilion.

The castle at Charlottenburg was taken as the model for the German Pavilion, but the most that can be said for the latter is that it was given an appearance of age by the "staff."

British Pavilion.

The Royal British Pavilion, like the French and German pavilions, was designed after a typical English building. The Orangery of the palace at Kensington was adopted as the *motif*, and the architects, Messrs. Ernest George and Philip Yeates, are to be congratulated on their work. The building was erected by Messrs. Trollope, and was constructed of Portland cement on metal lathing. It was undoubtedly the best-built pavilion on the grounds, and was negotiated by the authorities of Washington University as a student club-house.

The British Commissioner, Colonel Watson, R.E., C.M.G., was quartered here, and it was due to his energy and enterprise that the British section was the only one in complete readiness on the opening day.

The view now on the screen shows the fitting furnishing of one of the rooms of the British Pavilion. The old English formal garden was laid out near the pavilion. This was a marked success, and created a great interest and admiration. The portion in the Art Building occupied by the British section approached the ideal of an art exhibition should be. All the pictures were labelled with the subject and name of the artist, which rendered a continual and worrying reference to the catalogue unnecessary.

The hon. secretary of the exhibit, Mr. J. Spence, worked unceasingly for the success of all the British sections, and it was largely due to his instrumentality that Britain took the foremost place in the fine and applied sections. The British Commission was fortunate in securing the assistance of Mr. R. Hunt and Mr. A. A. Long in these sections, and the admirable way in which they conducted their departments at the Exhibition was an excellent lesson to the foreign countries in the Fine and Applied Building.

We have reason to feel proud of the Motherland, for British exhibits were well to the fore in most of the sections. British firms were awarded the following by the jury: 121 *grands prix*, 238 gold medals, 162 silver medals, 132 bronze medals, making a total of 653 medals. This is somewhat encouraging, and speaks more eloquently than words of the vitality of British craftsmanship.

"The Pike."

Before concluding, a few words might be said about the amusement concession. This was known as "The Pike," and was a street about a mile long. Here interesting side-shows were located, as well as exhibits of practical value, among which might be mentioned the "Fighters" referred to in the early part of this issue. Among other buildings there was a reproduction of the Abbey, while the Irish Village, the Tyrolean Alps, Hagenbeck's Zoo Creation and a host of other things crowded this well-patronised section of the Exhibition.

Conclusion.

The record which the great Exhibition holds of itself is unchallenged. Financially it was a failure, and it is improbable that any community will invest money in an undertaking in the future.

Few who visited the Exhibition had anything

cient time at their disposal to see it entirely. Great strength and endurance were essential to those who d to visit all the buildings, of which there were over hundred on the grounds. Many of these were exhibi- in themselves. Anyone who wished to see all the bits in the Agricultural Building was in for a walk of ten miles.

idences of fatigue were frequent, the ambulance kept busily employed. The glare of the ivory white great buildings was most trying to the eyes, and boys busy trade selling smoked glasses.

the Exhibition in itself was typical of the American everything savoured of their desire to create some- that was the "largest on earth." And this all-absorb- ing after magnitude resulted in the neglect of many and in the general want of harmony that prevailed, it would appear that the principles of Tammany Hall not always confined to the great city of New York.

vertheless, one is bound to admit that from an educa- point of view the Exhibition was a great success. It be remembered that it was situated in the centre of a country devoted to agriculture and the extraction of ral wealth, and that the principal people who passed h the gates were mechanics and farmers. The Exhi- was of such a character as to bring home to these es not only the latest inventions in machinery and iciency which they would otherwise have been unable serve, but the ideas and products of each nation could duced side by side. And as one saw the intelligent ers and their families day after day coming in train- to see this "World's Fair," and as one watched them ing the huge Agricultural Building, one could not but hat at least this Exhibition was educating just those to n it would be of the most practical value.

occurs to one that the sturdy men of the Western s will form the backbone and steadying influence of American nation in the future. They are the true en of the Republic, and each tills his own land for his uses and sells the surplus, which is the ideal method riculture.

ne is apt to look upon Americans generally as being nervous, excitable temperament, and this to some holds true with regard to the true Yankee of the New and States; but the inhabitants of the West have that ility of character that will help in the future to weld ner the extremely diversified attributes of this cos- litan race, and will, we hope, do something to divert hich seems to be the pending catastrophe, viz. civil between capital and labour, engendered by the forma- of the enormous and apparently unscrupulous trusts.

olonel C. M. WARSON, R.E., British Commissioner of English Section of the St. Louis Exhibition, in proposing e of thanks to the author of the paper, said the slides he description of them had brought back to him many y days which he had passed in the Exhibition. Some e days were accompanied perhaps with more hard than with happiness, but the control of such an rtaking necessarily meant work. He agreed with the rks Mr. Fletcher had made in his paper. The build- were magnificent outside, and it was quite a fairy when the cascades were illuminated and the halls lighted up by festoons of electric light. In some cts the night view was more satisfactory than the day. any cases the exteriors of the buildings had been ned by one architect and the interiors by another ou, the elevations, indeed, having been designed before interiors were planned. The lighting was not always and in some cases it was excessive. For exhibition oses the best interior was that of the Agriculture ing. It was one of the best lighted, and the view was obstructed by the wooden columns and girders as in of the other buildings. The exterior was not remark- but speaking generally it was an admirable building. e Agriculture Section they did not hear of the oak keys g out to the danger of visitors, but certainly in the ruction of the other buildings it would have been r if some other method had been employed. Screw ight have been used. Referring to the English al garden, the speaker said it was really one of the beautiful spaces set out in the Exhibition, and the e and quiet therein was appreciated by innumerable rs.

r. A. A. LONGDEN, who seconded the vote of thanks, he was sure the Exhibition had done an enormous unt of good in an artistic sense to the people out West. r. A. O. COLLARD said that, after hearing the paper

and seeing the views of the St. Louis Exhibition, he wondered whether they were progressing in the right direction as regarded temporary buildings, and it might be questioned whether it was well to enclose the framing of such buildings in plaster. In the opinion of some the building of the Exhibition of 1851 was the ideal method of construction, and the further away, therefore, they got from that example the further they got from good temporary building. Fibrous plaster was undoubtedly the best material to use in the enclosing of temporary buildings provided it was always beyond the reach of people's hands, and in the open air it should be kept painted.

Mr. BANISTER F. FLETCHER suggested that the designing and erecting of exhibition buildings could offer great scope to architectural skill. The Parisians, however, were the first to look upon such occasions as opportunities for doing something quite novel in the matter of design, and at great expense they did produce an inferior kind of architecture, using iron and terra-cotta. The attempt seemed to have died a natural death, for neither at the exhibitions of Chicago or St. Louis was the experiment repeated, nor was anything novel in architectural design effected. Yet it did seem that something might have been done to evolve a wooden or timber architecture—work in those materials could express the skill of the designer. Still, the architects of the States were to be honoured for the enormous ability they had shown at St. Louis, and their success was well merited. There could be no doubt that in no other country could such an architectural effort on so large a scale be seen.

It was announced that the annual dinner of the Association would be held at the Criterion Restaurant on May 18.

MR. T. J. BAILEY.

THE general purposes committee of the London County Council in their last report say:—"The Council, on November 8, 1904, decided that a survey and inspection of the non-provided schools (some 500 in number) should be undertaken and completed as rapidly as possible, and a report made to the Council on the whole question before the close of the financial year. The work of the survey has been carried out by Mr. T. J. Bailey, the architect (education), and as he is one of the chief officers of the Council, the question of remuneration to be made to him for the work falls within our reference. We have considered the work which Mr. Bailey has been specially engaged upon, and have had before us a paragraph in the report made to the Council by the education committee on July 25, 1904, which is as follows:—

"In regard to Mr. T. J. Bailey, the architect of the late School Board, we are of opinion that the educational requirements of the Council in the matter of architecture and cognate work are so special in character and so considerable in extent, especially in view of the necessity of the inspection of non-provided schools, that it will be desirable for the present to continue an architectural department for education. We are of opinion that Mr. Bailey should be placed at the head of such department at his present salary under the title of architect (education). It will follow, then, that the existing staff of the architect's department of the late Board will be placed in this new department at their present salaries. Mr. Bailey's duties will, of course, be increased, and it will no doubt be the wish of the Council that this shall be duly taken into consideration at the proper time in connection with the annual revision of salaries."

"The Council approved the report, and subsequently on October 11, 1904, decided that Mr. Bailey should rank as a head of a department. We are clearly of opinion that the increased work that has devolved upon Mr. Bailey justifies the Council in giving him additional remuneration, but it appears to us that the present is not an occasion for an increase of salary so much as for payment for a definite piece of work. We understand that the survey, which has been most thoroughly and systematically carried out, has kept Mr. Bailey employed almost day and night for months past; that he has devoted the whole of his spare time and his vacations to it; that he has personally visited every school, and has gone most minutely into every detail of the survey. Mr. Bailey brought an unique experience to the work, and without the services which he has so successfully and willingly rendered it is exceedingly doubtful whether the Council could have completed the survey within the required period.

"We have also considered the fact that Mr. Bailey is

sixty-two years of age. He is in receipt of a salary of 1,200*l.* per annum, and as regards superannuation he is under the provisions of the School Board for London (Superannuation Scheme) Act, 1902. In accordance with the rules of the service Mr. Bailey will retire at the age of sixty-five, and in these circumstances any readjustment of salary would not adequately meet the present case. On the ground, therefore, both of the value of the work done and of the position occupied by Mr. Bailey, we think that the remuneration should take the form of an honorarium and not of an increase of salary, and that the amount of such honorarium should be 1,000 guineas."

THE FORUM EXCAVATIONS.

ACCORDING to the correspondent of the *Morning Post*, recent excavations have not been of so striking a character if compared with the results of last season. There has been a great deal of rain during the winter; the holes in the Forum have thus been filled with water, and in consequence it is not yet possible to resume work at the Lacus Curtius. Signor Boni is only waiting till after the heavy rains, which often fall in May, to resume his explorations at that interesting spot. His men are at present engaged upon the Clivus Palatinus, where he is determining the position of the shops which in ancient times lined the side of that road. He has found traces near the upper part of the Via Sacra of the reconstruction of the Temple of the Lares Publici by Augustus. The Mediæval dirt which had accumulated on the Via Nova under the Palatine has been removed, and the result has been to prove that that road was in classical times a *porticus*. On the opposite side of the Forum a fine piece of ancient pavement, composed of green and orange slabs of marble, has come to light in the Basilica Maxentiana, where work is now proceeding. In the course of the summer Signor Boni hopes to go on with the exploration of the Temple of Jupiter Stator on the left side of the Clivus Palatinus. During the excavations near the Arch of Titus a very perfect Mediæval limekiln has come to light, a proof of the way in which so many priceless marble monuments disappeared in the days before archæologists.

GENERAL.

Mr. Charles Bennett Arding, of Streatham, and late of the firm of Arding, Bond & Buzzard, Surrey Street, Strand, London, surveyors, has left property valued at 27,587*l.*

The Governors of St. George's Hospital have decided to make a special appeal for a sum of 350,000*l.* for the purpose of rebuilding the hospital on its present site. The plans were prepared by Mr. H. Percy Adams, who estimated the cost at 300,000*l.*

Lord Bute has had plans prepared for a Roman Catholic church to be presented to Rothesay, Bute. The designs were by Mr. Weir Schultz, London, and are in the Norman style, with a round tower and spire 140 feet in height. The tower is to be furnished with a belfry and peal of nine bells, and immediately above the sanctuary there is a smaller tower with an angelus bell. The church is to seat 1,000. The site is within the grounds of Lady Bute's orphanage. The total cost will be about 30,000*l.*

The Result of the competition for the new Council schools in Rochdale Street, Preston, has been announced as follows:—(1) Herbert Howarth, Morecambe, 50*l.* premium; (2) A. Brocklehurst, 30 Brown Street, Manchester, 30*l.* premium; (3) F. Quentery Farmer, 36 Dale Street, Liverpool, 20*l.* premium.

The Holborn Borough Council last week considered the recommendation of a special committee as to a reduction in the borough surveyor's staff. It is asserted a saving would be effected of 1,843*l.* per annum without any sacrifice of the efficiency of the department. The report was referred to the works committee for further consideration by eighteen to thirteen votes. The question of compensating the officials whom it is proposed to dismiss will be dealt with by the establishment committee.

The Estate of the late Samuel John Thacker, of Messrs. Thacker & England, Montague Street, Bloomsbury, architects and surveyors, has been valued at 60,193*l.*

The Metropolitan Faving Committee have issued invitations to road authorities to a conference at Westminster City Hall on May 19, to consider the opening of the streets by the Postmaster-General and public companies, with a view to taking steps to obtain further powers for the protection of traders and the public.

The Rev. H. G. Woods, D.D., will deliver three on the Young Velasquez, the Court portrait-painter the Impressionist, at the Royal Institute of Great Britain.

The Congress of French Archæologists will be held at Beauvais from June 20 to 28 under the presidency of M. Lefèvre-Pontalis.

Mr. H. Inigo Triggs, who has for some time been engaged upon a large work on "The Formal Garden in Italy," has received permission to dedicate it to his daughter, Margherita.

The Bexhill Town Hall Extension Committee have considered two sets of designs prepared by Mr. H. G. Triggs, architect, for extension of town hall, recommending set of designs No. 1 be adopted, the estimated cost of the extension being 3,160*l.*

M. Bonnat, the portraitist, has been appointed successor of M. Paul Dubois, the sculptor, as director of the Ecole des Beaux-Arts. He will undertake the duties of the office in October.

The Mansions in Paris which have been selected for the last "concours de façades" are 98 Avenue de la République, M. Natanson, architect; 98 Quai de la Rapée, M. Natanson, architect; 250 Rue St.-Honoré, M. Sibien, architect; Claude-Chahu, M. Klein, architect; 96 Rue de Valenciennes, M. Walwein, architect; 51 Rue Damrémont, M. Walwein, architect.

Mr. W. C. Fenton has resigned the duties of secretary of the Sheffield Society of Architects and Surveyors, and has discharged for the past eight years. Mr. J. R. Fenton has been appointed his successor.

The Executive of the International Fire Service held a meeting at Brussels on Monday to arrange for the coming year, and to prepare a programme for the proposed International Fire Service Congress in May 1906.

Miss Marie Corelli, writing from Stratford-on-Avon, in the *Doncaster Chronicle*, says:—"I am of opinion that the strict preservation and care of the town of Stratford-on-Avon itself, and the restoration of those many houses which it still possesses to their former beauty together with such measures taken as shall tend to add charm and loveliness to its surroundings of river, woodland, would be the best 'National Memorial' and the one most likely to be appreciated and loved by pilgrims of the world."

The Inhabitants of Hythe have formed an association the object of which is to preserve the beauties of the town and district. The Corporation is to be approached with a request that it will endeavour to prevent new houses being built so arranged as to obscure the view of fields and the sea-front.

The Liverpool and District Property Owners' Association discussed last week the report of the Arbitration award. The course adopted by the Corporation was condemned, and a strongly worded protest is being sent against any desire of the water committee to take action in the matter.

Mdme. Carrière-Belleuse has bequeathed to the City of Paris several valuable works of art as a souvenir to her husband, the sculptor, who was at one time employed in England, and was afterwards art director of the Manufacture de la Porcelaine.

Mr. Alfred Spiers, architect and surveyor, formerly of Berwick Street, Oxford Street, has entered into partnership with Mr. Peasgood, of Walbrook. The firm will be known as Peasgood & Spiers.

Ferro-Concrete has been used for the transit sheds adjoining the new dock of the Manchester Ship Canal. Each shed is four storeys high.

Lord Kelvin is the first recipient of the John Fritz Medal, which was awarded by representatives of the American Society of Civil Engineers and other engineering societies.

The Report of the Palestine Exploration Fund for the year ending last year the operations revealed a large palace of about B.C. 2000, not yet fully excavated; the palace built for himself by Simon Maccabæus; upon which an imprecation, containing the name of Simon, has been inscribed, besides a variety of relics of different periods.

The Hawkins Collection, the sale of which has been held on several days, has realised about 190,000*l.* The principal objects were as follows:—Snuff-boxes, first portion, 1,100*l.*; pictures and drawings, 8,151*l.*; books, &c., 3,358*l.*; and of art, second portion, 77,572*l.*; third portion, 41,900*l.*

COUNTY SESSIONS BUILDINGS, PRESTON.

HENRY LITTLE, Architect.

The Architect.

THE WEEK.

THE Norwich County Council are in a difficulty about the erection of an addition to the Shire Hall. Beside the building is a vacant plot of ground, of which neither the area nor the suitability to carry a building has been ascertained. A committee report says that intending competitors must assure themselves of the exact dimensions of the site, and as it is believed to have formed part of the castle moat the made ground must be of considerable depth. The risks of a successful competitor are therefore serious, for he will have to deal with the unknown. Some of the Council believe that no designing is needed, for all that has to be done is to imitate the Shire Hall, while the report says that as to the front part of the Shire Hall may have to be rebuilt, competitors should remember that continuity. In other words, the building may be altered to be in keeping with the addition. The new part is to be made from thirty-six to forty rooms for the different departments. The condition that the accommodation is to be provided for 12,000*l.* suggests that economy is not neglected. But an amendment was adopted in which the cost is not to be mentioned, in the hope that a still cheaper building can be obtained. There was no difficulty in obtaining the sanction of the Council offering 175*l.* in premiums. We advise intending competitors to be careful in studying the conditions, for there is no unanimity on the subject.

AN important decision affecting drainage districts has been given by Mr. Justice SWINFEN EADY. The County of Lincoln, as is well known, requires special precautions for dealing with running water. In 1804 commissioners were appointed for draining certain parts of the county. They were to construct culverts and keep them in proper order. In 1903 there were extraordinary floods owing to the excessive rain. The premises of B. CANNON & Co., LTD., glue manufacturers, were damaged to the extent of between 3,000*l.* and 4,000*l.* owing to the inaction of an automatic valve which had been in use for over thirty years. It was closed by the formation of a dam and by pumping day and night the plaintiffs were able to clear their works. An action was brought against the West Drainage Trustees, the successors of the original commissioners. The defendants maintained that the floods of 1903 were unprecedented, that the drains were kept in the state in which the Trustees received them, and that the drainage cost amounted to no more than 126*l.* a year. Mr. Justice SWINFEN EADY said it was the duty of the trustees to maintain and keep the drainage works in repair. There was no serious dispute as to the law of the case, for public commissioners were liable for negligence of their servants the same as private persons. Here a public duty was imposed upon them they were liable for the negligence of their servants if that public duty was not properly carried out. The question, therefore, was whether the defendants were negligent or not. When notice was given of the flooding of plaintiffs' premises nothing was done. They were left to take their own steps to ward off the results of the negligence. There must be judgment for plaintiffs, the amount of damage to be ascertained by the official referee.

AN action against an insurance company for the destruction of buildings and other property by volcanic fire is rather unusual. But one has just been tried before the Tribunal Civil de la Seine in which an English company was the defendant. The plaintiff, M. PÉCOUL, claimed 66,500 francs, the amount for which he was insured. The company had guaranteed him against fire of all kinds, even volcanic. When Mont Pelée burst forth in Martinique M. PÉCOUL's buildings were

annihilated by the fire, and for hours they seemed to be a gigantic furnace. The company, however, refused to pay the sum insured. The judges declined to hear any witnesses except scientific experts. M. LACROIX, who was sent out by the French Government to the scene of the disaster, said the eruption was caused by the emission of a burning mass which consisted of solid materials with the vapour of water and gas at a high temperature. Its rapidity was in excess of hurricanes and cyclones, and was supposed to be at the rate of 130 metres per second. The action was of a dual kind, mechanical and volcanic, and the part of the island where M. PÉCOUL's property was situated, which was slightly inclined, was levelled up as if a gigantic plane had passed over it. The destruction, according to M. LACROIX, was not caused by the fire, but by the violence of the volcanic dust, which overthrew and pulverised everything in its passage. The fire was subsequent to the destruction. The decision of the Tribunal was that the ruin of the mansion was to be imputed to another cause than the volcanic fire, and that, in fact, the objects had lost all their value at the moment when they became inflammable. If the evidence of the spectators of the fire were taken, M. PÉCOUL would have gained. But science is often in opposition to the observations of untrained witnesses, and in this case science was successful.

It was decided in the case of *BLUNDELL v. The King* that when the Crown takes land compulsorily under the Defence Acts for the purpose of the erection of a fort the compensation payable includes not only the value of the land, but also compensation for the injurious affection of the owner's adjoining lands by reason of the proposed user of the land compulsorily taken. RIDLEY, J., in so deciding, followed two Irish cases in which the same point had arisen. It was attempted to support the contrary view upon grounds of public policy. Compensation, it was said, should be on a lower scale where the land is taken for national defence than when it is taken for other purposes. The learned Judge, however, could not find that the Acts drew any clear distinction of this nature. Indeed, it is a little difficult to see why considerations of the public importance of obtaining a given piece of land should entitle the State to acquire it for a less sum than it would otherwise be obliged to pay. All legislation providing for the compulsory acquisition of property must be based upon the public importance of the user to which it is to be put. To draw distinctions between varying degrees of public importance, and to say that the greater the importance the less the price, seems to be clearly absurd; yet that is the conclusion to which the argument of the Attorney-General in this case would seem to lead. It is satisfactory to see that the Acts did not compel the Court to put such a construction upon them.

A SOCIETY has been formed under the title of "The Vasari Society for the Reproduction of Drawings by Old Masters." In this country there are a great many examples which are necessarily unknown to artists and amateurs. The subscription will be only a guinea a year, and in return as many permanent collotype reproductions will be produced as funds will permit. In the first year it is proposed to issue a selection of at least twenty drawings in the British Museum by LEONARDO DA VINCI, TITIAN, PISANELLO, JACOPO BELLINI, HOLBEIN, RUBENS and other artists. Subsequently, it is expected that drawings in foreign collections may also be obtained. The wealth of the British Museum is known only to a comparatively few people, and several years ago an effort was made to anticipate the work of the Society by the publication of examples in *The Architect*. We hope the Society will be successful. It often happens that the studies by great masters are more characteristic of their power than the paintings, which may have been in a large measure the work of assistants. Mr. G. F. HILL, 10 Kensington Mansions, S.W., is the secretary.

eyes Stonehenge would be the representative of superstition and an instrument of cruelty, for it might be demonstrated that the stones were used for human sacrifices. He would be within his rights if he demolished the stones or disposed of them to an American millionaire, who wished to ornament a public park with them. What is required is that, in the interests of the country, and as a memorial of an obscure part of its history, something should be enacted which would put a check on an abuse of the proprietorial rights. If Sir EDMUND ANTROBUS were willing there would be no difficulty in now placing the stones under charge of the Office of Works. But there exists no power to coerce him to act in the way archaeologists desire. It is, of course, a difficult and serious matter to introduce a new measure that would interfere with the privileges of landowners, for it might give opportunity for other changes. But the security of the most important of English monuments calls for an extraordinary effort, and Mr. Justice FARWELL'S judgment could easily be made the occasion for an adequate legislative measure.

ENGLAND IN EGYPT.

ARE the Egyptians ever likely to be wise enough to believe that His MAJESTY'S Agent and Consul-General, Earl CROMER, has done more for the present generation of the people than any of the Pharaohs did for their forefathers? Or will explorers ever come across a papyrus roll which will be comparable with one of his Lordship's annual reports? The world now presents no other example of such wise and self-reliant statesmanship being devoted to the service of a strange people, who at any time might rise in rebellion against the Power that has tended them and saved them from misgovernment. At the beginning of his latest report Earl CROMER says his object in writing has been of an educational kind, in the hope that the rising generation of the Egyptians would turn their attention to the future of their country, which is now rapidly striding towards an advanced stage of civilisation. He expresses satisfaction that a considerable number of the last report went to the superior schools and colleges, where they were eagerly read and discussed. Not self-glorification, but anxiety for the welfare of Egypt inspires those important documents.

It is not within our province to deal with all the sections of the report of 1904, and we must confine ourselves to the parts relating to construction. In the first place, Lord CROMER doubts whether another instance is to be found of a State that has devoted so large a proportion of its revenue to the construction of remunerative public works. But such were the circumstances under which the money was raised that no funds could be provided to keep the public buildings, canals and drains in order. It is expected that the outlay will bring returns; but cases arise, such as the construction of roads, lunatic asylums, prisons, drainage of towns, &c., which cannot immediately bring in a profit.

The works which are contemplated as necessary will involve a large outlay. Sir WILLIAM GARSTIN'S projects are estimated to cost £21,400,000, but will amount to a still larger sum. Ultimately the improvements may prove remunerative, but they cannot yield any return in the early stages. On the subject of public buildings Earl CROMER writes:

In spite of the fact that since 1891 no less than £1,600,000 has been spent from the reserve funds on public buildings, the legitimate demands under this head are still very numerous. The Government offices in Cairo are very inconvenient. Moreover, they were originally so badly built that new offices have become an almost inevitable necessity. The cost of maintaining the present buildings is excessive. The prisons are still overcrowded; and the provision for lunatics is so inadequate as to necessitate the discharge of many persons who should be under restraint. Another school for secondary education is much

required. An improved technical school, to take the place of that now established at Boulac, must certainly be built before long. If, as I trust will be the case, industrial education is extended, a school, modelled on that recently built in Cairo, should be erected in every large provincial town. Little or nothing has as yet been done in the way of providing proper accommodation for the village schools ("kuttabs") which are dotted all over the country. A school is required for police cadets, and the War Department has urged that more money should be spent to provide suitable barracks for the troops at Alexandria.

His Lordship believes that the progress of the country is in many directions being retarded by the want of suitable public buildings. No less important is the matter of public roads. Outside the neighbourhood of some of the principal towns there is not a single metalled road in the country. As tourists are aware, many of the streets of Cairo are in a deplorable state. In the provincial towns they are no better. £20,000 was expended last year in asphaltting some of them, and a similar sum will be laid out this year. Sanitary measures also demand a large expenditure. At present attention is directed mainly to water-supply. It is expected that before the end of 1905 pure water from new artesian wells will be delivered in Cairo. Lunatic asylums appear to be on the increase in Egypt as in Europe. A building now used as an army hospital, adjoining the asylum, is to be enlarged and arranged for lunatics. Plans have been prepared for another large asylum, but the site has not been chosen; it will probably be between Tintah and Alexandria. It is to be arranged as a villa colony, which is believed to be suited to the Egyptian climate.

The remarks on technical education reveal not only the wisdom but the kindness for the poor of his Lordship. That improvements are always accompanied by some suffering has been often exemplified in England when machinery deprives workmen of employment. Egypt being in a more primitive condition, the misfortune that follows change is more marked. The improvement of water-supply has ruined the extensive native industry of manufacturing water-skins, and has put an end to the employment of water-carrying, which in 1897 was followed by about 16,000 men. A thriving quarter of Cairo was occupied by makers of sieves. The adoption of the European system of milling has supplanted the industry. By a new law cereals have to be weighed instead of measured; there is no longer any need for makers of wooden measures, or for measurers, who numbered at least 10,000. By the modern preference for wooden floors instead of stone flooring the masonry occupation has been diminished; and so on through various other trades. In order to provide for the new conditions industrial schools have been established, and Lord CROMER hopes to see a model workshop in every important town.

When material interests are so urgent, science and art must be satisfied with partial attention. Lord CROMER seems to think that anyone who will remember that a few years ago the Treasury was almost bankrupt must allow that everything that could reasonably be expected has been done. During the last ten years £115,000 has been spent from the ordinary budget on the archaeological department. A museum has been constructed at a cost of £251,000, and about £14,000 expended on a catalogue; £12,000 has been spent at Karnak, £13,000 at Philæ, and £1,500 at Edfou, restoring and preserving the ancient monuments at those places. Within the same period the preservation of Arab and Coptic monuments has cost £82,000. A museum of Arab art, which also comprises a library, has been constructed at a cost of £58,000. The library receives an annual grant of £4,500 from the Government and of £500 from the Wakfs administration. It contains a numismatic collection. A Græco-Roman museum has been established at Alexandria costing £10,000; it is maintained by the Municipality at an annual expenditure of £1,200. A geological survey

The Architect, April 28, 1905.

Yours faithfully
Hindson

in progress and there is a geological museum. An observatory, equipped with all the most modern instruments necessary for meteorological and seismological observations, has been established at Helouan.

All the columns of the Great Hall at Karnak, which collapsed in 1899, are now rebuilt to their full height. The capitals and architraves are only to be placed on them. During the progress of the works a pit was discovered in which the architects who had restored the buildings in B.C. 300 had buried statues belonging to the temples connected with the residence of the high priest AMMON. About 500 statues have been disinterred, some being in the highest known style of Egyptian art. Their historical value is immense, and nothing equal to the discovery has been made since MARIETTE'S excavation at Serapeum.

M. MASPERO has testified that he is satisfied with the state of Philæ. The stone has hardened under the water, and consequently has more chances of endurance. There is no longer any fear of the action of salt-petre and organic matter. In a recent report Mr. HOWARD CARTER, the inspector of antiquities, says:—

"The state of Philæ as regards stability appears to be better than the general state of the temples in Egypt. The action of the water upon the stonework has been slight, and really only distinguishable when the stone is of bad quality; even then there is at present but little fear of disintegration. The deposits of salts, as well as vegetable growths, on the wall surfaces that have been submerged were certainly far less than in the former year. In many cases the stone appeared to have become harder, perhaps owing to the water replacing, or rather taking the place of, the original quarry sap, as had already been surmised in former reports. To bind the corners of the masonry with metal guards from the high-water level downwards would, I think, be a great protection against the native boats taken into the temple by visitors, as certainly more damage has been done in this way than by the water itself.

Lord CROMER considers it would be premature to discuss what further steps should be taken for the preservation of the temple until the question of raising the Assouan dam has been settled. There is no doubt the temple will have to be submerged if the dam is raised. But the archaeological and artistic must yield to the general interest of the country. His Lordship says the Government would spend more if there is reason to believe results would equal the increased cost. Suggestions will receive careful attention so long as it is not desired that the temple should be removed and rebuilt on the mainland or elsewhere.

During the past year work has been carried on at seven mosques, including the mosque of Sultan HASSAN. Mr. SOMERS CLARKE drew the attention of the Government to the bad state of repair into which the old Coptic monasteries known as El-Abyad (the White) and El-Ahmar (the Red), at Sohag, had fallen, and urged that steps should be taken to preserve them. An examination of these monuments was made, and it has been decided to restore them. The Coptic Patriarch has consented to provide £1,000 of the total sum required for this purpose, on condition that the Government finds the rest.

In the Soudan Lord CROMER and his officials have to deal with savage races, and it is a hard task to endeavour to civilise them. But the natives are willing it is an advantage to be under the control of an honest Government. One proof is seen in the increase of revenue. In 1898 it was estimated at £100,000, and in six years it has increased to over £200,000. The taxing is light and can be collected with ease. What his Lordship says about low taxation is a particular reference to this country at the present time. He describes it as the keystone of the political system. It brings general tranquillity in its train. It is an essential preliminary to steady and continuous moral and material improvement. It allows, either at once or gradually, of the adoption, without serious danger to the State, of a policy in other matters which is in

general conformity with the liberal views and traditions of the British Government and of the British nation. The Soudanese, we suppose, will soon find that as they advance in civilisation their taxes will be increased. As it is, they are becoming acquainted with some of the mysteries of circumlocutionism. Lord CROMER says he notices with a feeling akin to alarm that the Controller of Taxation remarks that the consumption of stationery still increases. Much of the correspondence, he says, is superfluous. He hopes all British officials will do their utmost to discourage this tendency, by which useless correspondence is accumulated and that which is useful is delayed.

A sum of £27,000 was spent on the construction of civil buildings. A number of mud-brick buildings had been run up to accommodate the officials and troops. They are now being replaced by permanent buildings. Captain KENNEDY, R.E., the director of works, says:—"All the building stores, such as doors, windows, girders, &c., have to be transported long distances by camel, and in many cases even fuel, wood for burning lime and bricks, has also to be so transported. This not only enormously increases the cost of building, but also ties us down very much as regards design, as we are restricted in the case of girders for roofing, &c., to loads which can be transported by camel. Till wheeled or other mechanical transport is introduced the cost of conveying heavy stores or machinery to these outstations is practically prohibitive."

Khartoum, around which there are so many tragic memories, has now a bi-weekly newspaper, steam trams, a service of Japanese rickshaws, a steam chain-ferry, and it is practically impossible to find a vacant house to let in either the second or third-class part of the town. The nomad Arabs who live in the neighbourhood and who make plenty of money as cattle-dealers, "still prefer to lead the life of the free-born sons of the desert, no matter how large their herds or how numerous their followings." In concluding his report, Lord CROMER says that the present year appeared to open under auspices of a peculiarly favourable nature for the cause of progress and reform, both for Egypt and the Soudan. All who read his pages must desire that his anticipations will be realised to the fullest.

LORD WINDSOR.

THERE was a time when a First Commissioner of Works, if he opened an exhibition relating to building, would excite surprise. In those days high officials of that rank were not selected because they were able to take an interest in architecture or construction; it seemed to be necessary that they should be disposed to regard both as if they were dangers to the Administration. Happily there is no fear of any want of appreciation on the part of the present holder of the important office, Lord WINDSOR. His Lordship, whose portrait we now publish, has not only studied art practically, but he has demonstrated his knowledge of it by his writings. To have had erected such a house as Hewell Grange, one of the noblest examples of English Renaissance, is a testimony to his skill in judging architecture. Lord WINDSOR has given an additional proof of his interest in construction by giving his patronage to the Building Exhibition, and his action will be valued by all who have contributed their specialties to the collection, as well as by the important body of manufacturers of whom they are the representatives.

In the Competition for the Lambeth Municipal Buildings no less than 144 complete sets of designs were submitted. Mr. Hare, the assessor, having completed his examination, the designs will be open to public inspection at the Lambeth Public Baths (at the corner of the Kennington and Lambeth Roads) from Monday, May 1, to Saturday, May 6 (inclusive), from 9 A.M. to 6 P.M.

CARNARVON CASTLE.

THE Constable of Carnarvon Castle, Sir John Puleston, has come to the conclusion that the adapting of the castle to the purposes of a national museum will not be disadvantageous to the building. Writing to the Mayor of Carnarvon he said:—

"Mr. Thomas called with the plans. I fully approve of them. So far from taking away the character of the castle they will, if carried out, greatly add to its great interest. The fact that only the interior of the tower is to be utilised for the museum will in no way interfere with patriotic sentiment attaching to the old historic castle, but, on the contrary, add to it. It will also have the important effect of preserving the towers, and by a much-needed restoration it will prevent further decay. While I have all along done all that was possible by way of restoration, my trouble has always been that much more was needed to preserve them, so that if, as I think, your plans are carried out, the double purpose will be attained, and I most readily concur in granting the use of the castle for the proposed national museum.

"I feel that with a site of such historic interest, and in the centre of the Celtic population of Wales, the argument in favour of Carnarvon should be irresistible, and with the museum placed there, would speedily attract innumerable objects of Welsh interest and impart to the Welsh National Museum a character which no other place would give it. The reports of the President of the Society of Architects and the Director of Museums for Liverpool are eminently satisfactory. The necessary outlay will be comparatively small, while the advantages from every point of view will be immeasurably greater, I think, than any other place can offer, though I do not at all depreciate the desire of other places to have the museum so generously offered by His Majesty's Government. I think you will speedily be able to get together the amount needed. I will be glad to facilitate here in any and every way open to me."

The committee of the Privy Council will hold the first meeting on May 13.

"SIR" PETER LEWYS, ARCHITECT.

IN a letter to the *Irish Times*, Sir Thomas Drew writes:—

It is to be hoped that the old arms taken from the historic bridge of Athlone will as a matter of course be restored to that town. The practice of dissociating any such monuments from their ancient seat of local interest and "sending them up to Dublin" is absolutely indefensible, and no pedantry of possession should stand in the way of reparation. I have known the relics in question as lying in the cellars of the Royal Irish Academy thirty years ago, and of no interest to anyone there, while to Athlone men and intelligent visitors, and the few who have known something of Sir Peter Lewys (Chancellor and Proctor of Christchurch, Dublin, architect and builder), from the rarely quaint monograph of Mr. Berry, the arms and memorial found on their ancient site would be of lively interest.

There is also to be found in the Academy's museum and elsewhere in Dublin a class of monuments which should never have been wrested from their native sites, such as pillars and ogham stones. To the ordinary museum visitor they are but deadly dull and uncouth objects of no regard there; yet these in the sunlight of their native hills and fields and historic places would be full of sentiment and speculative poetry for many a one.

There are other classes of relics which it is scarcely less impolitic to remove into museums and to dissociate from their native finding, as, for instance, there is a find from the peat bog under Christchurch, Dublin, of some antique Celtic ornamented combs and some "working models" for the Celtic ornaments traced on pieces of deer's antler, of interest to many a visitor while in Christchurch crypt. These were stolen from it, and acquired by the Royal Irish Academy for a trifle some years ago. I would be bound to say such objects find their way to some obscure drawer unlabelled, and soon unidentifiable, and if they reach in transport the Kildare Street Museum are practically unknown to the learned curator, and have passed to be nameless museum rubbish. Yet things such as these associated with their locality of find, and to be seen there, have all the interest in the world for the antiquarian anthropologist who at such a place speculates on the successive races which have occupied the Dun of Dublin or the "Brow of the Hill of the Haxels."

Again, for instance, a body like the Board of Works, with irresponsible officers and subordinates, takes pos-

session of a vested monument, such as part of the ruins of old St. Audeon's, Dublin, to renovate and "tidy it up." A considerable collection of inscribed and ornamented tiles are turned up. Left there they would add history and interest for a visitor, but Board of Works men (as has been done in my sight) in the wanton lust of "rights" and "possession," cartload all such, and remove the relics, to be soon forgotten and unidentified rubbish, and if they survive the removal of the Board of Works to Upper Merrion Street, go to some rubbish heap.

To return to the "Sir" Peter Lewys relics, if there were a difficulty about setting them back at Athlone it is in Christchurch that deposit of such monuments should be next best made, where they are so identifiable with it and the resourceful builder and cleric and restorer of Elizabeth's time. Of his history much that is human lives in its records and has been extracted in its quaint liveliness by Mr. Henry S. Berry, of the Record Office. Peter Lewys was not himself indifferent to his posthumous identity and fame, and that should be respected. When in his diary he fancied himself vastly as to his ingenuity of building which had saved the central tower from imminent destruction, he adds:—"I brought all the choristers to see the making of the foundation, and I beat them all that they might bear in remembrance the making of the work, and I bestowed on the children at the same time sterstyn" (tester).

COLOURED WOOD.

THE American Consul at Gottenborg in his report says:—The coloured-wood industry began in Italy in the seventeenth century and wood-colouring works came to Sweden during the Thirty Years War, but until quite recently the method was used on a very small scale, and a first only dry wood was coloured. Now, by the method invented by the Austrian Joseph Phister in 1901, the wood is coloured when fresh. The tree is cut while the sap is in action, and in the colouring process the dye is forced under heavy pressure into the wood and replaces the sap. Until recently the non-poisonous colours and "aniline" have been used, but those colours fade a little. Now the manufacturers can colour to a length of 13 feet. Birch, beech, alder, maple, elm and basswood are the best kinds of wood for the purpose; oak is not good on account of the tannic acid, and in spruce and pine the colour cannot be made uniform.

The wood looks best when polished and when it is given a gay colour. The prices are yet comparatively high on account of the amount of waste, but improvements may follow, and with cheaper prices and more extensive use is considered that coloured wood will give Sweden an important income. It can be used in furniture, panels and doors, also in outside work in order to avoid painting. It is especially good for fitting ships and tramcars, and also for elegant and modest furniture. During 1903 and 1904 many works for such wood have been built.

TESSERÆ.

Greek and Gothic Architects.

THE Greek architect, having no knowledge of the art of hewing immense blocks from the sides of the marble mountains around him. Some of these he laid side by side in rocky beds hollowed and levelled to receive them; then he united with clamps so as to form a foundation as massive as the rock on which he built—some immovable even to earthquakes. This was the case at Priene, Halicarnassus, Cnidus and elsewhere. Upon these he laid slabs of fine marble for his steps and pavements, and, with carefully worked blocks, he raised the walls of his cella; and the as in his sunny climate shade was the great desideratum he surrounded the cells with porticoes and colonnades. Upon the columns he placed massive architrave and corbels, tying the whole together. The frieze was generally formed of thin slabs connected together, and left on the sculptured elevation. This ornamental work was protected by a cornice, with sufficient projection to throw off the water through antefixæ placed at regular intervals, the whole being arranged according to certain laws of proportion. The architect then called in the sculptor, who began at the top of the building and worked downwards. When the sculptor had adorned the friezes, metopes, and as in the Temple of Diana at Ephesus, even the column

with figures, the painter illuminated the whole with gold, red, blue and other brilliant colours, so that when the temple was completed it was a perfect work of art. The Mediæval architect having, as a rule, smaller stones to work with, and possessing a knowledge of the capabilities of the arch, and a perfect knowledge of the proper ratio between bases of support and superincumbent weight, piled arch upon arch and pier upon pier, causing his building to spurn the earth and aspire to the skies, and so constructed lofty vaults on comparatively slender columns, and erected spires which pierced the clouds on comparatively thin walls. At Salisbury the wall of the tower is in some places not more than 3 feet thick. He, too, designed his cathedrals according to certain rules of proportion, and decorated them with painting and sculpture, so that his building was also a perfect work of art.

Decay of Building Stones.

In building stones there are two principal sources of decay—those inherent in the stone itself and those due to external circumstances. Of those causes inherent in the stone itself, we have first a want of cohesion among the particles and porosity, which, in many cases, is a direct consequence of the former. This want of proper cohesion may be due to the absence of a cementing medium, or the stone may not have been exposed to a sufficient pressure to consolidate the mass. The result is a weak stone, which, if porous, absorbs much water, and is disintegrated by frost—a most objectionable feature. Too much argillaceous matter is also unfortunate, whether it occurs in seams or distributed through the mass. When in seams we find lines of weakness owing to their better absorbing power. Thus distributed it causes brittleness and is rapidly acted upon by the weather. Iron pyrites is another and a most frequent cause of decay. If found in nodules or in large crystals its effect is not so disastrous as when in fine particles distributed through the stone. Ferrous compounds are also deleterious, as is seen in grey freestone. The effects of iron pyrites seem to be more noticeable among the limestones than any other of the building materials. Professor James Hall in a report to the Capitol Commission says:—“If magnesia be present, the sulphuric acid formed by the decomposing pyrites produces a soluble efflorescent salt, which exudes to the surface and forms white patches, which are alternately washed off and replaced, but leaving a whitened surface, probably from the presence of sulphate of lime. If the stone be calcareous, the salt formed is insoluble, and therefore produces less obvious results.” The lime from the mortar may produce a similar effect when the adjacent stone contains pyrites. The size of the constituent particles or crystals of a stone may affect its durability. This is not always the case, for we find varieties of crystalline marbles which are much superior in strength and durability to those of finer grain. A mixture of fine grains of sand with pebbles of various sizes can seldom be relied upon. The integrity of a stone depends largely upon the character of the cementing material. A clayey medium is not good, as it absorbs much water, and is injuriously acted upon by the frost. A calcareous cement dissolved by rain-water charged with carbonic-dioxide, while a silicious cement is undoubtedly the most durable, as weathering seems to have little or no effect upon silicates.

S. Sophia.

The church of S. Sophia, which Justinian began to build in Constantinople in the year 532, was not the first church of that name in the city; it was a reconstruction of an earlier church built by Constantine the Great under this name, which was burnt, together with others, in the rebellion called “Nike” against Justinian in the early part of that century. But the restored church, like some restorations of the present day, was nothing like its predecessor. Of this we have the most convincing proof in two different accounts of the building written soon after its completion by two persons who were both of them eye-witnesses of its construction, the one being Procopius, the historian and panegyrist of Justinian, who wrote the history of his wars, his acts and his buildings, and the other being an anonymous author, who in all probability had been employed in some capacity in the building itself—the one is the description of an amateur, the other that of an architect; both, however, coincide in describing the building as unique and unlike anything that had previously been constructed. The amateur describes the unusual character of this new and wonderful building in terms which, whilst they graphically portray the general effect of its novel and striking features, his senses and imagination, leave no room to doubt that

the building which he thus saw and thus described was the actual building which still exists at Constantinople. The other writer, on the contrary, occupies himself with all the detail of the structure; he records the preparation and the arrival of the material, the purchase of the necessary site, and the contrivances and expedients that were resorted to for persuading or compelling unwilling sellers to cede their land and houses—he even gives their names and callings; he deals with the practical difficulties of the construction—the composition of the mortar, the working and the preparation of the stone, the failures of the work and the remedies provided with all the technical knowledge of a professional man. Altogether these two documents are without any exception the most interesting records of the construction and completion of a building by contemporaneous writers that it is possible to examine, and when we reflect that they are the descriptions of one of the most remarkable and original buildings that the world ever produced, our interest in them becomes redoubled.

Romanising Greek Orders.

In adopting the Greek orders the Roman architect—pre-eminently a builder—displays his particular genius. The Greek columns are usually formed of drums of stone or marble, superimposed with extreme care; for the Greek considers, rightly enough, that in its function a column indicates a monolith. If the mechanical means at his disposal did not permit the quarrying, transport and raising of blocks of very great size, he compensated for the deficiency by greater finish in the execution; moreover, when the materials he employed were coarse he coated them with a fine stucco, tinted, giving, when he thought it desirable, an effect of homogeneity to what was really a combination. The Roman architect, on the other hand, works his column in a single block of stone, marble or granite. In adopting the Corinthian order, whose shaft is comparatively slighter than that of the Doric, and considerably increasing the dimensions of his column, he was naturally induced to make the shaft a monolith. The Doric column has no base, whereas the Ionic and Corinthian have one: but these bases have no square plinth; their circular torus rests immediately on the ground. Certainly no Greek would ever have dreamed of placing at the foot of a column a block with sharp corners, obstructing the passage and endangering the feet of persons entering the porticoes. Before long the Roman puts a base to the columns of all the orders adopted by him; this base has a square plinth; he requires a bed under his monolithic column; it is indispensable for the resting of the enormous block. This bed he shows; he gives it a considerable footing. He finds the Doric order too simple, too severe. The sun is less brilliant in Italy than in Attica and Sicily; he adds a moulding to the abacus of his capital; he substitutes for the fine sinkings and the sharp lintels in the neck of the Greek Doric capital a projecting astragal. In place of the Greek profile suggested in its delicate tracing by the artist's feeling—the torus whose curve cannot be geometrically defined—he puts a torus whose curve is a quarter of a circle. His architects have not leisure to study purity of line—his stone-dressers have not time for these refinements; it is less trouble to describe a quarter of a circle with the compass than to find an indescribable curve. When, in the Greek Doric order, the frieze presents a square return, the architect takes care to put a triglyph at the angle and to lessen the two intercolumniations adjacent to this angle. The Roman desires absolute symmetry—for him it is a law; all the intercolumniations are therefore made equal. The triglyphs of the Doric order are placed over the centre of the columns. This arrangement leaves a half metope, with a square return at the angles; in other words, a hollow beneath a corner. This is contrary to reason, but the requirements of symmetry have been satisfied, and the Roman often mistakes the law of symmetry for artistic feeling. The Greek admits no rules other than those of reason, but reason reflects, considers, and cannot be tried; this does not suit the legislative spirit of the Roman. By proclaiming symmetry as one of the first laws of art he saves himself endless trouble and uncertainty, for everyone understands the laws of symmetry and is apt to apply them. But observe this: the Roman who applies these laws to the forms of art, to the apparel of his building, will boldly and rationally emancipate himself from them when it becomes a question of the satisfaction of requirements—e.g. in the several arrangements and minor details of his public buildings. Here we have one of the characteristic features of Roman architecture.

NOTES AND COMMENTS.

THE Liverpool School of Architecture and Applied Arts has been generally deemed to have obtained exceptional success. But there was some demurring at the meeting of the Liverpool education committee when it was proposed to take over the school. According to one member the school had been unsuccessfully and extravagantly managed. At present, he said, there was a debt of about 500*l.* and by the end of the season this would be about 700*l.* The students only numbered 135, and the annual cost was 2,000*l.* The School of Art in Mount Street, with 357 pupils, only cost 200*l.* more. The history of the school did not justify the committee in taking over the liabilities. It was pointed out by another member that if the liability was not assumed by the education committee the responsibility would fall on individual members. It was also stated that the committee had arranged to work the School of Art with the School of Architecture and Applied Art as one institution. The proposal was adopted. Whether the new arrangement will work well remains to be seen, but it appears doubtful whether the general instruction given in an ordinary art school can be combined with the kind of exercises which are the *raison d'être* of an architectural school.

It was decided in the case of *NATHAN v. ROUSE* that where a drain carries the sewage of more than one house, and such drain being found to be defective, the sanitary authority, under Section 120 of the Public Health Act, 1891, requires the lessee of one of the houses to abate the nuisance, and the lessee of the house does upon his premises all the work necessary to abate it, he cannot recover any part of the expenses of so doing from the lessee of the other house. Lord ALVERSTONE, C.J., admitted that it might have been reasonable to impose upon all the persons using the drain an obligation to contribute towards the expense of repairing the drain if it was defective in any part, but he held that the Public Health Act had not imposed this obligation. The obligation to abate the nuisance is placed upon the person upon whose premises the nuisance arises, not upon all persons who use the drain; and the expenses must be apportioned between the owners and occupiers of property upon whose premises the work is done. This case takes us a step further than the cases upon these Acts which we have recently noticed (*The Architect*, March 3, 1905) towards the elucidation of our sanitary code.

It is generally supposed that French artists in general are not models of piety, and are not remarkable for regular attendance at religious services. But they are competent to appreciate the value of the cathedrals and churches of France, which, all things considered, are the most interesting works of their class in Europe. The proposals by which the churches may be secularised, like the Panthéon in Paris, are therefore obnoxious to many artists, and they have signed a protest which, from the names attached to it, must attract attention. Some of the provincial archæological societies have also urged the Government to be cautious in altering the arrangements which have been long accepted. It is believed, however, that the danger to the church fabrics will be far less than was anticipated when the Anti-Ecclesiastical Bill was first drafted. The buildings will not be utilised for purposes which would degrade them. The recent division in the Chamber removes the most serious danger, and it is not impossible that the churches will be still used as formerly. But a pressing question remains, and that is, how the conservation of the buildings will be secured.

THE influence of Geneva may shortly be felt in industrial art in England, as it is already in other important affairs. The Council of the West Riding of

Yorkshire some time ago requested the loan of works by the pupils of its *Ecole des Arts Industriels* in order to convince recalcitrant members about the advisability of reforms which would bring English schools of art nearer to the Geneva school. The Geneva Government graciously granted the demand. M. BICHERAT, the manager of the school, was invited to arrange the exhibits and to lecture on them before Lord LONDONDERRY and representatives of education in different parts of Great Britain. His Lordship expressed satisfaction at what he heard, as well as his desire to impart a more practical character to the classes in the English schools of art. As a first effort M. PLOJOUX, sculptor, has been given leave of absence for two weeks in order that he may start a class for moulding in Leeds. The school examples, which attracted much attention in Yorkshire, have also been exhibited in Dublin with much success. Applications have come from many other places in Great Britain, but it is feared they cannot be granted as some of the works of art might be injured during the journeying.

As was anticipated, there was some difference of opinion among the Archæological Congress at Athens respecting the restoration of the Parthenon. Those who proposed a restoration of the temple in the modern signification of the word appeared to shrink from an explanation of their schemes in open day. M. CAVADIAS, the official archæologist, was able to assure the meeting that restoration of that kind would not be tolerated either at the Parthenon or in any of the other temples. It is likely, however, that his own project, to which we referred some weeks ago, will be attempted. As we explained, M. CAVADIAS regards the debris around the temple as a mine from which much that is valuable could be extracted or extricated. It may be possible to obtain several drums which could be arranged in columns. They would not be perfect, and the gap between them would form a marked contrast to the closely set drums of the more perfect shafts. The effort would only be experimental, but under so scrupulous a director as M. CAVADIAS, something might be achieved which would increase our knowledge of the arrangements of the building.

ILLUSTRATIONS.

THE MARRIAGE AT CANA.

CHURCH OF ST. MARY HIGHWEEK, NEWTON ABBOT.

THIS church has been designed by Mr. E. SEDDING. The plate is a reproduction of a drawing in the Royal Academy.

NEWTOWN LODGE, HUNGERFORD, BERKS.

THE illustrations show the recent remodelling of what was a singularly dilapidated and uninteresting house as seen from the bend on the high road between Hungerford and Great Shefford. The house had, apparently, gradually grown from an eighteenth-century cottage of humble type. Each extension had been very carelessly carried out. Great care was required when remodelling the building to avoid interfering with the existing structure more than was absolutely necessary. The existing walls were therefore retained as far as possible. The only alterations attempted were the replacing of two bay windows by adding a third, the erection of two gables and the widening of window openings. The rough-cast and half-timbered style adopted in the architectural treatment harmonises with the surroundings and suitably maintains the simplicity and character of the house. The builder's work was executed by Mr. H. HOSKINGS, of Hungerford, now of Newbury. The engineering work necessitated by new sanitation and water-supply was carried out by the late Mr. BRIDGEMAN RUSSELL, Berwick Street, Oxford Street, W. The architects were Messrs. HUBBARD & MOORE.

PAUL VERONESE.*

ACCORDING to VOLTAIRE, the Venetian artist PAOLO CALIARI, or IL VERONESE, was a painter whose colours were brilliant, whose treatment was facile, at whose representation of costume was defective. The costume problem is one which puzzles many people when they see a painting by PAUL VERONESE. His greatest work, *The Marriage of Cana*, of which we give this week an illustration—the first, we believe, which was ever attempted in this country—is a remarkable example of his treatment. We cannot determine what VOLTAIRE meant by defects of costume, unless he referred to the congruities which are to be seen in the majority of the paintings by VERONESE. To the painter raiment was more important than the body. It was not an oversight, it was a manner of treatment that was adopted deliberately, and in excuse for which much can be said.

We can see in SHAKESPEARE sundry attempts to combine different ages as if they were not far apart. In painting that was done at an earlier time. Pictures were often votive offerings and donors wished to be represented as paying tribute to some heavenly being. The custom is found in a limited way in our time, for the portraits in stained-glass windows are no more than the survival of a practice which prevailed through the Renaissance period. In Venice it was carried to a further extent than elsewhere. The city was republican and commercial. It believed in co-operation, and a large number of people who were recognisable were boldly introduced into paintings supposed to represent Scriptural scenes. When we see the picture of TINTORET representing Venice as one of the Divinities, with the doge and senators in proud admiration, we should be thankful that the portraiture of contemporaries was not carried to a still greater length. It is always difficult to transport oneself into a past age and to attempt to understand the motives of people who were then living. If a painter were to exhibit a picture like *The Marriage of Cana* with several academicians in the foreground, his work would give rise to much amusement and sensitive people might be horrified, but we must not judge the sixteenth century by our chilling conventionalities. What Mr. RUSKIN says is true and especially applicable to the great Louvre picture, viz.:—"When you see one of TITIAN's splendidly passionate subjects, or find VERONESE making the Marriage in Cana one blaze of worldly pomp, you imagine that TITIAN must have been a sensualist and VERONESE an unbeliever. Put the idea from you at once and be assured of this for ever—it will guide you through many a labyrinth of life as well as of painting—that of an evil tree men never gather good fruit—good of any sort or kind; even good sensualism."

It must always be deplored that VASARI did not include VERONESE among his subjects. He often heard about him, and a man who was so prominent among Venetian artists could not be unknown in Florence or Rome. In one place he refers to the painter PAOLINO, a Veronese who was in good repute in Venice, where, although not more than thirty years old, he executed commendable works. He describes him as the son of a carver in stone and as having been a pupil of GIOVANNI CAROTO. Several of PAOLO's works are mentioned, among others *The Marriage of Cana* at the upper end of a very large room in the monastery of San Giorgio Maggiore, which, according to VASARI, was said to be most wonderful for grandeur, invention, number of figures—more than a hundred and fifty heads, all judiciously varied and executed with the utmost care—and variety of vestments. VASARI also relates how PAOLO was considered to have surpassed the best painters of Venice by his paintings in the library of the Doge's palace, and in testimony of his success a golden chain was placed around his neck. He concludes by saying, "As

this young man has not yet attained his thirty-second year, I will say nothing more at present about him."

A prophet is not always honoured in his own country, especially when it is favourable to the growth of the species, and it is believed that in Verona, where there were many painters, PAUL CALIARI was of little value. This may explain VASARI's indifference. One effect of it has been that the date of the artist's birth is uncertain. The year 1532 used to be given, now 1528 is preferred. He belonged apparently to a family of artists, for his father was a sculptor, his uncle a painter, as well as his brother, and three of his own sons practised the art. In his youth he helped his father, but afterwards he preferred painting, and studied with his uncle, ANTONIO BADILE, from whom he acquired the love of grand architectural backgrounds. A painter in the sixteenth century must have had little skill if he did not obtain employment in the adornment of churches. There are in St. Fermo and St. Bernardino, Verona, paintings which are ascribed to PAUL. He realised, we suppose, that the competition in his native city was excessive, and he tried his fortune in Mantua. There, if he did not gain commissions, he had leisure to study the daring works of MANTEGNA; and, as his works show, resolved to emulate the marvellous foreshortening and perspectives of that great genius. He was enabled as it were to inhale a spirit of colour in Venice which was wanting to MANTEGNA.

When VASARI speaks of PAUL VERONESE as being in his thirty-first year, the painter had then an established position among the grandees of the art which could only be secured by a series of successes. We may suppose he was not more than twenty when he left Verona. He may have had adventures if not disappointments, and it is in the absence of legends about him that we miss the postponement of a biography by the gossiping VASARI. A rambling life is favourable to decoration, for even the sign of an inn would be useless in the sixteenth century if it were not effective. The scenic paintings of VERONESE have elements which were absent from MANTEGNA and which were not likely to be taught by the masters of Verona. They are deficient in the repose which is essential if academical rules are followed, and were likely to owe their characteristics to a course of practice which was independent of the restrictions which are imposed by schools. If we knew how PAUL VERONESE lived for five or six years of his early practice, his paintings in Venice, Paris and London would be more easily understood.

This absence of academicism or indifference to stereotyped rules was probably the cause of the severity of Sir JOSHUA REYNOLDS in his judgments on PAUL VERONESE. As a new fledged academician it was, we suppose, considered necessary to show no mercy towards a painter whose name was not recorded on the roll of any Italian academy and who dared to be independent. The English students were therefore warned against the captivating splendour of the Venetian style, which originated with men who "seem to have painted with no other purpose than to be admired for their skill and expertness in the mechanism of painting." According to REYNOLDS, the only difference between PAUL VERONESE and BASSANO is that one introduced gentlemen into his pictures and the other the boors of his district as patriarchs and prophets. REYNOLDS, who generally employed only a few figures in any of his compositions, could not understand a painter who required at least fifty to express an incident. When he was compelled to praise it was grudgingly he allowed the merits of the painter, as in the following remarks on the lighting of the picture we illustrate:—

In the great composition of Paul Veronese, *The Marriage of Cana*, the figures are for the most part in half shadow; the great light is in the sky, and, indeed, the general effect of this picture, which is so striking, is no more than what we often see in landscapes, in small pictures of fairs and country feasts; but those principles of light and shadow being transferred to a large scale, to a space containing

* See Illustration.

nearly a hundred figures as large as life, and conducted to all appearance with as much facility, and with an attention as steadily fixed upon the whole together as if it were a small picture immediately under the eye, the work justly excites our admiration, the difficulty being increased as the extent is enlarged.

The world has not adopted REYNOLDS'S decisions about the Venetian painters, and especially PAUL VERONESE. As an idolater of MICHEL ANGELO he upheld form rather than colour, but in later days there has been a reduction, and many defects in proportion are tolerated if compensation can be found in attractive colouring.

In the days when PAUL VERONESE was painting, artists were indebted to the Church in more ways than obtaining commissions. When a monk rose to be a sub-prior or prior he was able to do much for one of his nephews who followed any of the arts. If he had no relatives he found substitutes for them in the sons of the companions of his early days. It is believed that it was owing to a man from Verona who had been raised to a priorship that PAUL VERONESE went to Venice. He was acquainted, no doubt, with the works of the artists who were then renowned, and he may have hesitated about entering into rivalry with them until the opportunity was given him. The monastery of St. Sebastian appears to have been a home for him during life, and his remains rest in it. He painted a *Coronation of the Blessed Virgin* which is now in the Academy of Venice, and which must have imposed a sacrifice on him, for there could be no architectural structures introduced. He also painted the history of St. SEBASTIAN, and various other scenes. The *Coronation of Esther*, which is also in the church, might have been painted in competition with MANTegna or from a design by the earlier master, so marked is the treatment of the figures. The painter's name will always be associated with that church, and it alone enables the student to realise the dramatic power of PAUL VERONESE. The pictures are not now to be taken as examples of his manipulation, for they were restored by less skilful hands. Their success when first seen must have been extraordinary. Jealousy was dominant in Venice among artists, but even the patriarch TITIAN had the generosity to acknowledge the genius of the young painter. Some years afterwards when the library was to be painted it was owing to the influence of TITIAN with the competing artists that the supremacy of VERONESE was acknowledged, as we have already mentioned.

It is impossible to tell in what order his works were executed. It is believed, however, that *The Marriage of Cana*, of which we give an illustration, was completed in 1563, when the painter would be in his thirty-fifth year. When the French conquered Italy it was among the spoils of war which were sent to Paris. In 1815 it was arranged that the picture should be returned. The Austrian officials became alarmed at the trouble in which they would be involved with a picture measuring 30 feet by 20 feet, and they accepted instead an example of CHARLES LE BRUN.

The great work excites the admiration of all who visit the Louvre, and every figure in it is as familiar to Parisian amateurs as any of the portraits in the gallery. There is a description of it as it appeared in the Refectory at Venice by the President DE BROSSES, who visited Venice in 1739. He says it not only belongs to the first class of paintings, but it is the first in that class. From the grandeur of the composition, the number of the figures and the beauty of the composition, it can be compared with *The Battle of Constantine* by RAPHAEL and GIULIO ROMANO. There may be more fire, design and science in the battle-piece, but what riches, colours, harmony of colours, varieties of stuff, and what astonishing order in the whole composition of the marriage scene. It is pointed out that the architecture, which has so much to do with the success of

the picture, was the work of BENEDETTO, the brother of PAUL. DE BROSSES refers to the figure of TITIAN in the foreground, who performs on the cello; also PAUL VERONESE, who plays on the viola, and TINTORET on violin, whilst BASSANO plays the flute. He said the painter wished in that way to express the profound science and the slow and wise execution of TITIAN. PAUL'S own satisfaction, the rapidity of TINTORET, the suavity of BASSANO. He draws attention to skill with which the painter appears to endure interruption of a man who is talking to him. The standing figure on the right holding a cup and wearing a richly embroidered robe is BENEDETTO VERONESE, architectural painter. Evidently the majority of heads are also portraits, although they are no longer to be identified. The two principal figures somehow lose their importance amidst such a crowd.

The introducing of supernumeraries became habitual with the painter, he seems at last to have looked on them as of no more importance or relation to the subject than the buildings or accessories of the background. On one occasion the liberty was carried to excess. PAUL VERONESE represented a servant who was with an accident and who was bleeding from the nose as well as mercenaries who were intoxicated. He was summoned before the Inquisition in 1573. As he was a supper scene he said that the only essential figures were those of CHRIST and the Apostles, but the practice was whenever there was any vacant space available to fill it with figures. PAUL VERONESE admitted that he had acted wrongly, but he had for precedence the works of earlier masters. In Venice the powers of the Holy Office were limited, and he escaped with a reprimand and an order to alter his work within three months at his own expense. In Spain his conduct would have met with a different sort of penalty. It will be observed that in the upper part of the illustration several figures are to be seen which we can only consider as tokens of creative power which it was difficult to control.

Venice must have suited the genius of PAUL, for on one or two occasions is there any record of him visiting any other city. He lived until 1588. He is the most scenic of painters, and he preferred to represent men as surrounded with noble architecture rather than with the adjuncts of life in the country. He was essentially a citizen and painted for citizens, and especially for Venetians.

ARCHITECTURAL ACOUSTICS.*

UNDER the general heading of Architectural Acoustics we shall have several related problems to solve, and it may be well at the outset to consider what these are. There will be,

1. The best form to give to an auditorium in order that the audience in all parts of the room may hear easily and without any confusion of sound or discrete echo. Here may be pointed out that sound being reflected and refracted similarly to light, there may be formed regions of interference and foci representing concentration of the sound waves which will materially interfere with good hearing, such points lie within the zone of the audience.

2. The arrangement of the heating, lighting and ventilation in such a way as not to interfere with the hearing in any part of the room.

3. The deadening of walls to prevent sound penetrating beyond the audience chamber. In this connection would also be included the location of pipes, ventilating shafts, &c.

4. The control of the acoustics of any audience-room so that

- (i.) The sound shall be sufficiently loud to be heard easily in any part of the room.

- (ii.) That the components of a complex tone maintain their proper relative intensities.

* A paper read at the annual meeting of the Ontario Association of Architects by Mr. G. R. Anderson, lecturer in physics at the School of Practical Science, Toronto, and published in the *Canadian Architect*.

iii.) That the separate syllables be heard distinct from one another. . . .

iv.) In the case of music, that there may be sufficient enunciation of tone to prevent the music from appearing muffled or oppressed.

Apropos of this last condition, it may be pointed out that in a hall destined for public speaking the reverberation should be as nearly as possible eliminated, and that the desirable duration may be different for different forms of music, so that a knowledge of the purpose for which the auditorium is mainly intended is necessary.

Sound, being a form of energy, when once started will continue until it is either absorbed or transmitted by the furniture and boundary walls of the room. Scarcely any one can have failed to notice how a sound is prolonged in an empty hall or church, and how much more quickly it dies away in the presence of an audience. This continuance of sound after the source has ceased will be called reverberation, and is a measure of the duration of what may appropriately be called residual sound.

This paper will deal with the question of obtaining such a result as may enable the architect to secure any required reverberation depending on the purpose for which the auditorium is intended. The solution of the problem will then be to determine the absorbing power of the various materials used in construction, and of the audience, and then to so apportion them as to reach the desired result.

Lecture Room, Fogg Museum.

Fig. 1.

To measure the absorbing power of any room it will be sufficient to measure what is inversely proportional to it, the rate of decay of the residual sound. For this purpose we require a sound and constant intensity and a device to measure with accuracy the reverberation after the source has ceased to speak.

The apparatus here exhibited consists, as you see, of an organ-pipe of pitch C-517, mounted on a wind chest and operated electrically. This is in series with a specially designed torsion chronograph, so that the drum on which the records are made is held in its initial position so long as the pipe is sounding, but is released the instant the pipe stops. A second electric key serves to operate a pencil which makes a record on the moving drum at the instant the operator decides the sound has become inaudible. Then, knowing the period of the drum, we can readily determine the exact duration of audibility of the residual sound. The method of solution will be best understood by the study of concrete examples.

We may lay down the following preliminary propositions:—

1. The duration of audibility of residual sound is practically the same in all parts of an audience-room.
 2. The duration of audibility is independent of the position of the source.
 3. The efficiency of an absorbent in reducing the duration of audibility is ordinarily independent of its position.
- These propositions which are readily verified by experiment are *a priori* evident when we consider that in a room of even fairly large dimensions the time taken by the sound to distribute itself is very small, the velocity of transmission being about 1,100 feet per second.

If a room could be constructed whose walls were perfectly reflecting, the sound once started would continue indefinitely, and to measure the absorption of any material we would merely have to introduce a certain quantity of it and measure the duration of the residual sound, and so calculate the absorbing power directly. But such a room is not possible, and therefore we are driven to calculate the absorption of any material by a process of elimination.

We will consider the lecture-room of the Fogg Museum at Cambridge, having a seating capacity of about 500, the volume being 2,740 cubic metres. In this room there were introduced by degrees a number of elastic felt cushions, the duration of the residual sound being measured from time to time, the results of which are indicated in the annexed table:—

Area of Absorbent.		Duration of Residual Sound.
Cushions.	Open Windows.	
0	0	5.61
5.2	4.2	5.33
11.	8.8	4.94
18.2	14.6	4.94
28.6	22.9	4.21
41.	32.8	3.94
54.	43.2	3.49
67.6	54.1	3.33
83.2	66.6	3.
94.2	75.4	2.85
105.3	84.2	2.64
122.8	98.2	2.36
138.4	110.7	2.33
157.3	125.8	2.22

In order to render these results universally serviceable we must adopt some standard absorbent, and for this purpose an open window is at once the most easily available one and is practically absolute. A comparison of the absorption of the cushions with that of an equal area of open window gave as the coefficient of absorption of the cushions in question 8. If now we plot these results on a system of rectangular co-ordinates, we obtain this curve (fig. 1), which from the fact that it is evidently tangent to the horizontal axis suggests a rectangular hyperbola. To exhibit such a curve in full we shall have to shift the vertical axis to the left, as shown in this second figure (fig. 2), where the curve is symmetrical with regard to the axes. Here the full line represents the absorption due to the cushion or open windows, while the dotted line is evidently that due to the walls of the room. The formula for this curve is $(a-x)t=k$ a const, a representing the fixed absorption of the walls, and x that of the added absorbents, either cushions or open windows.

Solving this equation from the given data we have
 $a=94$ square metres of cushions,
 75 " " " " open window.

That is the total absorbing power of the walls, floor, ceiling and furniture of this room—75 square metres of open windows.

Having thus obtained the total absorbing power of a room, the next thing is to apportion that absorption among the various surfaces. For this purpose we shall require observations on as many rooms as there are different substances in order to secure enough independent equations to

effect a complete solution. The following example of four small rooms will illustrate the method:—

Room.	Area of Absorbents.		Brick and Cement.	Total Absorption.
	Hard Pine.	Glass.		
1	127	7	0	8.37
2	84.8	6	30	5.14
3	12.7	80	85	4.64
4	2.1	0	124	3.08

Coefficients of absorption .058 .024 .023

To find the value of the constant K we may substitute in the equation $(a+x)/t = K$ any of the values already given—e.g. $(75+83.2)/3 = K$, which gives $K=474$ for this particular set of experiments.

In order to get at the physical significance of this constant K we will consider it in connection with a number of different sets of observations.

Room.	Volume=V.	Absorp's=a.	K	K/V
1	99	8.08	15.4	.155
2	1480	34.5	243	.164
3	1960	101	345	.176
4	2740	75	474	.170
mean			.166	

Here K is approximately equal to .166 V. That K should be proportional to the volume of the room may be inferred from the following considerations:—The absorption of the walls, &c. (a) is proportional to their area, that is, to the squares of the linear dimensions, and the duration of the residual sound (t) is inversely proportional to the number of reflections of the sound; that is, it is directly proportional to the linear dimensions, and consequently K, which is proportional to the product of (a) and (t), is obviously proportional to the cubes of the linear dimensions, i.e. to the volume.

It is evident that K will also depend on the initial intensity of the sound, but the consideration of this point may well be omitted from this already long paper; and, furthermore, so long as the intensity is constant, its absolute value is not material to our results. In all these experiments the initial intensity was approximately 1,000,000 times that of minimum audibility.

We will now give some data derived from these experiments:—

Substances.	Co-efficient of Absorption.
Hard pine sheathing	.058
Glass	.024
Brick set in cement	.023
Plaster on wood lath	.034
Plaster on wire lath	.033
Plaster on tile	.025
Ash settees, per seat	.007
Bent wood chairs	.008
Upholstered settees, per seat	.28
Upholstered chairs (hair and leather)	.30
Hair cushions, per seat	.21
Elastic felt cushions	.20
Oil-paintings (including frames)	.28
House plants (per cubic metre)	.11
Carpet rugs	.20
Oriental rugs (heavy)	.29
Cheese cloth	.02
Cretonne	.15
Shelia curtains	.23
Linoleum	.12
Audience, per person	.44
Isolated man	.48
Isolated woman	.54

To illustrate the practical application of the foregoing principles we will consider the result arrived at in the construction of the Boston Symphony Hall:—

Absorbents.	Area in Sq. M.	Coeff'ts. of Ab.	Total Ab.
Plaster on lath	1040	.034	35
Plaster on tile	1830	.025	46
Glass	22	.024	.5
Wood	625	.06	37.5
Audience	2570	.44	1135
Orchestra	80	.48	38
			1292

Volume = 18300 cubic metres

K = 18300 X .164

= 30012

t = $\frac{30012}{1292}$ = 2.32 seconds

The figure arrived at was decided upon from the consideration of two buildings, the old Boston Music Hall and

the Leipzig Gewandhaus, the former having a capacity of 2,391 and a reverberation of 2.44 seconds, the latter a seating capacity of 1,517 and a reverberation of 2.3 seconds.

For the data used throughout this paper I am indebted to Professor Sabine, of Harvard University.

MONUMENTS IN YORK MINSTER

A LECTURE was recently delivered by the Dean of (Dr. Purey-Cust) on "Minster Monuments." He explained, says the *Yorkshire Herald*, that intramural monuments in churches might be comprised under three classes: incised slabs of stone or marble, with or without plate brass, in the flooring; tablets on the walls; and effigies with or without canopies, in the aisles. Of the first there only a scanty remnant is left of those which once covered the floors of the Minster. No doubt as time went on they would become dilapidated by the tread of human feet, it was not a matter of surprise to find that in 1645 an order was issued that all the loose brass in the Minster was to be sold. The only existing survivor to this ruthless decree is one to Master John Moore, barrister-at-law, who was buried in the lady chapel in 1547, which was ignominiously fashioned into a weathercock and affixed to the turret which had lately been built on the lantern tower, and which was demolished in 1803. He gave an instance in which the gravestones in the old churchyard of St. Wilfrid's Church, which, Drake says, stood in Blake Street, were used to pave the oven of the house which Dr. Winteringham built now the judges' lodgings, and that (according to Drake) when well-baked bread was removed from the oven "the jacet" was found impressed upon the bottom of the loaf. Lord Burlington, who built the assembly-rooms and the mansion-house in the eighteenth century, turned his attention to the dilapidated condition of the flooring of the Minster, and replaced it with another on dwarf walls, to the detriment of the bases of the columns, though to the comfort of the congregation. His Lordship employed Mr. Kent as architect, and devised "a great mosaic work, thought properest for a Gothic church in which the effigies of marble gravestones of the church are wrought up," and the names and dates of those who rest beneath them, but for the good offices of Mr. Torre, obliterated for ever. It was most sad to scan the long list of ancient worthies who, church or city, discharged their appointed part, and craved that at last their mortal bodies should rest and their names be remembered within the great Minster which they loved so well, and then to trace in the varied bands of stone and Frosterley marble, often studded with the fragments of the metal pins which had affixed the brazen plates and ornaments to their gravestones, the scanty residue of all that had been devised with so much care to do honour to the last resting-place and to the House of God. All, however, has been ruthlessly swept away, and time and dirt have now effaced the elaborate pattern which we can see in Drake, and which was carefully designed to take the place. The damage done by the great fire of 1829 was dealt with, and the few slabs remaining in the north and south aisles were mentioned, with some interesting details connected with them and the families whose dead they commemorate. Amongst them is one to the memory of Jan Young, her son and daughter-in-law. She was the widow of Archbishop Young, who dismantled and stripped the archiepiscopal palace which stood in the Minster Park, which must have been a very stately building with a long arcade, of which only a fragment remains. In the lady chapel is a stone recording the name of George Aislaby, the Registrar of the Spiritual Court at York, who was killed in a duel on January 10, 1674. The duel was fought in a close of land called Penley Croft, outside Monk-Bar. Amongst many other incised stones mentioned by Torre are three connected with the Great Council of the North, established in 1557 by Henry VIII., which was a sort of protection to the Border and which existed until the time of Charles I., by whom it was suppressed. A résumé of the history of the Council's connection with York was given, and the three members whose names are commemorated on the brass were Randolph Hursthouse, Henry Check and Thomas Eyenes. The latter built the stately house still standing at Heslington, where he lived in great luxury with his wife Elizabeth, whose memorial tablet is now on the south wall of the lady chapel. This is one of the brasses which has escaped the ruthless destruction earlier by the Dean.

The next subjects dealt with by the Dean were the tombs raised above the floor, intended originally, he supposed, to represent the bier on which the mortal body had been laid. Of these there were four. One has never had any inscription, one from which the inscription has been erased, and one on which it remains. The first tomb was that of Richard Scrope, a scion of the branch of the family of Massam; the second that of Thomas Scot, of Rotherham, a scion of the family of Baliol; the third is the tomb of the Countess of Cumberland, daughter of the great Cecil, Earl of Salisbury, of which the top slab only remains. She was the wife of Henry, fifth and last Earl of Clifford, whose ancestor as castellan to the Conqueror built Clifford's Tower. The effigies on the tombs were next dealt with and explained, the oldest of which without canopies still existing is the quaint figure of Thomas Haxey, treasurer of York Minster, 1418, and architect of the recasing of the easternmost face of the north-west pier of the great tower, next to which his effigy lies. Three without canopies were modern and were described as worthy of the building in which they are placed. They are to the memory of Dr. Beckwith, Archbishop Harcourt and Archbishop Musgrave. Of the recumbent figures with canopies the earliest is that of Walter de Gray in the south transept, and is a relic of the twelfth century. The others were named by the Dean with interesting historical facts given relating to each. In the north choir aisle there was, he said, the most elegant and touching of these canopied memories, indeed, he believed that he might say that it was unique, for he knew no other like it. It is the monument of Prince William, second son of Edward III. and Queen Philippa, who were married in the Minster. Two canopied tombs have been added during the last few years, well worthy in design and execution to take their places with the best specimens of Mediæval times. In the north-eastern corner of the south transept there is a really beautiful cenotaph to the memory of the late Dean Duncombe. In general outline it is similar to that of Walter Gray, but the treatment is of a rich character, statuettes of saints being introduced with much effect on the canopy, and three of the choir boys, in whom he had taken such kind interest, represented as kneeling at his feet. The monument itself is by the late Mr. Street, the recumbent effigy by Boehm, and is said to be a marvellous likeness of the good Dean after death. Truly he deserves to be commemorated near Walter Gray, for if he built the transept it was the late Dean who accomplished its restoration at an outlay of 20,000*l*. The other modern canopied monument, though differently treated and of much later date in style, is a very beautiful design by Mr. Bodley. The canopy, which is very rich in detail, is composed of clunch, as it is called, a stone procured from Totternhoe, in Bedfordshire, and beneath it the recumbent figure of the late Archbishop Thomson rests arrayed in episcopal vestments, with a favourite dog at the feet. The likeness and expression of the face are excellent, and expressive at once of his strong intellectual character in life and his peace in death.

The Dean also spoke of a succession of six archbishops whose memorials were remarkable for two new methods of treatment, first of the figure itself, and secondly, of the ornamentation accorded to it, which was in the form of entablature at the back, no longer of a canopy over the effigy itself. The memorials are those of Frewin, Matthew Iulton, Richard Sterne, John Sharpe and John Dolben. The entablature behind them was no longer of the Gothic, but rather of the Renaissance school, the design and details being strictly Classic. Another thing to be noticed was the introduction of exuberant epitaphs in Latin, though, in consequence of the fire, not all of them had survived. Particulars were given of the six archbishops, and many other tombs were described, amongst them being those of William, second Earl Strafford, Rockingham, and Sir George Savile. The two monuments on which are emblematical figures were also described. One on the south side of the lady chapel is a draped female figure in marble by Westmacott, holding a cross of wood, and the other on the north side consisting of a somewhat ungainly female form arrayed in a loose garment with a multiplicity of folds, at the base being two small lions. The effigies of kneeling figures and the monuments of upper portions of figures were dealt with at length, and the many beautiful military tablets were briefly and eloquently alluded to. In conclusion, the Dean said:—"Who can contemplate unmoved the tablet to the truly courageous Frederick Vyner; not, indeed, a soldier of the Crown, but a veritable soldier of the Cross, who, to save another life, freely surrendered himself as a hostage in his place, to the

savage brigands of Greece, and fell a victim to their relentless fury and malice? And, finally, who can without emotion pass by the tablet to the late Duke of Clarence? A simple memorial enough. Merely the coronet which has encircled the helmet of the noble knight, with a small cross as a token of the faith in which he rests, hitched upon the wall of the church where he was wont to worship, together with two sprays of bay leaves significant of our regret that his life, so full of promise for the nation at large and so dear to ourselves, was thus early cut off."

THE CURVE IN STREET ARCHITECTURE.*

A GEOMETRICAL definition says that a straight line is the shortest distance between two points. So that any one who makes a road or other surface for traffic between two points usually lays it out between straight lines, or as near an approximation to them as he can get. Where there are many surfaces for traffic within a limited area, as in a town, the advantages of a straight line are increased; saving of time in travel becomes multiplied by the number of those who travel, whether pedestrians, horses or street cars; the system of interwoven lines becomes simpler and the spaces between them more useful and tractable; dimensions, angles and areas are easier to calculate and record, and drainage, sewage and other practical problems are simpler to solve. As an artistic motive in surfaces for traffic when properly treated the value of the straight line has been understooped since the beginning of architecture, and it is as plainly seen in the Hypostyle Hall at Karnak as in the streets of Paris or the avenues of Schönbrunn.

For all that, as a motive for surfaces of traffic the straight line is very much in the minority; cow tracks, country roads and paths in suburban gardens generally revel in every kind of curvature, and, in the Old World, streets follow their example. In every one of these we can trace to a greater or less degree artistic possibilities of a kind not to be found in the straight line. Lines of beauty do, or ought to, move in every park road or garden path that is not straight. A mere street curb is able to express a sweep of line that is living and dignified and a real pleasure to every one who can see it as it is. The really superb effect that can be produced by the foreshortened lines of common macadam is to be seen in any well-laid-out park in Europe, but particularly in France. The lines on the driveways in the Bois de Boulogne, for instance, have a grace and vigour and motion that will be a novel delight to any one who will go and discover them, and the simple borders of box or ivy along the entrance drive or path of a Parisian suburban lot have a grace that would be striking in itself without the laurels and aucubas they enclose. When a river winding through a town has its reaches fortified and accented by stone embankments, the sweep of line and surface of massive masonry is often a thing no less than magnificent, as most of those will agree who have seen the Arno at Pisa, the Tiber at Rome, or the Thames at London. The gentle reader is advised when next he takes a train to mark the superb sweep of the parallel tracts round a curve, and though they are nothing but segments of circles, he will see them foreshortened into ellipses, and acquire what Nero offered riches for—a new source of pleasure. Unfortunately, he will acquire also a new source of pain, for he will learn to feel discomfort when he sees lines on the ground, that should be curves, wrenched into kinks, or badly drawn, or in anyway spoiled or lost altogether.

So the straight line is not by any means the only source of beauty in country roads or city boulevards. It has its practical disadvantages besides, for it is often not for purposes of actual utility by any means the shortest distance between two points. This has been known from time immemorial by all sorts of practical people; from the cow who prefers a spiral track up a hill to a direct track that is not half the length, to the railroad engineer who builds a horseshoe curve in the hollow of a mountain. In fact, when it comes to laying down lines of traffic the straight line is only the shortest when it does not entail a losing struggle with the laws of gravity. What this means needs but a little figuring to show. If it takes a certain force to overcome a certain grade, it would, if other things were equal, take twice as much to overcome a grade of twice the steepness, because the weight has to be raised

* From an article by Mr. H. A. Caparn in the *New York Architectural Record*.

through twice the height. It is found that if a horse can draw 1,000 lbs. on a level he can only draw 970 lbs. on a grade of 1 per cent., 550 lbs. on a grade of 5 per cent., and only 100 lbs. on a grade of 10 per cent. The resistance to the tractive power of a locomotive due to gravity alone is 2 lbs. for every ton of the train on a grade of 1-10th per cent., and 32 lbs. per ton on a grade of 1.6 per cent. Such figures as these will give an idea of the power expended in every street of the town merely to overcome the unceasing resistance of gravity by pedestrians, horses and street cars, all of which can be expressed in foot-pounds of the strength of men and animals and coal. If the power thus used up on streets like Amsterdam Avenue, New York City, could be saved it would be worth millions of dollars annually, and add so much in wealth and energy and comfort to the community to be expended in profitable directions. Apart from the saving of energy, it will often take actually less time to trot or steam at full speed along a roundabout but easy course than to climb on foot or wheels slowly and laboriously up a short but steep one. Besides, buildings along a steep street are more difficult to plan and expensive to build, and the back yards must either remain sloping and lose part of their usefulness or be raised into levelness and practicability by terrace banks or retaining walls, all which means further expense and loss of space. Thus, for practical purposes, for economy of strength of men and animals or power of machinery, and even of time, for convenience and economy of planning of buildings and utilisation of space, the straight line is often anything but the shortest distance between two points.

Somewhere in the earth, ever since men have made structures to house themselves or their dead, or their ideas of a deity, the curved mass of masonry—usually taking the simplest form of a circle or part of one—has found expression, either growing out of practical needs of material or uses, like the piles of the mound-builders, the Indian totes, the amphitheatres, the Coliseums or the Albert Halls, or the circular meeting-places of radiating streets like those in Washington or the Place de l'Etoile in Paris, or made wholly or in part for their own sake, like the Temple of Vesta, the colonnade of St. Peter's or the apse of a Gothic cathedral. Never a building age but has, in one way or another, felt and submitted to the fascination of the line that always changes, that presents successions of innumerable columns or windows, or even mere unbroken surfaces at different angles, each with its own variety of light and shade, yet all in graded order and gaining from the foreshortening of a number of equal things the variety of a series of unequal ones, changing successively in exact proportion. Every pillar in Bernini's colonnade, and every exterior stone in the Castle of St. Angelo has a presentation, an individuality and a distinction that it could not acquire in a structure of rectilinear plan. Never a Mr. Howson Lott who devises a path of superfluous wriggles up to his front door, and aggravates his indirectness by the latest and rigidest kind of cement pavement, but feels strongly, if illogically, the charm of the foreshortened curve, so pleasing to the eye and so exhilarating to travel along. No one of artistic feeling or performance who does not delight in the eternal and indispensable curve of the sky or the cathedral dome, of household utensils or decorative detail, whether of the surface of a vase or the stupendous ellipse of a planet's course. People go out of their way to make curves in anything, from an argument to a garden walk, from the plan of a church to some new distortion of the feminine form divine. And perhaps all this groping after the curve is less mad than methodical, a yearning for something eternal and essential. Is there such a thing as a straight line, after all? The straightest-looking lines are those which are really curved. A column must have an entasis or it appears concave, and a long wall or step must rise in the middle lest it seem to sag, and the Parthenon, exemplar of severe verticalness and horizontality, had not a straight line in it. The parallel beams of the sun at sunset appear to spread towards the zenith and converge to the opposite horizon; the lines of a street, eaves, windows and curbstones rise and fall to their vanishing points whichever way one turns. The plane-appearing superficies of the sea is round, and so is the right line of the horizon. The fact is there is no such thing as a straight line. They are all merely phenomena, apparitions, not realities, tiny segments of vast circumferences serving for our small and temporary uses. The more sides a regular polygon has the nearer it approaches a circle, and when the number of sides becomes infinitely great and their dimensions infinitely small our polygon

becomes a circle. Thus every straight line on the earth every tangent at the end of one of its radii, is but another contribution to its general roundness, and the gigantic part of the sun's light to one of its planets is but an infinitesimal part of an infinite circle of the universe.

Yet with all this instinctive search for the bending line its use in and out of season, building designers seem often loth to use it, particularly on a large scale; or perhaps does not occur to them. There was, for instance, a nob opportunity for a sweep of columns or arches or other architectural motive lost at St. Louis, where the transverse avenue between the principal groups of buildings would naturally be a circle struck from the centre of the great fountain; but the obvious and opportune curve is broken into six straight lines and four angles, two of them re-entering and all more or less difficult and thankless to treat. The bridges of Paris and Rome rise to an angle in the middle instead of the more graceful and convenient curve of those in London. Compare the splendid sweep of the Arno embankment at Pisa with the ugly angles on Franz Josef's Quai at Vienna. How much more restful and pleasing would have been these lines of buildings, curbs and car-track, had they been reduced to one great segment of a circle. A railroad engineer is compelled to make a curve at every change of direction, as a train will not travel along a kink; but the city engineer, or whoever plans new roads or streets, never uses a curve that can be avoided if it is troublesome to lay out on the ground and record in the office. So our towns are disfigured by endless succession of streets meeting at awkward angles in road surface and building line. If we wish to see a street of graceful line that is not straight we must usually go to the Old World where they have grown up everywhere along ancient farm roads or sheep paths. The character of such a street is entirely different from that of a straight one. The side bend round a corner and disappear from view, provoking the never-fading curiosity to discover what is beyond. The façades of the buildings are presented at different angles and on one side to greater advantage than where they are all in the same plane. How much of its charm does the Grand Canal at Venice owe to its windings and how much would some of the palaces lose were they to be marshalled along their watery highway straightened out, until one could see from the railway station to the ducal palace? How much of the fascination do so many country towns of Italy or England owe to the curvature of their streets? Look, for instance, at the Via Serbelloni at Bellagio, where the houses have obviously strung themselves along the track of farm waggons rotted away, maybe, these thousands of years, by which took the easiest route uphill. What a charm do those long-forgotten feet or wheels lend to the irregular course they unthinkingly marked out. Look at the street seen through the ancient gateway of Bologna. The long buried Strada dell' Abbondanza at Pompeii so nearly approaches the superb in the sweep of its lines and the regularity of its massive piers that it is hard to believe that it was not designed and constructed for the effect; such a highway ought to have. They seem to have understood the value of equal spacing and continuous cornices on a curve in England better than on the Continent; they have found the conditions there, and gladly accepted them for a motive. There is the famous example of Regent Circle in London, or the Crescent at Bath, where the resultant effect is very striking in its logic and order. In the West End of London are many curved streets of houses of similar and commonplace design, yet looking very handsome and dignified with their unbroken horizontal lines and repetition of vertical ones. In the same way, and on a very large and complete scale, the circle is used in the Piazza Castello at Milan. These curved streets separate themselves into two classes: the monumental or conscious and deliberate (which is comparatively uncommon), and the accidental or picturesque which is found in almost every town in Europe and many at home. All travellers see, and most travellers admit, that they are more or less, consciously or unconsciously, for the most part, full of charm and artistic suggestion. Yet, though every traveller with half an eye for the picturesque has felt this fascination, though they have been sketched, and painted, and engraved, and oleographed, though irresponsible Cook tourists have snapped them with portable kodaks and serious professionals have photographed them with clunk-box cameras, it does not seem to have occurred to any one in this country at least, to take them for a motive of design, to deliberately and aforethought make something of the same kind where circumstances permit and encourage

RECENT DISCOVERIES IN EGYPT.

A CORRESPONDENT of the *Manchester Guardian* says:—

Dr. Neville and Mr. H. R. Hall, at Deir-el-Bahari, have unearthed fine statues of Usertsen II., of which two will probably be shown at the Egyptian Exploration Fund's exhibition (University College) of the season's work in July next. All these statues are in more or less perfect condition. They also were fortunate enough to find on the platform of the eleventh dynasty temple a sarcophagus in white marble, made for the use of the Princess Kaa of the same period, which for beauty of workmanship and perfection of condition is said to excel even Belzoni's sarcophagus of Seti in the Soane Museum. This will probably be kept for the Cairo Museum. Another find of theirs shows Neb-kheru-ra's wife to have been an Egyptian.

Great importance is attached to the recent discoveries made in the Biban-el-Molouk at Luxor. Mr. T. M. Davis, a rich American, has been in the habit of wintering in Egypt for many years. At first he came as a tourist, but some thirteen years ago he became an enthusiastic Egyptologist, and subsequently undertook important excavations. His most important discovery occurred a month ago, when, in the Valley of the Tombs of the Kings, he found the tomb of a daughter of Amenhotep III., and of the father and mother—Iuaa and Thuaa—of his famous queen Thi.

For the last nine years the Egyptian service of antiquities has been engaged upon some very important works with a view to the partial restoration of the great Temple of Amen at Karnak. The director of the works, M. Legrain, during the course of his researches came upon a pit which had been filled with statues and monuments of all kinds, mostly belonging to the Ptolemaic epoch; thence he has exhumed, up to the present time, eight thousand statues in gilded bronze and more than five hundred in granite, basalt, beryl, limestone, petrified wood, ivory, &c. No less than six hundred of the statues represent Egyptian kings—commencing with Usertsen III. (about 2400 B.C.)—and it is thought this find will elucidate many obscure points of history. Among other objects discovered, apart from statues, are ten sphinxes of granite, alabaster and limestone, images of sacred animals, steles, vases, altars, obelisks and jewels.

ARCHÆOLOGY IN HAMPSHIRE.

AT the twentieth annual meeting of the Hampshire Field Club and Archæological Society, held at the Castle of Winchester, the following annual report was read:—

The committee have, in the first place, to refer to the serious losses the Hampshire Field Club and Archæological Society have sustained during the past year. The late Earl of Northbrook, Lord Lieutenant of the county, was for many years an honoured member of the club, and continued so until his death. For the accustomed two years he served as President, and while holding office entertained the members at his seat at Stratton. His Lordship took an active interest in everything relating to the county, and the objects of the Club, as well as archæological matters generally, occupied no small share of his attention. Mr. J. Blount Thomas, who filled the office of hon. financial secretary, died on July 11 last. Mr. Thomas was associated with the Club from its foundation, and in its earlier years when more time was at his disposal and his health better, he was more active in the duties of his office, and a frequent attendant at the meetings. To the last he took a warm interest in the Club, and the members have to regret the loss of an old friend and a practical scientist of no mean order. On January 15 of the present year a severe loss, in some respects quite irreparable, was occasioned by the sudden death of Mr. T. W. Shore, F.G.S., virtually the founder of the Club, and from the first its genial and accomplished organising secretary. It would be out of place to do more than briefly allude to the loss the Club has thus experienced. To do justice to the life work of Mr. Shore and all that he has been to the Hampshire Field Club and Archæological Society demands a special notice, and this, it is hoped, will appear in due course from the pen of the Rev. G. W. Minns, F.S.A., to accompany the publication by the Club of a memorial volume of Hampshire collectanea from the writings of Mr. Shore. Meanwhile, the committee have decided to enrol Dr. Lewis Erle Shore, Fellow of St. John's College, Cambridge, as a permanent honorary member of the Club, and this meeting will readily accord an appreciative expression of sympathy with the family of the late much

valued and highly respected hon. organising secretary. In the autumn of last year there also passed away one of the oldest members of the Club, Mr. A. H. Skelton, whose wide and thorough acquaintance with numismatology was of immense service. Up to a within a few years back he regularly attended the meetings, when his health failed. He wished to resign his membership, but this the committee would not allow, and up to within a week of his death he was still at his old task of identifying Roman coins. His loss in this particular branch of study will be greatly felt.

The post of honorary treasurer has been vacated by the resignation of Mr. Morris Miles, one of the earliest members, and who has efficiently discharged the duties of the office since the formation of the Club. Those losses and changes, while greater and more numerous than any yet experienced, are necessarily incidental to the Society, which is entering on the twenty-first year of its existence. The committee have given their best attention to the contingencies which have arisen, and some proposals will be submitted for adoption by the annual meeting with a view to facilitate the official duties in future. With the cordial and active co-operation of the local secretaries and the support of literary contributors, it is hoped that the character of the Club will be maintained and the interest and pleasure of the meetings will be undiminished.

It remains only to add that during 1904 nine meetings were held, all of them successfully carried through and well attended. They were as follow:—In Southampton, on April 19; in the Isle of Wight, on April 27; at Ellingham, Fordingbridge and Breamore, on May 19; at Compton, Otterbourne and Owslebury, on June 7; at Longparish, Harewood Forest and Andover, on June 28; at Ringwood, Sopley and Christchurch, on July 19; at Carisbrooke and Parkhurst Forest, on August 31; at Southampton, on September 13, in connection with the Exhibition of Relics of Old Southampton; and at East Tytherley, Broughton and Kings Somborne, on September 20. At the meeting last named the members were kindly entertained at tea by the vicar of Kings Somborne, the Rev. J. H. D. Creighton.

The balance sheet showed receipts amounting to 240*l.* 1*s.* 7*d.*, of which 153*l.* 12*s.* 5*d.* was balance brought forward and 84*l.* 15*s.* represented subscriptions. The balance at the bank and with the secretary was 144*l.* 9*s.* 4*d.*

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of this Institute was held on the 18th inst., Mr. John Keppie, president, in the chair. The Secretary read the thirty-seventh annual report, which stated that the number on the honorary roll of members and the number on the ordinary roll was seventy-one. Appreciation is expressed of the new course of study for students of architecture, to be followed jointly in the School of Art and the Technical College, under the general direction in both institutions of M. Eugène Bourdon, which has been inaugurated during the past year. Much and permanent good, it is believed, will thereby result to the coming generation of architects in the city and neighbourhood, and the Institute feels that its thanks are due especially to those of its members on the governing bodies of both the School of Art and Technical College who have devoted much time and thought to the negotiations required to bring about, with such promising results, the joint course now entered upon. It was resolved to give the Institute prizes in future as follows:—3*l.* 3*s.* for the best general work and attendance; 2*l.* 2*s.* for the best work in measuring class, Technical College; 2*l.* 2*s.* for the best work in drawing class of School of Art. The tenth triennial competition for the Alexander Thomson travelling studentship will be held this year, and drawings are to be lodged with the Secretary by December 28, 1905. The report was adopted and the Council for the ensuing year was elected as follows:—Messrs. A. N. Paterson, John Keppie, Horatio K. Bromhead, James Lindsay, T. L. Watson, James M. Moffat, Alexander M'Gibbon, A. Balfour, Charles Gourlay, Thomas Baird, jun., R. D. Sandilands, James K. Hunter, J. M. Crawford, George Bell, Alexander Skirving and David Barclay. The treasurer's accounts, which were submitted and approved of, showed that the funds were in a satisfactory position. A meeting of the newly elected Council followed, at which office-bearers for the year were appointed, viz.:—President, Mr. John Keppie; vice-president, Mr. James M. Monro; auditor, Mr. David Barclay; secretary and treasurer, Mr. C. J. MacLean. The various committees for the year were also appointed.

THE INSTITUTION OF CIVIL ENGINEERS.

At the annual meeting of the Institution of Civil Engineers, Sir Guilford Molesworth, president, in the chair, the result of the ballot for the election of officers was declared as follows:—President, Sir Alexander Binnie; vice-presidents, Dr. Alexander B. W. Kennedy, Mr. W. R. Galbraith, Mr. William Matthews, C.M.G., and Sir Leader Williams; other members of Council, Colonel W. P. Anderson (Ottawa, Canada), Mr. C. Napier Bell (Wellington, New Zealand), Mr. B. Hall Blyth, Mr. C. A. Brereton, Mr. R. Elliott-Cooper, Colonel R. E. B. Crompton, C.B., Mr. W. J. Cudworth, Dr. G. F. Deacon, Dr. F. Elgar, Mr. Maurice Fitzmaurice, C.M.G., Mr. R. A. Hadfield, Mr. G. H. Hill, Mr. C. W. Hodson, C.S.I., Mr. J. C. Inglis, Mr. G. R. Jebb, Sir William Thomas Lewis (Cape Town), Sir Andrew Noble, the Hon. Charles A. Parsons, C.B., Mr. A. Ross, Mr. A. Siemens, Mr. John Strain, Sir John I. Thornycroft, Professor W. C. Unwin and Mr. A. F. Yarrow.

GENERAL.

Sir E. J. Poynter, R.A., has sent a letter to Lord Provost Walker, Aberdeen, expressing in the name of the Prince of Wales, president of the Royal Commission, as well as his own, their appreciation of his Lordship's courtesy in having allowed the valuable portrait of Sir David Stewart, by W. Q. Orchardson, R.A., H.R.S.A., to be exhibited in the British fine art section of the St. Louis Exhibition. Sir E. J. Poynter adds:—"By general consensus of opinion the British art section occupied, in point of excellence, the most prominent place at this exhibition, and was considered by competent judges to be one of the best and most representative displays that has ever been sent out of this country. By your kind co-operation an important international object, as well as a service to art and to the British school in particular, has been effected."

A Carved Reredos in St. Barnabas Church, York, representing Da Vinci's "Last Supper," has been unveiled. It is the work of Herr Peter Rendl, who took the part of St. John in the Passion play at Ober Ammergau.

Sir Alexander Binnie, president of the Institution of Civil Engineers and late chief engineer to the London County Council, has been appointed by the Irish Government to make further investigation and report on the drainage of Lough Neagh and the river Bann. It is pointed out that the appointment of this eminent engineer at the Government's expense does not necessarily commit the Government to make a grant towards the execution of a drainage scheme.

The Council of the City and Guilds of London Institute have conferred the Fellowship of the Institute on Mr. H. Cecil Booth, in recognition of the original and valuable engineering work which he has done since he gained his diploma of Associate of the Institute in 1892.

The Council of the Institution of Civil Engineers have made the following awards for papers read and discussed before the Institution during the past session:—Telford gold medals to Lord Brassey and Mr. C. S. R. Palmer, a George Stephenson gold medal to Mr. Lionel E. Clark, a Watt gold medal to Mr. J. F. C. Snell, Telford premiums to Mr. L. F. Vernon-Harcourt, Mr. R. W. Allen and Mr. William Marriott, a Crompton prize to Mr. A. Wood-Hill, and the Manby premium to Mr. E. D. Pain. The presentation of these awards, together with those for papers which have not been subject to discussion and will be announced later, will take place at the inaugural meeting of next session.

Mr. F. Whitmore, the Essex county architect, has been appointed architect also of the Essex education committee. For the first office the salary is 500*l.* a year, and for the second 250*l.*

The Royal Sanitary Institute announce that a general discussion will be opened on "Housing in Mansions let as Flats" on May 8 by Dr. Louis C. Parkes, M.D., and Mr. W. Rolfe, architect. The chair will be occupied by Sir William Emerson.

The Council of the International Society of Sculptors, Painters and Gravers has elected Professor Alphonse Legros and Mr. Joseph Israels as honorary members and the following as associates:—Messrs. H. Anglada, E. Bourdelle and J. Desbois, Professor Lanteri, Messrs. William Nicholson, Gaston Schnegg and Lucien Schnegg and Prince Paul Troubetzkoy.

Mr. Cuthbert Brodrick, formerly of Leeds and Hu architect of the Leeds town hall, who died at St. Mart Jersey, left property of the value of 7,490*l.* gross and 7,47 net.

A Limited Competition for a new parish church at Epsom is to take place between the following architects:—Mess Temple Moore, Nicholson & Colette, C. H. M. Mileha W. H. Bidlake, Charles Spooner, J. Bannister and J. Hatcha Smith. Each competitor is to receive 20*l.* Mr. Fellow Prynne is the assessor. The cost of the building is not exceed 14,500*l.*

The Extension of Wakefield Cathedral was consecrated on Tuesday. The new work is a memorial of the Bishop of Wakefield, William Walsham How. The plans were prepared by the late J. L. Pearson, R.A., and were carried out under the direction of Mr. F. L. Pearson.

Mr. Kivas Tully, consulting engineer and architect of the Department of Public Works, Ontario Province, died in Toronto on Monday. Mr. Tully was born in Ireland in 1820, and for over fifty years has held Irish and Canadian governmental positions. He was one of the best known engineers of the dominion, and was honorary president of the Society of Architects.

The Edinburgh Architectural Association on Saturday visited Drum House, Gilmerton, which was erected about 1724, and is believed to have been the work of the elder Adam. Mr. Hamilton More Nisbett acted as cicerone.

About £700 will be required for the repair of St. Peter Hungate, Norfolk, and the Chancellor of the Diocese has granted a six months' respite in order to see if the required amount can be raised. The donations already promised received amount to a little over 170*l.*

A Report on the Wedgwood Institute School of Art states that the premises are inadequate and badly arranged, the defects being mainly as follows:—The sanitary arrangements are unsatisfactory, the ventilation is indifferent, the day lighting is poor and the rooms scattered. There is a suitable conservatory in which plants for analytical study can be kept, and as a result there is not that amount of plant-drawing from nature that may be expected in a school where the study of design is of such importance. The committee appear to be alive to the necessity for the removal of these defects, and the question of providing a new school has already been considered.

The City Assessor of Glasgow is preparing for the plebiscite on the question of the opening of museums and art galleries in Glasgow on Sundays. A staff of fifty temporary clerks has been engaged to address the reply postcards, the number of which will be between 140,000 and 150,000. The card says:—"Please state on the annexed reply postcard (marked 'Voting Paper') whether you are in favour of, or object to, the Art Galleries and Museums being open on Sundays. The reply postcard to be detached and posted not later than May 14."

The Villa Farnesina in Rome has been opened to the public for an exhibition of architectural photographs.

The Carnarvon Town Council, at a special meeting on Friday, resolved to guarantee 5,000*l.* towards the establishment of the Welsh National Museum at Carnarvon. A deputation will approach the finance committee of the County Council with the object of securing the co-operation of that body.

Mr. William H. Hunter, chief engineer of the Manchester Ship Canal, has accepted an invitation of the Panama Canal Commissioners to act as one of the international consulting engineers. Mr. Hunter has been connected with the Manchester Ship Canal from its inception. While the canal was in course of construction he was chief assistant to Sir Leader Williams, and he was appointed chief engineer to the company when the contract was completed.

Mr. E. H. Bicknell will attend at the Waterloo town hall on May 3, and on behalf of the Local Government Board hold an inquiry into the proposals of the Waterloo-with-Seaforth Urban District Council to borrow 14,500*l.* for the purpose of improving the sewerage system of the district and 1,546*l.* for works of private street improvement.

A further course of lectures on 'carpentry and joinery' will be commenced at Carpenters' Hall on Thursday, May 11, in connection with the examination to be held at the same place in the second week of July.

The Lancaster Town Council on Wednesday decided to abandon the project for the erection of a market, although the contract was let some time back.

The Architect, April 28th 1905

BY PAUL VERONESE

The Architect.

THE WEEK.

Council of the Irish County Councils have voted the following resolution:—"That in view of immense importance to the nation of the preservation of all monuments of archæological, historical and architectural interest, we suggest that all persons competent to give information upon the subject, whether members of the Gaelic League or of our various archæological societies, should inform the secretaries of the respective County Councils of the locality of any stones, Druid circles, cromlechs, ogham stones, mounds, forts, menhirs, cranoges, ancient crosses, ruins, churches, castles, or any other structure of antiquarian or historic interest in their respective localities not hitherto scheduled under the Acts for the preservation of ancient monuments, with any information they can supply concerning them, and that the secretaries of the said County Councils be requested to furnish this Council half-yearly with such information. They may obtain on these subjects with a view to its publication, and to the eventual formulation of a national scheme for the preservation, as in foreign countries, of our ancient monuments for the nation." This resolution is likely to have more effect on the preservation of archæological remains than any Government institution. The dislike of the people to official interference is evident when we find they will not surrender antiquities of a small size to the nearest station, although the full value would be paid. A County Council is an institution of a different kind, and we may expect the peasantry will loyally comply with its requests.

In the case of the Kent County Council *v.* Folkestone Corporation decides two points of great importance to contractors and to public authorities, arising upon the construction (1) of the Public Authorities Protection Act, 1893, and (2) of the Locomotives Act, 1898. The facts of the case, and the provisions of the two Acts applicable, are as follows:—The defendants were using one of their roads, and entered into a contract with a contractor for hauling stone. The traction engines used by the contractor damaged roads repaired by the plaintiffs. The contract was for a year from January 1, 1902, to March 31, 1903. The damage was done between January 19 and March 24, 1903, and the widening of the road was complete in the September of that year. The plaintiffs began their action on January 11, 1904. The Public Authorities Protection Act limits the time for bringing an action against a public authority for acts done in pursuance of a public duty to six months. The Locomotives Act of 1898 provides that compensation for damage to a highway shall be begun within six months of the time when the damage has been done, or, when damage is the consequence of a particular contract or work extending over a long period, within six months after the completion of the contract or work. The Court of Appeal held (1) that the Public Authorities Protection Act did not apply. "The damage done to the road," said ROMER, L.J., "was done by certain contractors, and those contractors were not servants or agents of the defendants in doing that damage." It is clear that this is an important limitation of the scope of this Act. The principle would seem to apply to all wrongful acts of contractors employed by public authorities. It is clear from this and other cases that the Courts are not, as we have already pointed out, minded to give an extensive construction to the Locomotives Act, 1898, applied, and that the plaintiffs could recover the damage done during the preceding six months from the beginning of the action. It was

contended that there being a period of less than six months from the conclusion of the work of widening the road to the beginning of the action, the whole damage could be recovered under the alternative period provided by the Act. It was, however, held that the words of the Act, "work extending over a long period," applied only if there was one work, and that in this case the date of the contract for hauling the stone, compared with the date at which the road-widening scheme was complete, showed that the contract for haulage and the widening of the road were separate undertakings.

It is well known that the cities of the United States are advantageous markets for works of art by French artists. During the year the value of such works imported into New York alone was 447,000*l.*, an increase of 13,000*l.* over the year preceding. It has been calculated that France supplied 43 per cent. England, however, comes second with 23 per cent. of the imports. That may appear incredible, but statistics often reveal facts which are unexpected. There might be a larger percentage from this country if some of our sublime officials would condescend to suppose that artists have commercial interests like the leather dressers and tin merchants. In virtue of reciprocity agreements concluded with France, Germany, Italy and Portugal, paintings in oil and water-colours, pastels, pen and ink drawings and statuary can be imported at a lower rate of duty from those countries than from the United Kingdom. Is it not time that Great Britain should be placed on equality with Portugal, although a little trouble might be imposed on our official world or some section of it?

A LANDLORD who lets out rooms in his house is liable for any damage caused to his tenant by the defective state of the roof if he has not taken reasonable care to remedy the defects, and, *a fortiori*, if, after he has had notice that the roof is in a defective state, he has neglected to repair it. This principle was laid down in the case of HARGROVES, ARONSON & Co. *v.* HARTOPP. It was unsuccessfully argued in that case that there was no duty to repair in the absence of a covenant to repair. Lord ALVERSTONE, C.J., held that, though the landlord might not be liable if damage were caused by an accident against which reasonable care could not have provided, he was liable if, owing to his negligence, a part of the premises not demised fell into such disrepair that it damaged the tenants of the part of the premises which was demised. Having regard to the increasing number of premises let as flats at the present day, it is clear that this case lays down a principle of far-reaching importance both to landlords and tenants. It is evident that it applies not only to the roof, but also to staircases and to such other parts of a building as are used in common by various tenants of parts of the building.

Knossos is not exhausted, for apparently if funds were available it would be possible to reveal other surprises besides the Palace of MINOS. According to a telegram from Mr. ARTHUR EVANS, he has met with another ancient building on a hill west of the palace which is also remarkable. He says that "A paved columnar court has appeared leading to spacious pillar hall with six wide doorways. Building extends in every direction, with stone staircase and upper storeys much larger than Royal villa. Interesting finds of seal impressions and inscribed tablets. In one chamber extraordinary natural stone resembling human figure, apparently fetish cult-image. Architecture of great Palace period with signs of partial reoccupation in latest Minoan age." The financial condition of the Cretan Exploration Fund is unfortunately not adapted to meet the expense of exploration on a satisfactory scale. In reply to the treasurer's appeal only 50*l.* has been received, and at least 2,000*l.* will be required.

PAINTING IN THE ROYAL ACADEMY.

WE have heard of late of the manifestation of mysterious spiritual phenomena in this country. The observers might cite the present exhibition as an example. Never before have so many scriptural and allied subjects met the eyes of visitors. Mr. S. GOETZE has attempted the Crucifixion under the title of *He Emptied Himself of His Glory*. He has adopted a cross which differs from that employed for centuries by painters, the weight of the body not being entirely supported by the nails in the hands and feet. That recognition of realism, although not supported by tradition, might be excused. But the awfulness of the sacrifice is diminished when we see some of the Roman guards laughing at one of the MARIES, who appears to be scared. It is to be regretted that the artist has sacrificed unity by combining farce with tragedy, for otherwise both composition and execution are admirable, and the painting would have served for a church. Mr. BYAM SHAW represents CHRIST as standing in front of an Ionic colonnade, which is reached by steps with more rise than those of the Parthenon. The painting is to illustrate CARLYLE'S words, *The Greatest of all Heroes is One*, and standing or kneeling below are figures of CHARLEMAGNE, ST. LOUIS, ST. MARTIN and other warriors, while at both sides are kneeling knights in armour. It is a true decorative work, and ought to be a mural painting. By a coincidence which is probably only accidental, two large pictures in Gallery XI., which are on opposite walls, suggest the difference between the Semitic and the Greek spirit. Mr. HERBERT SCHMALZ represents the *Mount of Temptation* in the wilderness into which CHRIST was led by the Spirit to be tempted. We see "the bordering desert wild" and the "dark shades and rocks environ'd round" which MILTON imagined. The solitary figure seen amidst such surroundings commands sympathy, for He is communing with the Unknown. Mr. FRANK CALDERON'S Greek horsemen do not trouble themselves about mysterious problems. Life is for them a delight while they urge their steeds through the waves on a bright summer morning under the eyes of the chief. The painter has been inspired no doubt by the Panathenaic Procession, but his horses are more than ponies. The connection between suffering and Christianity is displayed with surprising detail in the immense water-colour, *A Dream of the Sorrowful Way*, by Mr. WILMER. Once more the Good Samaritan appears, and the scene is represented by Mr. DOYLE PENROSE with Biblical simplicity. Mr. BERNARD PARTRIDGE'S *Gabriel the Archangel* is well adapted for a church wall, and is curiously symmetrical. The *Finding of Moses*, by Sir L. ALMA-TADEMA, which is, we suppose, the costliest picture in the exhibition, although not of the sermonising class, is nevertheless scriptural. If the artist sought only to express the sense of the words, "She saw the child. . . . And she had compassion on him," he could hardly be more successful. The delight on the face of the princess is almost vivid, and the child conducts himself with the dignity and gravity of a born legislator. Everything else in the picture is of minor importance, but they are shown in a way which, if marvellous in execution, is distracting. The long line of blue flowers in the front demands attention; the grave palanquin-bearers and the maids of honour also assert themselves as if they formed the important parts of the painting. On one side of the Nile we have detail, and the crowds on the opposite bank by contrast appear as indistinguishable as a cloud of dust. The general effect when seen at a distance is that of strata of colour which are not in concord. It is, however, a great work, and for once marble is not prominent. With the exception of the *Moses*, we suppose the majority of visitors will barely glance at the paintings we have mentioned, but they testify that if a demand arose for "High Art," or for wall-decoration of a serious kind, there would be no difficulty in meeting it.

We suppose there is no market for historical pictures, and figure-painters are therefore chary about

attempting them. Mr. EDGAR BUNDY, in *Morning Sedgemoor*, has a picture which illustrates and adds force to MACAULAY'S description. There is no need to suggest that the brave peasants and miners who followed MONMOUTH were asleep at that time, for at dawn in the morning they began their dreary march, but may imagine there was a brief interval of repose. The scene is the prologue of one of the greatest of English tragedies. Mr. JOHN CHARLTON'S *Balaclava Charge of the Light Brigade*, depicts the 17th Lancers' work, and justice is done to the coolness and bravery of the Russian gunners. But is it not time that the CARDIGAN myth should be exploded, for painters appear to think he was all over the field? We hope HENRY is not anticipating history by his two pictures of a contest between a great foreign warship and an English destroyer. In *Betrayed*, the *Moon* we see the vessel, which is strongly lighted, about to receive a torpedo from the destroyer, which is in comparative darkness, while in the *Escape of the Destroyer* the work has been accomplished and the smaller vessel has no longer an enemy. There are some paintings which were inspired by Trafalgar, and there is a scene from the Afghan war. Mr. INNES FRANKLIN'S *The Waning of His Greatness* adds one more to the representations of the interview between WOLSELEY and the nobles. In Mr. GOW'S *Roman Triumph* everything is spick and span—the whitest of horses, the brightest of costumes, the most correct architecture, but it wants the stamp of reality. SWIFT'S estimate of the cost of a triumph suggests that the new dresses and appointments of the circus manager were always obtained. Mr. J. C. DOLLMAN'S *Harvest* may be regarded as historical, for it reveals an everyday scene in our latest war in South Africa. It depicts a farmer's cart filled with wounded soldiers and accompanied by others who insist on limping along the rugged road. The picture is a composition in drab grey, and the artist keeps strictly to truth; but the pathos of the scene strikes the observer at the first glance.

The paintings which seem most in favour are representations of ordinary life, or of the occasional scenes which it is elevated. As the most pleasing of the class, Mr. BRAMLEY'S *Grasmere Rushbearing* should have been hung in a more important room. It is a record of that nature worship which still survives. There is idealising of the children, and they are not pretence to be demure. Although they are singing, the features are not distorted. The old church tower in the background indicates that ecclesiastics may have modified the pagan ceremony. Mr. LORIMER'S *Midsummer Eve Reverence to Roses*, is another picture of the same class, but more difficult to carry out. Whether it is a failure of the artist or one of the May scenes for teaching due to RUSKIN'S influence, we cannot say. A statue of CUPID is in the centre of the circle of roses, and may be the object worshipped. The young women who wear white gowns have joined hands and form a circle about the buds, and bend or kneel in homage. The action is not easy to express, and some of the figures recall the swimming, sprawling and languishing of the fine ladies in the "Vicar of Wakefield." There are also figure women who seem to have gone through the rites.

Fisherfolks are of late recognised as natural picturesque, and year after year they appear before us as if their manners and customs were inexhaustible. Mr. STANHOPE FORBES makes discoveries in one direction, Mr. LANGLEY in another. Mr. J. R. REID appears to imitate Mr. HOOK. Mr. TITCOMB shows a girl listening to the address of *The Pilot*, who is accompanied by an altar-boy who carries a processional cross. A forest of masts adds to the effect. This subject worth painting, while many others on the walls are too commonplace for appearance in cheap publications. As there is shade as well as light we suppose there must be sin, however the pilots may labour. Hon. JOHN COLLIER will no doubt in time have found

gallery of crime. *The Cheat* is a bridge party of four. One of the two ladies has sacrificed honour for victory, but as both seem to be capable of wrong, it is impossible to say who is the culprit. If there are problem plays, problem pictures may be necessary, and Mr. COLLIER is an adept in their preparation. What a contrast offered between such scenes as Mr. COLLIER paints, and which hereafter may serve as evidence of the decadence of a class in our time, and the rustic scenes of LA THANGUE observes, and which the sun seems to illuminate with unusual brilliancy. This year has brought subjects from Italy, a land that is well adapted for his pencil, but there is nothing to surpass *Sussex Orchard*, two figures filling a cart, although apples from their greenness would scare a school-boy. Why does not Mr. MACBETH turn his attention to English subjects? *The Flowers in Alsace*, a stall in an old building attended by two girls, is the most charming of the smaller pictures. There is beauty in every line, and the colours are varied and brilliant. His *Nightingale's Song*—a girl listening to the bird at a window—is a masterpiece of light and shade, which asserts itself among some of the principal pictures in Gallery III. Mr. BARTLETT is again successful in representing Irish peasants in his *Waiting for the Island Boat*, co. Donegal. Since BURTON abandoned Ireland after the collapse of young Ireland no artist has been so careful as Mr. BARTLETT in recognition of racial types. His northern men and women differ from those in his western scenes. It is the reverse of the late Mr. NICOL, who, as a caricaturist, created a conventional type to which he was faithful.

Portraits this year are abundant. The foremost for subject and treatment must be awarded to the *Portrait of Her Majesty*, by Mr. LUKE FILDES. It suggests a wealthy nation. The dress appears to be entirely of cloth of gold. A similar material appears as a background by accident on the table on which the QUEEN's hand rests, and is again suggested by the drapery of the room. The jewels are countless. But all these are only subordinate accessories, which do not detract from the interest which belongs to the royal lady. The artist has triumphed by compelling the richest robes to yield to dignity, grace and beauty. *His Majesty the King*, by Mr. HAROLD SPEED, is a commission of the War Office. His MAJESTY is in field marshal's uniform, with the cloak of the Order of the Garter, which falls at some length on the floor. The right hand holds an ormolu while the left holds the cloak. The artist's capital should be proud of the work. Our KING does not pose, and in this case we see an unaffected, serious English gentleman gorgeously robed. Another field marshal is introduced in the portrait of the *German Emperor*, who holds his bâton of command, as if it were a symbol of authority which he had resolved to exercise. Is it Englishmen or Germans who have caused the countenance to assume a grim look? In these days it is dangerous to name an interpreter of a monarch, and Mr. A. S. may have felt it his duty to give a warning to all who gaze on his portrait.

We hope Mr. HERKOMER's *Communal Sitting of the Members of Landsberg, Bavaria*, will not excite a mania among our local boards to have their full-length figures situated in life-size proportions. If so the auditors would see the cost is not payable out of the rates. An artist some years ago presented a similar panoramic view of Bavarian "public men." The picture may be an ordinary portraiture what stage landscapes are to be seen in the gallery, but there can be no question of the vigour shown by every figure. The principal figures at which the members are seated is placed in front of the windows, two of which are open, and the opposite houses are visible. The mayor alone is standing, all the others are seated, but there is a "free and easy" air about the group as well as the individuals, which is suggestive of a liberty than is usually accredited to German councils. Another large portrait is *The Marlborough*

Family, by Mr. SARGENT. It may be a symbol, for the American lady and her eldest son are the principal figures, while the duke and the younger son are subservient to them. In other words, English family pride has to succumb to American dollars. The painter might be trusted to express the supremacy of his own country. But American artists, if any of them visit the exhibition are likely to prefer Mr. SARGENT's *The Lady Helen Vincent*, which is comparable with GAINSBOROUGH's *Mrs. Graham* in the Edinburgh gallery, and more especially the *M. Léon Delafosse*, which is the most interesting of the artist's works. The portrait of *Howard Colls, Esq.*, proves that neither Mr. ORCHARDSON's eye nor hand has suffered by his late illness. Mr. COPE's portrait of *The Late Sir William Vernon Harcourt* presents the statesman in his robes of Chancellor of the Exchequer. But in those days he had gained his highest success, he was vigorous, and his expression was more buoyant than is shown. Mr. W. ONSLOW FORD does justice to the benevolent, intellectual and self-sacrificing *Rev. Stopford A. Brooke*. Another excellent portrait is *Sir John French*, by Mr. EDMUND BROCK. A remarkable group is *Cubbing with the York and Ainsty: Children of the Master, Lycett Green, Esq.*, the only work in the exhibition by the late C. W. FURSE. Although it is hung on the second line it becomes the most effective picture on the wall. This may be partly owing to the crowding of the figures, for they are closer than is safe with ponies. But, as a mass, they become more impressive to a spectator than if they were kept a little apart. The adoption of so curious a model as we see in the *Blue-bow* of Mr. SHANNON is inexplicable. From every point of view the face appears blackened. He is far more successful with the faces of *Lady Dickson Poynder and her Daughter*, but the hands are characterless.

There are several attractive landscapes. *Moonrise on the Ouse*, by Sir E. WATERLOW, is one of his most successful paintings. It may be compared with Mr. EAST's *Autumn in the Valley of the Ouse*, for the two give us the beauty of the district at different periods. Mr. DAVID MURRAY is varied this year, and he even attempts a Scottish water mill-race outside a town; but the selection of *Swedes* for his diploma work suggests that he believes his power is strongest when it keeps close to the ground. Mr. LEADER, besides one of his familiar South coast scenes of silver sand and blue flowers, has given a view of the Thames and a Cornish cliff scene, *The Incoming Tide*, which, from the care taken with the rocks, recalls the manner of the late Mr. BRETT. The President, in his *Surrey Chalk Pit*, has a characteristic figure-painter's landscape. The elements have all to be definite, but there must be no distance or need for aerial perspective. His ability in landscape has served him in the *Cup of Tantalus*, a pleasing group at an antique fountain, for the trees and the light passing through them on the steps are well rendered. Mr. LESLIE this year has a view of *Bushey Park*, without a single figure. It is needless to remark that the trees all appear in the green he invented, and which is his peculiar property.

The Water-Colour Room contains drawings which are superior to those to be seen in the special exhibitions. Several members of both societies will be found among the contributors. It would appear as if the Royal Academy could become the representative of the most national form of art by the adoption of a less exclusive system of tactics.

LORD GRIMTHORPE.

THERE was a time when Lord GRIMTHORPE was regarded as the most bitter enemy of English architects, but of late years he could read their journals without finding in them a word from an architect against himself. He was the type of a pugnacious JOHN BULL, and circumstances increased his natural tendency to take a part in rows. There could be no doubt of his hard hitting, and when in a fighting humour he cared little whether those he attacked were

strong or weak, and he was as pitiless with men who were supposed to be his friends as with his enemies. Those who met him at the opening of the WHISTLER Exhibition probably imagined he was there with the intention to give the final blow to the artist's reputation, but the old contentiousness had at length subsided.

He was born in 1816, and was the eldest son of EDMUND BECKETT, who in that year assumed the name of DENISON. Having been called to the Bar in 1841, after a time he selected Parliamentary committee-rooms as the scene of his labours. He could not have had much practice in ordinary Courts during the four years which elapsed after his call, and when questions arose over the effect of a new clause in a private Bill he usually declined to give an opinion, and suggested that the difficulty should be submitted to a specialist. His Cambridge training in mathematics and his aptitude for mechanics enabled him to take more interest in engineering subjects than the ordinary junior counsel. But the leaders in Parliamentary committee-rooms were powerful and opposed to additions to their ranks. Not until 1854 was Mr. DENISON appointed Queen's Counsel. Then his energy was able to display itself. It was easy for a stranger to see from his manner whether he was on the same side as the witness or on the opposite side. He kept his point rigidly before him, and no matter what a witness might urge by detailing a theory, he appeared to slight it and treated it as an evasion. One of the principal engineers for gas-works while under cross-examination appealed to the crowd of experts in the room, and piteously asked whether they did not understand what he was explaining. Mr. DENISON remarked, "I have to understand you, not those gentlemen, so let us go back to the question I put to you an hour and a half ago. I then asked, &c.," and the torture was renewed. He was as ready to show his sternness to the committee as to a clerk of a Parliamentary agent. Only with HORE SCOTT did he appear to be reverential. A man with such qualifications was invaluable, and he could command any price he pleased for his advocacy. His services were secured in advance in order to deprive the opposite parties of his skill. We suppose he considered it was monotonous to be always conquering civil engineers and surveyors. It would be a change to have an occasional tussle with architects. They were not, however, often seen in committee-rooms, and had to be reached in another way. Unless we are mistaken, he began to challenge them in the lectures on Church Building which were delivered for the benefit of the fund for rebuilding St. George's, Doncaster. At the desire of the committee they were printed, and they were so outspoken a second edition was quickly demanded. Besides the architects, he invented another opponent in Mr. RUSKIN, and some of Mr. DENISON's friends complained about what he said concerning upholstery, flower-pots, daylight candles, crosses, lock-up chancels of the "posture and imposture churches." It was characteristic of the author that he could see no reason why they should complain. The volume of "Lectures on Church Building," now that the squabbles it inspired are ended, is of interest as an example of how a strong man without feelings endeavoured to arrive at conclusions by his logic alone, or in other words, to prove his case. He goes through antiquity in order to discover that the geometrical style is the most eligible for Doncaster Church, but as transmuted by the lecturer's advice. There were incurable mistakes in spite of his co-operation, "because the architect takes for granted that he can divine the effect of construction which he has never seen before in stone, or even on paper, drawn as they will really look." Mr. DENISON drew one conclusion from his experience at St. George's which he thus expressed:—"I advise everybody further to stipulate that he shall be well and truly furnished with a copy not only of all the drawings and specifications, but of every bill of quantities, or other paper

which is supplied to or laid before the builders to them in preparing their tenders."

In the "Book on Building" the same design to amend the ways of architects is revealed. It cannot be said they have suffered by his efforts. A writer like Mr. DENISON was treated as a performer. His hitting amused the public, and the more exact he became the more his performance was enjoyed. But he was not satisfied with being a censor, resolved to demonstrate what he could do as an architect and builder, and the cathedral at St. Albans will be enduring evidence of his presumption and expenditure.

He was more successful with bells, clocks and "Big Ben" is his second attempt, but whether he is responsible for the failure of the first bell cannot be determined. He loved bell-ringing, and his musicality may be attributed to the practice. Some clockmakers still accept his formulæ, although he once said his great escapement was denounced as an imposture, and at least nineteen out of twenty clockmakers would condemn in five minutes every one of the best made on his plan. As for locks they afforded an argument to his Lordship even in later years.

All the subjects we have mentioned were insufficient to monopolise his restless activity. Acting as a legislator for church building, it was only a step for him to become the overseer of the practices in the Church. He therefore resolved to become Chancellor of York as well as Vicar-General. Few would have dared to compete with him for the office, and even the Archbishop ventured to interfere with his procedure. His endeavour was to keep the Church within a groove which he defined and, whatever inconvenience, he succeeded. He was always ready to demonstrate that he was a militant official.

For nearly fifty years he was a constant visitor. There was no need for him to sign a letter in a paper or to put his name on the title-page of a book. His style was too personal not to be recognised. He made no pretence to be rhetorical or formal. He expressed admiration for FERGUSSON'S "Handbook" because of its distinctness, precision, economy of words and absence of sentence-making. In a measure he described the characteristics of his own writings in his speeches. When addressing a committee there was exordium in his speech; he put the subject before the members with deliberation and apparent conviction. He seemed to be full of information, but was obliged to restrict himself out of consideration for the committee. His books and letters correspond with his speech. He sought after plainness and never sacrificed fact for phrase-making. The result was that when he attacked anyone his blows wounded like a bludgeon. From his character we may suppose his bitterness and intolerance gave him pleasure in exercising it. Whether the world is any better by his long and successful career, or, in other words, whether he deserves to be numbered among English worthies for his services is a question difficult to answer. All the Bishop of ALBANS could say of him was that he restored the cathedral (we all know how) and wrote a tract.

MARTIN MACDERMOTT.

WHEN this Journal was started one of the contributors from whom much was anticipated was MARTIN MACDERMOTT, an Irish architect. He possessed not only of varied professional experience but he could also claim to be a practised journalist. Mr. MACDERMOTT was, however, unable to enrich the *Architect* with many articles. Those who knew his ability often expressed surprise that so able a writer of poetry as well as prose seemed to be indifferent to literary fame. His most important work was a translation of VIOLET-LE-DUC'S "History of Military Architecture." The true explanation was perhaps that he was without the influences which were best adapted

inspire him. MARTIN MACDERMOTT to all appearances was an English citizen, but in his heart he felt the pangs of exile. He had staked his life for the independence of Ireland, for when he died at Cotham, Bristol, on April 26, he was almost the last survivor of the great movement in Ireland which was brought prematurely to a close by a fiasco in 1848.

The Young Ireland Party are now associated with the affair in the cabbage garden at Ballingarry as if it were their crowning exploit. But the aims of the enthusiasts who were the founders of the party were directed towards the victories of peace as well as of war. They sought for the emancipation of the Irish intellect, and men who cared little for politics became Young Irelanders in the hope that archæology, literature, art and science might be advanced. MARTIN MACDERMOTT was one of the earliest to take part in the new movement. He became a contributor to the *Nation*, which was the organ of the party, and was one of that inner council which embraced many of the ablest men in Ireland.

Unfortunately, the time was not favourable to the constitution of an "Academe still and contemplative in living art." The terrible famine of 1847 was enough to return the reason of sensitive men. Then came the continental revolutions. France was supposed to have opened a new era, and posed for a brief time as the protector of oppressed nationalities. Ireland was believed to have the first claim on French aid. Many men were overcome by their emotions. MARTIN MACDERMOTT was not backward when the crisis appeared to be imminent. But something else was needed besides warlike articles and poems. If there was to be a revolution in Ireland it was necessary to obtain money, arms and officers from abroad. MARTIN MACDERMOTT was selected as one of the three confidential agents who were to undertake the treasonable mission. He went to Paris, with what success was never publicly revealed to him. The Government were not ignorant of what was being done abroad, and the few scenes remaining to be acted before the curtain fell on the drama of independence were hurried. When, after the fiasco, there were trials for high treason, and it was proposed to obtain on behalf of the prisoners the testimony of LAMARTINE, the ex-President wrote to say he was prepared to attend and swear that neither directly or indirectly did the Irish agents demand aid for an insurrection. But in his "History of the Revolution of 1848" he asserted that he had refused to attend to their claim to raise a civil war in England, for he did not consider all weapons were fair to fight with against a rival but friendly power. There could be no question of the interview, and it was supposed by the representatives that, although LAMARTINE said his lips were sealed, his silence conveyed hope, and it was taken for granted that France would not only speak out, but was to defend the flag of freedom against swords and bayonettes. It was not the first time Irish revolutionaries were deceived.

The efforts of the Young Irelanders were made to end in ridicule. MARTIN MACDERMOTT for a time remained in Paris, and acted as correspondent of the *Nation* when it was revived. But his political aspirations were at an end. He resumed the practice of his art. He obtained the appointment of chief architect to the Office of Works of the Khedive, and remained in Egypt for some years. When he came to England he appeared as if he did not care much about commissions. They came to him, but he was not satisfied whenever he found that his designs had to be altered for the sake of economy. Among his works were some of the stations of the Metropolitan Extension lines. He was interested in some patents, especially in a coal-working machine. He well earned the repose which followed his retirement from the Metropolis. In his latter days he must have thought of the noble band of which he was the sole survivor. A few years back he wrote:—

When I think of those friends of mine in the long-buried past—nearly all of whom are silent now since long years—I seem to be walking in a world to which I do not rightfully belong. As I think of them, I think of the young, the bright, the hopeful, the happy; and what alliance can an age of exile claim with such qualifications? Yet it is still a pleasure to recall such men to one's memory. Are there any like them now? Standing apart and alone, I do not know, but I hope there may be, for these were men worthy of all honour. As I think of them I recall a joyous company—a "band of brothers"—sometimes gathered round a pleasant table; sometimes wandering through the Wicklow glens and by the dark mountain lochs in sight of the blue waters of Dublin Bay; sometimes, too, penned together within the gloomy courtyard of Newgate Prison; but always, so long as I knew them, knitted together by the twin bands of brotherly love and love of country.

In the early days of the *Nation* it seemed to be incumbent on every Irishman to make attempts at rhyming. Some were successful, and many thousands of the national ballads and songs have been circulated. The verses of MARTIN MACDERMOTT were never collected, but in one of the anthologies he edited he introduced a few of his own. We append a few verses in which he expresses the effect made upon himself by the troubles of 1847, when Ireland was decimated by famine:—

"I must be very old," I keep
Repeating o'er and o'er;
And yet, by the old Bible-page
(Where our good father marked my age)
My years are twenty-four.
What, twenty-four! Life's sunny prime!
Life's early Age of Gold!
When thought is warm, when hopes are bright,
And hearts still stirred with young delight—
Ah, no! *my* heart is cold.
I must be very, very old—
A very old, old man!
They say my hairs are thick and brown—
I *feel* them thin and grey;
They say my cheek—though pale—still bears
No furrowed trace of tears or cares—
I care not what they say.
Does my step totter? No, I pace
Erect and firm, and bold!
What then? Deep underneath the lid
Of my strong heart the worm is hid—
The worm that's keen and cold.
Ah me! I must be very old—
A very old, old man!
For why? The glad sun's genial rays
Fail to make my heart glad;
And strangely as a thing foregone
Striketh youth's soaring joyous tone,
Upon my soul so sad.
I love the night-time more than day—
The night with stars so cold;
And better quiet thought than mirth,
Though it were round a Christmas hearth,
Where tales of love are told.
In sooth, I must be very old—
A very old, old man!
I know not now (I am so old)
How long it is ago,
But, sure, it must be very long
Since I beheld a nation, strong
In hope and valour grow.
Her voice was loud, her bearing proud
And glorious to behold!
And now where is she? What is she?
A beggar upon bended knee,
A slave that's bought and sold.
Indeed I must be very old—
A very old, old man!

As he was born in Dublin in 1823 MARTIN MACDERMOTT could be considered a very old man when he died. By some critics he was supposed to have acted unwisely before he reached his third decade, but there can be no doubt he set aside his own interest in the hope of serving others. He almost succeeded in becoming an historical character, but his failure was fortunate for himself and for his country.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE annual general meeting of the Institute was held on Monday last, when the report of the Council was presented. It announced that the losses by death have been as follows:—Fellows: William Henry Arber, Walter Aston, James Barnet, Francis William Bedford, Thomas Blashill, James William Brooks, Francis Edward Caws, Richard Knill Freeman, Arthur Green, George Fowler Jones, Frank Manoah Kent, Robert Kerr, John Norton, Arthur Edward Perkins, Ellis Herbert Pritchett, William Alfred Royle, George Hurst Stanger, Frederick William Tasker, James Thomson, Frederick S. Waller, John Thomas Wimperis. Associates: Charles Bennett Arding, Percy William Barrett, Norman Michael Brown, Charles John Ferguson, Percy Christian Gibbs, Edward Baldwin John Knox, John Mossop, Samuel Joseph Nicholl, Charles Pertwee, Ernest Simm, Henry Ernest Stelfox, Samuel John Thacker, Thomas Edward Thickpenny, Arthur Charles Wissenden. Hon. Associates: James Lewis Thomas. Hon. Corr. Members: L. C. Pedro d'Avila, Professor Fenger.

The following tabular statement shows the present subscribing membership of the Institute, compared with that at the corresponding periods of the last two years:—

Year.	Fellows.	Associates.	Hon. Associates.	Total.
1903	627	1,117	43	1,787
1904	644	1,142	43	1,829
1905	677	1,182	45	1,904

During the year 57 fellows have been elected, 65 associates' 1 honorary fellow and 3 honorary associates.

The progressive examinations were held in June and November 1904. The preliminary was held in London, Belfast, Birmingham, Bristol, Cardiff, Exeter, Glasgow, Leeds, Liverpool, Manchester, Newcastle-on-Tyne and York; the intermediate in London, Belfast, Bristol, Glasgow, Leeds, Manchester and Newcastle-on-Tyne. The Council desire to record their thanks for the valuable services rendered by the hon. secretaries and examination committees of the various allied societies. The final and special examinations were held in London.

The registration committee appointed last session, and constituted as described in the last annual report, began their labours too late in the session for any effective result, as the Council elections in May very considerably changed the *personnel* of the committee. The new committee early in the present session appointed a sub-committee which has met monthly, holding morning and afternoon sittings. A Bill for the enrolment of qualified architects prepared by the sub-committee with the assistance of counsel has been considered by the general registration committee, who have referred it back to the sub-committee for emendation. The registration committee hope to submit it for the adoption of the Institute at an early general meeting.

It was mentioned in last year's annual report that the Council had under their consideration the proposals of a committee on architectural education consisting of members and non-members of the Institute which they had appointed. The Council have approved of these proposals, and have established a Board of Architectural Education with a mandate to prepare a scheme for the co-ordination of architectural education throughout the country, and to secure, if possible, its adoption in the various schools. Of this committee Sir Aston Webb, R.A., is chairman, Mr. Basil Champneys vice-chairman, Mr. John Slater and Mr. Reginald Blomfield, A.R.A., hon. secretaries. It consists of "members," who are all architects, and "advisory members," who are representatives appointed by universities and other educational bodies. The first portion of the task has been accomplished by the Board, which is now laying the scheme before the teaching centres of the country with a view to its adoption. The scheme, admirably put before the Institute in a sessional paper read by Mr. Reginald Blomfield on February 20, has been printed in the Journal.

A memorial setting forth the disadvantages to the community of municipal officials being entrusted with the design and execution of architectural works was sent in November last to all the county councils, municipal councils and district councils of the United Kingdom. The Council, although aware of the improbability of the principles stated in the memorial being at once adopted by municipal bodies, yet entertain the hope that the prominence with which this important question was brought before them will have considerable influence for good.

The Council have appointed a committee, consisting of a sub-committee of the practice committee, the chairman and

hon. secretary of the science committee, the hon. secretary of the art committee and Mr. Lacy W. Ridge, to consult and report to them on all matters connected with the London Building Acts (Amendment) Bill now being promoted by Parliament by the London County Council. The Council adopting the recommendation of the committee, decide to oppose the Bill in Parliament. A petition was deposited and Mr. Pembroke Stevens, K.C., and Mr. H. Court Munroe retained as counsel. The committee drafted detailed criticism of the Bill as instruction to counsel who Bill should reach the committee stage in Parliament. At second reading, however, the London County Council dropped the greater portion of the Bill, retaining only the clause relating to the prevention of fire. The new Bill received will have the committee's attention. The hearty thanks of the Institute are due to the members of this committee for the self-sacrificing way in which they have carried on their arduous and continuous labours. The judgment of the House of Lords in the case of *Colls v. Home and Colonial Stores* induced the joint committee of the Institute and the Surveyors' Institution to drop Part of the Easement of Light Bill which dealt with this subject and also the only other clause relating to a change in law, *i.e.* Part V., headed "Right to Light passing through Streets," and the Councils of the two bodies have approved the omission. The Bill as now about to be introduced into Parliament by Mr. J. Fletcher Moulton, K.C., M.P., is a Bill of Procedure, providing a simple machinery for the settlement of disputes on the lines of that already organised in regard to party-wall cases.

Until last session the Council had strictly observed the principle of limiting their advice on professional matters to such cases as were not of a purely legal character. Having, however, considered that it might be advantageous to members if this limitation were modified, the Council have constituted a Board of Professional Defence to consider cases of broad professional interest, to give advice, subject to the approval of the Council, to take counsel's opinion on any point, and if necessary and desirable to support the architect's case, financially or otherwise, in court of law. Up to the present time the cases that have come before the Board have not been, in their opinion, of such a nature as to warrant positive action on their part.

A Bill making it penal for any unauthorised person to use the title or distinctive letters of a chartered institution was introduced last Session in Parliament, but dropped. It is again before the House this Session. Nine chartered bodies, including the Royal Institute, are promoting the Bill.

In accordance with the recommendation of the art committee mentioned in their last annual report, the Council have been in communication with the Royal Commission on London Traffic, urging that the views of expert architects be considered on the laying-out of street improvements. It being too late for evidence to be taken, the Commission have promised that the Council's request shall be borne in mind in the event of any definite scheme for the improvement of London streets being contemplated.

It was mentioned in the last annual report that the views of the Institute regarding the London County Council laws as to the deposition of plans with respect to building had been communicated to the Local Government Board, the London County Council and the London borough councils. The Council, acting on the recommendation of the practice committee, have issued invitations to the borough councils who expressed themselves as being in sympathy with the Institute to join the practice committee in a deputation to the London County Council. The Surveyors' Institution has also been invited to send representatives.

On the suggestion of the President, the Council have appointed a small committee to recommend steps which the ignorance of the general public in architectural matters may be somewhat mitigated. The committee have now issued their report.

The Council have had an album prepared containing photogravures of the interesting collection of the portraits of past Presidents. Blank plates have been left for the insertion of future portraits. The price of the album is two guineas.

The Council, at the invitation of His Majesty's Government, suggested the names of seven architects for the proposed extension of the British Museum. Mr. J. J. B. A.R.S.A., was the architect selected.

At the request of the Minister for Foreign Affairs the Council would advise him as to two architects who

James he might, in response to invitation, submit to the Dutch Government as fitting persons to be invited to prepare designs in an international competition for the Carnegie Foundation—"The Palace of Peace"—at The Hague, and as a third who could serve on the international jury, the Council nominated the president, Mr. John Belcher, A.R.A., and Sir Aston Webb, R.A., to represent Great Britain in the competition, and Mr. T. E. Collcutt, vice-president, to serve on the international jury. The Council have since arranged through the Genootschap "Architectura et Amicitia" at Amsterdam that the Carnegie Foundation Commission have decided to throw the competition open to all architects, and at the same time specially inviting representative architects from the various countries to compete.

The balance of income over expenditure is 1,680%, the best on record, which the Council venture to think is a proof of the continued financial prosperity of the Institute. The Council have this year invested the sum of 1,500% in the purchase of Cape of Good Hope Three and a Half per cent. stock, and 1,000% in the purchase of Great Northern Railway Four per Cent. Preference stock. The total invested capital of the Institute now amounts to 18,000%.

The art standing committee report with regard to the present wood pediments and dome on the centre part of Somerset House, facing the river, the committee felt that no action should be taken, and consequently forwarded a resolution to H.M. Office of Works that it was desirable to place the present wood pediments and drum of the dome in Portland stone, carrying out the existing design. There are no apparent structural difficulties in the way of this being done, and it was considered that a more permanent material would harmonise with the monumental character of the buildings. Beyond a formal acknowledgment of the committee's letter no reply has been made by H.M. Office of Works, and it is felt that this matter is of such public importance as to warrant a further letter being sent to the Office of Works.

The committee forwarded to all the metropolitan borough councils a communication respecting the abuse of advertisements on buildings with a view to enlisting their support and sympathy, and were gratified to have responses from ten metropolitan borough councils, expressing their sympathy with the objects in view, and a resolution was therefore sent to the London County Council drawing attention to the abuse of many buildings in prominent London streets by being disfigured with advertisements which were practically of a permanent character, and suggesting that the London County Council should obtain powers to prevent the disfigurement of streets and buildings with advertisements.

With respect to the Royal Commission on London Affairs the committee suggested that in all future schemes for public improvements for London streets the Institute should be consulted at an early stage with respect to their architectural aspect and development, and it is satisfactory to note that the Royal Commission, in acknowledging the receipt of the suggestion, stated that in future works of this character the Institute would be consulted in the initial stages. Had this been done in the matter of the alignment of the north frontage of the Strand Improvement Scheme it is probable that the view from the west of St. Clement's Church would have been preserved. By the proposed dilapidation half of the west front of the church will be hidden by the new north frontage of the Strand, and it is only to be regretted that the advice of the Institute in this matter was not asked.

The literature standing committee state that the extra grant of 25% again received by the Council has enabled the committee to extend the loan collection by the purchase of many much-needed works in duplicate. These increased facilities have been much appreciated by the students who use the library. The committee desire also gratefully to acknowledge the increase by the Council of the yearly grant to the library. The amount of the total grant is now, therefore, 150%.

The practice standing committee report that the question of members of the Institute advertising in newspapers, as practised in some cases in the provinces, was referred by the Council to the committee, who recommended the Council to take means to prevent or induce its members to discontinue this practice, which they considered derogatory and damaging to the status of the architectural profession. The question of members of the Institute describing themselves as "valuers" and "estate agents" in newspaper advertisements elsewhere was also referred to the committee, who reported to the Council that in their opinion nothing further

than the description "architect" or "architect and surveyor" was consistent with the dignity of the profession.

The Council referred to the committee a request by the Institute of Builders that provisions should be made in building contracts by which the charges of county and urban authorities in these matters should be ascertained by architects previous to the making of contracts, and the liability removed from the shoulders of the contractors. The committee, however, recommended to the Council that the suggestion should not be adopted.

The science standing committee say they have been engaged on standardising the specification and tests for Portland cement, the chairman has attended the meetings of the joint standard committee, and the standard has been fixed and is now published. The committee are now considering the tests that can be put in specifications when only small quantities of cement are required. The committee are inquiring into the present method of applying Dr. Angus Smith's solution and other preparations for protecting iron.

SOCIETY OF ENGINEERS.

A PAPER on "The Parade Extension Works at Bridlington" was read by Mr. Ernest R. Matthews at the meeting of the Society on Monday.

The new works, now in course of completion, and designed by Mr. Matthews, provided for an extension 40 feet seaward and 212 feet northward of the old parade, and included the construction of a low sea wall. The big sea wall was 355 feet in length, with foundations and backing of Portland cement concrete, six to one. The new wall projecting seaward naturally had a greater section than the old wall. The concrete foundations were carried well down into the boulder clay, being 4 feet 8 inches in depth and 15 feet 6 inches in width. The wall was 29 feet 6 inches above clay level. An important point to be noted was that all face joints in the sea wall were pointed up with Portland cement. There was no apron at the base, and when an apron at the foot of a wall was necessary he favoured the stepped form as being the only effective one. The most suitable stone with which to face a sea wall was granite, but the cost usually prohibited its use. The form of slope best calculated to resist the action of waves was a steep slope of two in one with heavy pitching. At Bridlington the beds of all stones were roughly dressed and vertical joints were finely picked, as they increased the power of resistance in comparison with smooth beds and smooth vertical joints. The difficulty with the low sea wall, 455 feet long and 21 feet 7 inches above foundation bottom, was to make it sufficiently strong to resist the action of the sea, and a heavy type of dowel had to be employed, with special methods of fixing. In constructing steps the author had followed what he believed to be the best plan and had set them within the line of the wall. A concrete arch, springing from a concrete retaining wall, had been put in at the back of the low sea wall, a practice which was to be recommended. At the back of the low sea wall were a number of terraces rising in tiers, connected by flights of steps and divided by the retaining walls, which had a total length of nearly half a mile. Some of the retaining walls have been constructed on the principle that the thickness of wall at the base should be one-third of the height, but in a majority of instances the section had been increased. A striking instance of the phenomenon of clay expansion occurred during the building of one of the retaining walls. The sea walls were designed upon the principle that the thickness of walls at the base equals half the height. The cement specification was practically the standard, and it was interesting to note the result of experiments made to ascertain the relative strength of briquettes in which the cement was mixed with fresh water and then compared with those mixed with salt water. It was found that while the use of salt water in the seven-days' test increased the tensile strength of the briquette, a depreciation in strength took place subsequently, while with fresh water there was the usual increase of strength with age.

Sir Douglas Fox & Partners, the consulting engineers to the Rhodesia Railways, Ltd., have heard from Sir Charles Metcalfe that the bridge at the Victoria Falls, which was linked up on April 1, will be completely rivetted, painted and finished by the middle of June. Railway trucks are already being taken across the bridge with permanent-way material for the line northwards.

NOTES AND COMMENTS.

THE National Gallery in Edinburgh was visited by 61,156 people during the past year. In addition there were 4,096 who paid for admission. The friends of the late J. THORBURN ROSS have presented his oil-painting, *The Bass Rock*, and another gift is *Schule Scailea*, by Sir GEORGE HARVEY, a former president of the Scottish Academy. There were 16,724 visitors to the Scottish National Portrait Gallery, besides 1,189 who paid. The following portraits were given or bequeathed:—Principal W. CUNNINGHAM, by Sir J. WATSON GORDON; Professor SYME, the surgeon, by G. RICHMOND, R.A.; Sir NOEL PATON, R.S.A. (marble bust), D. O. HILL, R.S.A. (marble bust), HERBERT SPENCER, by H. VON HERKOMER, R.A.; Sir CHARLES NAPIER, by G. JONES, R.A.; SAMUEL SMILES, LL.D., by Sir G. REID. Portraits have been purchased of Sir HEW DALRYMPLE, Prince CHARLES EDWARD STUART, the Duchess of ALBANY, Cardinal YORK, JOHN CLERK, Lord ELGIN, JOHN PHILLIP, R.A., Sir WALTER SCOTT, Sir PETER YOUNG, Sir WILLIAM CHAMBERS, architect. The following portrait-statues have been placed in niches:—GEORGE BUCHANAN, JOHN, Duke of ARGYLL, the poet BARBOUR, Cardinal BEATON and ADAM SMITH. The expenditure on the institutions in charge of the Board of Manufactures has been 10,297*l.* during the year.

A DECISION which was given a few weeks ago in the Supreme Court of the United States would appear to be fatal to all decrees of trade unions which fix the hours of working. It was laid down that "the general right to make a contract in relation to his business is part of the liberty of the individual, protected by the Fourteenth Amendment to the Federal Constitution. Under that provision no State can deprive any person of his life, liberty or property without due process of law. The right to purchase or sell labour is part of the liberty protected by this amendment, unless there are circumstances which exclude the right." The words sound well, but we doubt whether the judges anticipated that they would have any influence for good on workmen in general. An individual may occasionally hazard his employment if not his life by standing in opposition to "trade organisation," but he is regarded as a leper and is soon wearied of the unequal war.

ARTISTS about whom people have become oblivious occasionally obtain an opportunity of resuscitation. The latest instance is that of FRANCIS LEMUEL ABBOTT. He had a reputation in North-Eastern England as a portraitist, and had the honour to have Lord NELSON for a subject more than once. He exhibited in the Royal Academy, and several of his portraits were engraved. Over-anxiety about doing his work well and domestic trouble deranged his brain, and he died in 1803 in his forty-third year. Among his sitters was WILLIAM COWPER, and as last week there was an eulogising of the poet in East Dereham, and as relics of him were exhibited, including the portrait, ABBOTT's name could not be forgotten. In writing to his friend HAYLEY, he refers to what was for so retiring an invalid nothing less than an operation. In doggerel verse he says:—"ABBOTT is painting me so true, that (trust me) you would stare, and hardly know at the first view, if I were here or there;" and he adds, "I have sat twice; and the few who have seen his copy of me are much struck with the resemblance. He is a sober, quiet man, which, considering that I must have him a week longer as an inmate, is a great comfort to me." There is no letter expressive of the poet's opinion on the portrait, but one says that his dog wagged his tail on seeing it. He may have preferred the drawing in crayons by ROMNEY, to whom he addressed a sonnet. COWPER, when ABBOTT visited him, was engaged on his translation of HOMER, and he is represented seated at his desk holding a pen, his other hand resting on a volume of the

Greek poet. Towards the end of the year we may have a NELSON celebration, and the Royal Academy would be wise if in the Winter Exhibition some of the portraits of the hero which ABBOTT painted appeared on the walls. Although he was not an Associate, he deserves to be recalled to the attention of amateurs.

THE question of differences between drains and sewers is far too subtle to be determined by ordinary magistrates. Surveyors and lawyers do not always agree on the subject, and it is too much to expect private gentlemen should be more capable of coming to a conclusion. Portsmouth this week has been exhibiting the difficulties which such cases present. In case the Corporation repaired a drain which served five houses, and apportioned the cost among the owners. Some paid, others contended that by the Public Health Act of 1875, a drain was defined as a drain for one house; if more than one house was drained became a sewer, and was vested in the local sanitary authority, who should maintain it. The representatives of the Property Owners' Association argued that several houses drained into the pipe, it was therefore a sewer, and the prosecution were not, by the service of notices, entitled to recover the cost of the work of repairing the drain. The magistrates decided in favour of the Corporation. Another case followed in which a similar claim was made. The borough engineer admitted that the work he had executed was in connection with a public drain or sewer. The Corporation expressed willingness to abandon the claim for the houses, but not for the sixth. Judgment was given for the defendants, but they were refused costs. Evidently there were irregularities in the claims, but as justice differs the officials of the Corporation may be excused; they cannot determine between drains and sewers.

THE Manchester Society of Architects have for some reason remonstrated against a practice which is becoming common among officials of the Corporation. It appears that when plans are submitted by an architect for approval, any objection to the passing of such plans is communicated, not only to the architect, but to the owner of the building as well. The Council of the Society suggests that the officials who deal with plans should communicate with the architect only, at such time as the plans may be finally passed. Under the present method of procedure the client of an architect often receives a short notification simply stating that the plans have not been approved, and this creates in his mind an unnecessary feeling of alarm that the architect has not done his duty properly, whereas an objection may be one easily overcome at an interview between the architect and the Corporation officials. Copies of the letter were sent to the chairmen of the improvement and buildings committee and the paving, sewerage and highways committee. The former committee are considering the matter; the latter say they will continue the practice to communicate only with the professional (architects or others) who may have sent in plans for the committee's approval. Manchester is not the place where the practice exists, and as it has no adequate tag there should be no difficulty in abolishing it.

THE ROYAL ACADEMY.

the close of the banquet at the Royal Academy on Saturday the President delivered the customary address. Sir E. J. Poynter said:—I shall endeavour to draw your attention with as brief a reference to the action and affairs of the Royal Academy during the year as is possible in the time which I have at my disposal. The interest of the public in our Academy lies in our elections, our summer and winter exhibitions and schools. You need not fear that I intend to enlarge on all these subjects. But our recent winter exhibition calls for more than a passing notice, in that it formed a memorial exhibition of our late member, G. F. Watts, included a large selection of his works not already in the galleries. It is, I think, universally acknowledged that Watts stands in the front rank of the greatest English painters—to my mind he is in some respects the first of all in the higher sense, the severe beauty of the epic and of the great painters of the Renaissance, was a constant aim: or beauty in its other mood, the playful mood of the "Midsummer Night's Dream." In this sense beauty pervades all his work, while his portraits contain no temporary, fleeting or accidental characteristics, have the deep penetration of Titian and Rembrandt, who have the souls of men through their eyes. The theme on which, but that I should try your patience, I could not enlarge. To do justice to Watts's art demands a more or an article, and what I have said is very inadequate. The Academy mourns his loss in the same sense as the great public—as an artist of exalted aims holding up the great traditions of art. As a member Watts retired ten years ago, and he was always too absorbed in his work to take much part in the affairs of the Academy. Personally he felt that if an artist is to fulfil his mission to the world he must shun all distractions either of amusement or business, and he steadily avoided all those influences so alien to the work of the artist when he becomes a public man. Temperate in his living to an extraordinary degree, he preserved a somewhat frail body with such prudence that his power for strenuous work never failed him to the extreme limit of his long life of eighty-seven years. In this he was aided by the loving attention of a wife who may be said to have taken the part of Love in his own great allegory, the greatest and most touching, perhaps, that was ever painted, the allegory of Love and Death, and by her devotion have kept the grim figure at bay for some twenty years. It has occurred to me that in view of the importance of the collection of the pictures of this great artist which he gave to the nation, and which are preserved in the Tate Gallery, that his memory should be perpetuated by a statue responding to the statue of Millais, which His Majesty the Prince of Wales did so much to encourage. His Royal Highness the Prince of Wales has given his approval to this proposal, and has consented to preside over a committee for the purpose which it will be my duty to organise as soon as I have the leisure to do so. I cannot refrain from at least alluding to other losses which the Academy has sustained during the past year, and they have been many. Two of our oldest members—Henry le Jeune, who had not exhibited here for many years, and Frederick Odell, the celebrated painter of Oriental scenes—have departed from among us. Prinsep, brought up in the same house with Watts in his young days, and early associated with Millais, Rossetti and Burne-Jones, reflected in his work some of the best qualities of all these great painters. He was my own intimate and fellow student under the same master in Paris, and was welcomed everywhere among artists for his keen wit combined with a hearty geniality; he was a favourite with his colleagues, and loyal to the best interests of the Academy. Colin Hunter and Boughton were both artists of distinction and originality in their separate lines; and, finally, an early death has carried off Charles Furse, that brilliant painter who within the last three years had made great strides in his art, and whose loss at the opening of the last period of his career and within the first year of his election into this Academy has been deeply felt. His last and best work, now hanging in this exhibition, gave promise of further high development, and that by which he came into prominent notice two years ago—"The Return from the Ride"—we have fortunately secured for the nation out of the funds of the Chantrey Bequest. A festive occasion like the present is not suitable for any such controversial matter as the Chantrey Inquiry of last year; if I allude to it, it is only because I should wish to express in the name of those members of the Academy who attended the sense of the unfailing attention and courtesy which

Lord Crewe, the chairman of the inquiry—whom we hoped to have seen here to-night, but who at the last moment was unable to come—showed throughout the whole conduct of the inquiry.

I have already alluded to the St. Louis Exhibition, and the high place which British art took in that vast display. The work connected with such an exhibition is enormous, and the members of the Academy and representatives of the various art societies who formed the fine art committee will not forget the numerous and prolonged sittings during the summer before last when all the details were elaborated. I take this opportunity of thanking in the name of the committee those liberal gentlemen who consented to part with their works of art for the long period—some twelve months from first to last—during which they were needed. We are honoured by the presence of Colonel Watson, Chief Commissioner to the Royal Commission, who has just returned from St. Louis. Colonel Watson has been on the spot the whole time, and has been of the greatest assistance to us in forwarding the interests of the Art Section. And in this connection I cannot pass over the services of our honorary secretary, Mr. Isidore Spielmann, who for more than two years has given his energetic services to the cause. An important event in the world of art has been the opening at Aberdeen, in a handsome building, of a gallery of historical sculpture, due chiefly, I believe, to the exertions and liberality of Mr. James Murray, a townsman, also one of our guests to-night. Three of the members of the Academy paid a special visit to Aberdeen for the opening ceremony, and report in high terms on the completeness of the collection, on its admirable housing and its value for educational purposes. Coming to another matter, I cannot pass over without mention the great liberality of those gentlemen and one lady who contributed large sums towards the purchase of the so-called "Ariosto," by Titian, now in the National Gallery. But for these generous donors—Lady Wantage, Lord Iveagh, Lord Burton, Mr. Astor, Mr. Pierpont Morgan and Mr. Alfred Beit, and, I may add, the Chancellor of the Exchequer, who made up the deficit from the public purse—this celebrated picture would now certainly be reposing in a famous private collection at Boston. I will not weary you with going into further details of events, but one point personal to myself I may perhaps be allowed to refer to—my position as director of the National Gallery, which came to an end on December 31 last. I will only say that it was a great grief to me when the time came that I had to leave the work with which I had been associated for nearly eleven years, and to part from the pictures and the galleries under my charge, which I loved to the point of almost feeling that they were my own property, but everything must come to an end and so must this speech. I thank you for the kind attention which you have given to my words.

AMERICAN BANKS.

A SPECIAL number of the *Architectural Review* (Bates & Guild Company, Boston) has been published which is devoted to banks. Many photographs and plans of American examples of all varieties are given. From an article on the "Planning of Bank Buildings," by Mr. Philip Sawyer, we take the following:—In considering the general plan of any of these institutions, the widest difference is observed in the point of view of the officers, some feeling that the tendency toward allowing the public to come in contact to a greater or less extent with the whole body of clerks is a relic of the old conditions where most of the bank's business transactions were personal and individual; that this is a thing of the past, and that it is now desirable that the public do business with as few officers or clerks as possible. From these ideas it follows that the banking-room should be of comparatively restricted size, the great body of workers being placed in other rooms disposed in convenient communication with it, and this plan has, besides the safety which results from separating the public entirely from the men keeping the accounts and writing the correspondence, the advantage of making the smaller banking-room less expensive, or of enabling a better show to be made with a limited amount of money. It is open to the criticism that, from the public point of view, the display of the working force is lost; the banking-room is comparatively unimpressive, however, and in one New York Trust Company at least, where the actual work of the institution is done on other floors, the public banking-room, in which the business is transacted for the most part by only half a

dozen individuals, presents an appearance which is at times lonesome.

Another point of view requires the banking-room to be as large as possible, even though the public is admitted to only a small portion of it and comes in direct contact with only the same few persons; that a gallery or point of vantage be provided from which visitors may see every clerk in the institution; that the long lines of bookkeepers' tables may make their impression upon him, and that he may overlook the various departments and hear the hum of all the parts of the great machine.

When an architect has built three banks he may feel that he has really obtained a grip on the subject, and he tackles his fourth with the idea that he can tell the banker what he should have, but when he has built a dozen he approaches the next one in a humble spirit, and is not surprised to see his well-studied arrangement turned upside down by the objection that, "This is a right-hand bank; the tellers go on the right of the entrance; they always have and they always will;" or, "It is all very well to have the receiving tellers near the main entrance, but we do not want the paying tellers near the entrance at all; they must be in the back of the room as far away as possible;" or, "You have provided no cage for the D. and H. Railroad; it will have to be placed in connection with the general bookkeeper, and must have a widow to the money clerk and another upon the public space."

It sometimes seems that no other type of institution transacting approximately the same character of business varies so much in its methods as do the banks, each of which has, presumably, worked out its own system in accordance with the pressure of its individual requirements and needs.

In all these institutions the vault is of great importance, even though it is simply a strong box carrying temporarily the securities and cash needed in each day's business, and giving over each night to a neighbouring vault of greater strength its contents. But usually it protects, year in and year out, sufficient value to make its contents interesting to cracksmen, and to the banker and public as well. Ten per cent. of the cost of the building frequently goes into the vault, the bank and safe deposit requirements being combined for the greater economy of construction and protection.

In considering such a vault, we find its width to depend upon the number of its aisles, each lined upon either side with tiers of boxes; its length to depend upon the combined requirements of the safe deposit receptacles and the space made necessary by the business of the bank. Infrequently, the interior of such a vault is two storeys in height, the intermediate floor being constructed of light open gratings, the tiers of steel boxes and the metal lining giving one the impression of being in the engine-room of a liner.

The usual type of vault has, however, but a single aisle, 4 feet wide, with boxes 2 feet deep upon either side of it. If, now, the door to the safe deposit space is in one end of this vault, the door to the bank's space in the other, and the two compartments are separated simply by a light steel partition with an emergency gate, the danger of a lock-out is averted and the protection of the vault simplified. Although it is by no means invariably done, a vault should be protected, no matter how thick its construction proper, by a casing of concrete, and, if this concrete contains in addition a fence of steel gaul-rods, set close together in a double row, staggered and run through a number of heavy timbers, a high degree of protection is provided, since it will require some hours of heart-breaking work with the cold chisel before an electric arc can be used to attack the vault itself.

The watchman in making his rounds should be obliged to pass behind the vault and to look under it and over it. To accomplish his passage he should be required to reach a watchman's clock-station at the furthest angle, and if, as is usual, the vault is supported upon a tier of beams, open between and lit by incandescent lights at the far end, he can readily look between them. His passageway is usually depressed or stepped down in order that he may do this, and mirrors are placed at an angle overhead that he may without difficulty see above. One New York bank has in the outside of its granite base a bronze escutcheon which, being unlocked and lifted, gives a view, pierced diagonally through a dozen feet of masonry, of the combination of the vault, and the outside watchman in passing is able to see from the exterior whether the vault in the basement is safe.

One is often desired to place a vault where it will be seen by the passing public, and this is supposed to give a

high degree of protection in itself. The president of a New York institution told me recently, however, of having been locked out of his bank vault. It was in the rear banking-room, the front of which was glass, and he went directly upon the level of an up-town street, unquented at night. It took a good many hours, needless to open the vault, and he told me that during his (which occurred one Sunday evening) he was amazed to see the crowds stream by, paying no attention whatever to the door of the vault, and the brilliant light in the rear of a dark room. He held me ready to explain at any instant the lawfulness of the proceeding, but no one asked an explanation, although the work was of a sufficiently suspicious character to make the president himself feel apologetic.

We have also the electric protection, which we afford to be without, and our only quarrel with it is with the unnecessarily hideous doors, akin to the cheapest furniture, with which the beautiful vaultwork is covered.

In discussing the relative merits of systems of protection, a New York expert once said that, when the first company for electric protection was organised in New York, vault makers were much antagonised, and both claimed that the others' work was useless. The expert added, however, "We have all shaken down now; we have the best vault that we can afford; we secure electric protection; we hire a trustworthy watchman, and the man has a yellow dog, and," said the old man, "when said and done, I am not sure the yellow dog isn't the end of the combination."

But it is really the smaller country banks which have the most need of protection, since they carry at times sufficient cash to make them very inviting, and yet cannot afford heavy, expensive vaults constructed for the larger institutions. Several curious devices have been put upon the market to supply their needs. One, I remember, consisted of a cylindrical cash receptacle, the interior of which revolves upon an axis, something after the manner of the patented safes. This is operated by a pedal, and once closed, cannot be reopened except by keys carried by the other officers. This engine is supposed to be operated by the business at the beginning of the day. Whenever the teller finds himself covered, he throws up his hands, butts his head on the pedal and is thereafter powerless to handle the cash. I have never met this apparatus in practice.

A more interesting suggestion is to lay an underground conduit from the village bank in, say, two different directions—one wire to an alarm-gong in the office of the hotel and one to the house of the cashier or president. In the event of a day attack the teller has some chance to protect himself without sacrificing his life.

It is interesting to know that there is a season for closing little banks and a fixed routine for doing it. In November we were told, "Look at the papers, you will see the country banks popping all over the Middle West." One does not see at once just why this should be, but it is quite simple. During the summer window open, people are out at all times of night and the vault is altogether too public. In the winter it is too cold there usually is snow upon the ground, which is a disadvantage. In the spring there is comparatively little money in the banks. There are left, therefore, those nights in autumn when it is cold enough to keep people indoors, not yet cold enough to snow, and when the banks are in their plethoric condition.

I have not mentioned what is perhaps the greatest protection of all—membership in the American Bankers' Association.

As this issue shows, there has been a wonderful increase in the number of individual banks built during the last few years. The time is past when the greatest advantage could be secured by building a high building, and there has been bred a distaste among many bankers for getting into the real estate business. They feel that the expensive as the lower buildings are in the larger cities, the bank is better off without the care of an office building, and the result is an interesting reversion to the type of building which we started. Moreover, we are becoming more critical. We desire the improvements which are to be obtained only by building to meet in each case the individual requirements, and we are finding that the conveniences of arrangement now attained in the new buildings tend to such prompt efficiency and economy in the running of the bank as to facilitate to a considerable degree the transaction of business.

Moreover, the decisions made necessary by the rebuilding of the bank officers (in specifying the requirements for their new quarters) to study from every aspect their methods of transacting business, to observe newer institutions, and it enables them to look at their whole system from a broader and more progressive point of view, and to give rise to their improvement many points heretofore taken for granted.

Proper light can be provided for the workers, ventilation tends to keep them in a condition of health and efficiency is introduced, and room economised in a thousand ways which only modern construction and modern furniture and conveniences have made possible. Books are no longer carried laboriously to a book-vault at night, at the expense of time and wear and tear to their bindings, placed under the desks upon which they lie by day, and put into steel compartments upon roller shelves protected by steel doors, the whole lined with asbestos. But this again presupposes the modern building, with not only a steel roof construction, but marble or tile floors, and bronze steel throughout.

Cash and securities are no longer handled unnecessarily. Money is distributed in classified compartments with the tellers' or cashiers' counters in an omnibus which just fits the space. At night the responsible officer of this receptacle, sees it wheeled from his cage and put in his own compartment in the bank vault—the work of five minutes.

In many banks nowadays the midday meal is cooked, served and eaten by the officers and clerks in rooms provided for this purpose, and some sort of room for exercise and recreation placed in connection with the clerk's locker and toilet-rooms.

I have said nothing of design, and certainly the illustrations show a great deal of it, but I think we may all agree that in a bank building, more than elsewhere, one should value durability, dignity and simplicity. It should look its character—that of a business house in which the elements of security and solidity are emphasised. Necessarily a comparatively low building if it houses the bank alone, it should hold its own in scale and dignity with buildings on either side of it four or five times its height. It must be in style permanently acceptable, since it is built not for this year or the next, but for a long period of life.

THE PYRAMID AND THE SPHINX.

SEARCH for the exit of the King's Chamber in the Great Pyramid has, says a correspondent of the *Manchester Guardian*, just terminated successfully. The structure was first found in the early days of archaeological research by Colonel Howard Vyse between 1836 and 1838. Steps were taken to keep the passage open, and it was not obstructed again by the thick drift of sand. Through rediscovery the temperature within the Great Pyramid, present scarcely more tolerable than a furnace, will be sensibly reduced, and the vast interior will be better ventilated.

Mr. Covington and his party, to whom the success of the search is due, then turned to the exploration of the Queen's Chamber, the outlet of which was found by Weyland Dickson in 1872, only to become likewise closed up by sand in course of time. Acting upon the suggestion of Professor Flinders Petrie to confine the search particularly within the eighty-fifth course, Mr. Covington, though still far from attaining the object of his labours, encountered a roughly worked stone embedded in the hardened debris adjoining the King's Chamber. It was a triangular-shaped stone, broken into half pieces, measuring together 16 inches by 16 inches by 11 inches, and bevelled on two sides. A tenth part of a circle of 18 inches diameter is carved on the dressed surface. It is conjectured that the stone was let into the Pyramid casing to be used for astronomical purposes. The discovery is chiefly interesting on account of this being the first known instance since that recorded by Herodotus of any character-bearing stones found in the Pyramids.

The scheme for clearing the bases of the Sphinx from sand in which they are buried is beginning to assume a definite shape. The committee already formed is to meet a few days to discuss ways and means. It is thought that the Prisons Department will provide 200 labourers from among the male inmates of prison establishments. The workmen will receive a small wage from the excavation committee. By carrying the trench from the paws of

the Sphinx in a south-easterly direction, instead of due east, neither cultivation nor personal property will be molested, and the cost will therefore be enormously lessened.

IRISH SURVEYORS' INSTITUTION.

THE annual general meeting of the Irish branch of the Surveyors' Institution was held on the 27th ult. Mr. Thomas Courtney Townshend presided.

The report dealt largely with the position of agents in connection with the operation of the Land Act of 1903, and while commenting with satisfaction on its development to an extent beyond the most sanguine anticipation of the many parties vitally interested in its successful working, by the completion of purchase agreements representing an area and rental of vast magnitude, yet the committee view with apprehension the serious position brought about by the probable delay of several years before the purchase money of such estates can be distributed, owing to the Treasury regulation limiting the advances to five millions a year. This partial block in the working of the Act is also detrimental to every other interest involved in the transfer of land in Ireland, and the Institution desires to press upon the Government the absolute necessity for increasing the funds available for the purposes of the Land Purchase Act. The report concluded with a reference to the great value the Institution continues to prove to its members in providing a basis for common action, and affording representation to a profession which would otherwise be without the necessary elements of union.

The Chairman, in moving the adoption of the annual report and accounts, briefly made reference to the successful work of the committee during the year in regard to matters closely affecting the interests of members, arising out of the administration of the recent Land Act, and made grateful acknowledgment of the kind manner in which claims of land agents for remuneration for negotiating sales of estates and compensation for loss of employment have been met by the great majority of the Irish landlords.

The adoption of the report was seconded by Mr. Robert McClure and was unanimously carried.

The results of the recent professional examinations held in Trinity College, Dublin, qualifying for admission to the Institution, were then announced, the successful candidates being as follows:—Associateship examination, Charles Knox Fowler; students' examination, Charles J. Duggan and Creighton C. Dunlop. The results of two other candidates who took the English course in the surveying section will not, however, be made known until next month.

Mr. Frederick A. B. Turner, Gorey, was unanimously elected chairman for the ensuing year, and Mr. Robert Sanders vice-chairman.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE annual general meeting in connection with the Edinburgh Architectural Association took place on Wednesday in last week. Mr. Harold O. Tarbolton, the president, presided. A vote of thanks was awarded to Colonel More Nisbett for permission to visit Drum House, Gilmerton, and a similar compliment was paid to Mr. Hamilton More Nisbett for acting as leader on the occasion of the visit. Reports by the conveners of the various committees having been given in, office-bearers were appointed for the ensuing season. The following officials were elected:—President, Mr. H. O. Tarbolton; past president, Mr. A. Hunter Crawford; honorary secretary, Mr. Colin B. Cownie; and honorary treasurer, Mr. Glassford Walker. Prizes in the associates' section were presented as follows:—Design for a country house—1, Allan K. Robertson; 2, W. G. Walker Todd; and 3, A. Wilson. Design for a screen wall, with side porticos—William Wands. Design for a font and font cover—G. Craston Blechynden. Entrance lodge and gateway for country house (apprentices' competition)—1, D. J. Chisholm; and 2, J. Craston Blechynden.

The President then delivered his valedictory address. Speaking of the position of municipal bodies with regard to public works, he said that as that kind of work involved grave interests of an artistic, practical and financial nature, it was essential that the services of only properly trained and experienced architects should be retained. Architectural work should not be placed in the hands of engineers and surveyors, and the work of the official architect should

be restricted to structures of secondary importance, all buildings of a monumental character being entrusted to independent architects, selected in such a way as might seem best to the local authority concerned. With regard to assessors in public competitions, Mr. Tarbolton said that the difficulty lay in the haziness which surrounded the position of an assessor. His duties were certainly prescribed, but there was no recognised rule as to the terms of his employment. He had no stated fees, and the large accounts which were frequently sent in by assessors had naturally frightened many who would willingly seek their assistance. Some clear definition of the obligations of assessorship was wanted. He thought the difficulties might be obviated if the Institute were to appoint a competition committee drawn from its own body and the various allied societies throughout the country. The duty of such a committee would be to examine competitive drawings and to give awards upon the same. This would encourage promoters of competitions to make these bodies their referees. He recommended the appointment of either three or five assessors instead of one, in which case the award would not only be more final, but would remove the tendency to play up to the idiosyncrasies of a single assessor, whose predilections for certain types of architecture might be well known. Referring to the question of monumental sculpture, he said that in countries where sculpture thrived more happily than in our own, statues were seldom placed in the open. They were placed upon the sides of places of moderate size, and when so disposed as to get value from background, whether of stone or of vegetation, they gained vastly in effect. The statues in Edinburgh were invariably placed in an unfortunate position, as if merely dividing the lines of tramcar or other traffic. Alluding next to the ownership of architects' drawings, Mr. Tarbolton said that that was a matter of great importance. He took it that all architects were agreed that unless a special agreement had been arrived at, the client paid for a concrete result, and that the drawings prepared were only the customary means employed by architects for illustrating their ideas for the benefit of the workmen. As such the client had no more right to them than he had to the architect's office materials. He could hardly find anything quite analogous in other professions. The question recurred again and again in the Courts, and it still awaited some final settlement. He did not hesitate to admit the right of a client to the possession of any plans of a pictorial or sketchy nature prepared primarily for the client's benefit, but he did strongly dispute his right to demand the mechanical apparatus set in motion to give certain tangible results.

The President was cordially thanked for his address.

THE BRITISH SCHOOL AT ROME.

UP to the present time, says the correspondent of the *Morning Post*, the British School has had two directors, Mr. G. McNeil Rushforth and Mr. H. Stuart Jones, each of whom has held office for the term of two years, or rather seasons, for the archæological season here is of about six months' duration. Both of these gentlemen are scholars of taste and erudition, and it has not been their fault, but rather that of the school's financial condition, if their institution lags far behind the other archæological establishments of Rome. In the first place, Roman residents hold the view that two years are far too short a period for an appointment of this kind. Professor Petersen, who has just retired, and his colleague Professor Hülsen, of the German Institute, have spent not two but twenty years studying Roman archæology on the spot. Monsignor Duchesne, of the French School, has himself become one of the regular institutions of Rome, and his great reputation, built up by years of patient labour, casts lustre upon his country's archæological school and French scholarship. Mr. Richard Norton, of the American School, has also been some eight years at his present post, so that the British School is unique in having adopted the principle of a biennial directorate, which, in point of fact, means only twelve complete months spent among the ruins of antiquity. It naturally follows that, whereas the other three directors make Rome their home and settle down here, the British director regards himself as a bird of passage, a diplomatist of archæology, who is in Italy one year and in Oxford the next. A further result of this system is that it is less easy for him than for his colleagues to gain the friendship and acquaintance of prominent

Italians, and thus to obtain an insight into the present of the country whose past he is studying, without archæology, like history, must naturally remain a letter instead of being a real thing. It was not merely by studying archives but by mixing with the people that Gregorovius was able to make Mediæval Rome live for his readers. It was because Curtius knew from personal experience the blue bays and bare mountains of Greece those who lived and moved in her towns and villages, he threw new light upon her ancient history. The reason such lectures as those of Dr. Dörpfeld at Athens are so luminous and so fascinating.

The reason for the biennial directorship is, of course, to be found in the lack of funds. If it takes seven years to become an attorney, it requires no less time to develop a really competent archæologist, for there is no shorter so complicated a subject, which requires, too, taste as learning, and should, whenever possible, involve the study of lucid and agreeable exposition—a gift common perhaps, in France and Italy than in some other countries. But we cannot expect men over thirty, possibly more probably engaged in teaching work, to settle down for a long period in Rome for the exiguous salary of 2000*l.* an apartment, which are all that the director of the British School receives. Archæology is not a lucrative profession, at least of all in England, where learning is apt to be remunerated much as it was at Rome in the time of Julius Cæsar, and where there are few, if any, openings to an archæologist, who has long expatriated himself. Therefore, the director happens to be provided with external equipment of private means, which even Archæology took into account in his views of human affairs, he will be likely to remain long in the Palazzo Odescalchi at Rome, year when he could be making more by lecturing to his graduates at home.

But the lack of funds does not affect the directorship; it also cripples the library. The British School is of course young, and libraries cannot be improvised by a stroke of the pen if that pen have not a good bank balance behind it. But for purposes of study the library of the school is absolutely inadequate. It does, indeed, possess many of the classical texts, but its dimensions are not as large as those of some private collections, and for students of the Middle Ages it is absolutely useless. The patriotic student is apt to be somewhat humiliated when at a lecture at the school all the books and illustrations have to be lent to him; recently happened—by the courtesy of the German Institute. Indeed, if it were not for the unfailing kindness of that admirable establishment the British student would have to seek in the Vittorio Emanuele Library for the mental nutriment which his own school cannot supply, the 50*l.* a year spent on the library, reasonably be expected to supply.

But in spite of its two volumes of "papers," its occasional lectures and the success of Mr. Stuart Jones in obtaining leave to catalogue the ancient sculptures in the municipal museums, the British School is so handicapped by want of funds that it naturally compares unfavorably with its older and wealthier rivals. The American School, with its 10,000*dols.* a year, the French with its 1,540*l.* and its expenditure of 240*l.* a year for its library alone, the German Institute with its share of a still larger sum granted by the Reichstag for the branches in Rome and Athens are, of course, in a far better position than the British School with a total income of 2000*l.* all told. Under these circumstances it is thought by some that unless the income of the British School at Rome could be raised—and that cannot well be done by subscription, which are not likely to increase—it would be better that it should come to an end and that its funds should be devoted to the use of the school at Athens, which is none the less well off, though it has a Government grant at present of 500*l.* a year. The Athens School has, of course, the great advantage of being able to make excavations in addition to the superior interest of Greek over Roman archæology. But Mr. Stuart Jones lately drew attention to a fact, unknown to many Italians, that there is nothing in the Italian law to prevent excavations being made by foreigners in the country, provided that leave be obtained from the Government. As the Herculaneum question has shown, however, it is not easy to get such permission, and Italian susceptibilities are very easily offended and national pride aroused. Sites, indeed, there is no lack; Magna Græcia is all virgin soil, and much of the Campagna still retains secrets.

The preservation of the Roman School is not, it may

d, solely an archaeological question. These institutions add very considerably, if conducted on a suitable site, to national prestige—witness the increased esteem in which the United States are held in Greece since the large excavations at Corinth were undertaken by the American School. Our own school at Athens, under the guidance of the present admirable director, Mr. Bosanquet, has become as well as a scientific centre, second only to the Louvre, where Greeks meet Englishmen, and all persons of culture and intelligence are made welcome and interested in the work of the school. Such, under favourable conditions, might, on a lesser scale, be the position of the school at home. But that is largely a question of finance.

THE MANCHESTER INFIRMARY.

DIFFICULTY has been created between the Manchester Corporation and the Infirmary Board concerning the surrender of the site of the existing building in Piccadilly. At the beginning of March the sub-committee referred to the Board complaining that the latter body "do not appear to give any consideration to the needs of the Corporation in respect to the building operations which are now in contemplation." In reply the Board forwarded to the sub-committee on March 27 the following memorandum:—

The Board of Management of the Manchester Royal Infirmary desire the special infirmary site committee of the Corporation to be fully informed of their proceedings in relation to expediting delivery of the Piccadilly site, and therefore submit for its information the following record, showing how constantly that object has been kept in view. The instructions to architects competing it was notified "the Board desired to complete 300 beds as soon as possible." In the report of the building committee recommending the plans to the Board, and adopted June 20, 1904, the Board were recommended to let the foundations separately, so as to complete the work at an earlier date.

At the meeting of the building committee, August 4, 1904, Sir James Hoy suggested that the committee should consult "the architects as to whether the contract might be let as to allow of a portion of the building, say, for 300 beds, being erected in order that vacant possession might be obtained by the Corporation one or two years before the completion of the structure in its entirety," when it was resolved, "That a copy of Sir James Hoy's letter be forwarded to the architects for their consideration and report, the chairman undertaking to write and impress the importance which the committee attach to expediting the release of the present site at the earliest possible moment in view of the financial question and of the undertaking entered into by the Corporation."

The architects attended the committee, when this correspondence was read and discussed, as recorded in the following memorandum:—"The architects expressed the opinion that the completion of the new infirmary would be expedited by proceeding with the whole of the buildings rather than by sections, and Mr. Hall stated that in his opinion the buildings may be completed in about three and a half years, or at all events in four years, from the date of commencing the foundations."

At the meeting of the building committee on November 15, 1904, the chairman submitted a memorandum as to the possibility of expediting the removal of the infirmary from the Piccadilly site, and remarks thereon by the architects.

On February 14, 1905, the chairman of the building committee called upon the city architect and explained the steps the infirmary was taking, and intimated that the building committee would gladly consider any practical suggestion he might be able to make for expediting the occupation of the new hospital.

On March 6 a special committee considered a suggestion for building a temporary hospital of 300 beds, and after careful consideration decided that such course was not compatible with the interests of the infirmary.

Appended to the memorandum are the letters which passed between the chairman of the building committee (Mr. Hopkinson) and the architects at various dates. The last letter was from Messrs. Hull & Brooke on November 4. It stated that while it would be possible to occupy the hospital before the teaching block was completed, they saw no reason why this block should not be completed at the same time as the others. They were of opinion that it would cause grave inconvenience not to have the administration building

erected. As to the nurses' home, it would be very costly to provide temporary accommodation by dividing up wards into cubicles and sitting-rooms, and other temporary accommodation would, if provided on the site, interfere with the carrying out of the rest of the works. "As a matter of fact," they added, "the quickest way to do a big hospital is to get your administration buildings all done before you complete your wards. We do not think that the postponement of the completion of these two blocks (administration and teaching) would expedite the completion of the rest of the hospital by six months or anything like it."

The sub-committee of the Corporation on April 20 instructed the town clerk to address the following letter to the board of management:—"Your letter of the 27th ult. and its enclosure have been submitted to and fully considered by the special committee of the Corporation *re* Royal Infirmary. They do not, however, find that the memorandum enclosed in your letter affords a sufficient answer to the statements contained in my letter of March 7 last. It is true that the memorandum shows that the board of the Royal Infirmary are acting under the advice of their architects, with the result that all idea of providing 300 beds in the first instance has been abandoned. The committee learn from the city architect that information is from time to time afforded to him as regards the progress of the works, but these communications cannot be regarded as affecting the attitude of the Corporation in reference to the matters referred to in this correspondence."

USHER HALL, EDINBURGH.

THE report of Sir Aston Webb, R.A., who was asked by the Town Council of Edinburgh to report on the acoustics and general arrangements of the Usher Hall as designed by the city architect, is now in the hands of the committee, who will consider the matter at an early meeting. It is understood that Sir Aston Webb condemns the proposal to have the hall surmounted by a dome, and generally he considers the hall too long for its width. He makes a suggestion that the hall should be oval in shape—a proposal which would, if adopted, mean the abandonment of the advantage of utilising the present foundations. It is unlikely, says the *Scotsman*, that the committee will seriously consider this suggestion, which Sir Aston Webb himself advances as one that the circumstances may render impracticable. With the removal of the dome the plans will require to undergo radical alteration, and the façade would be changed to something like the original design. The plan at present under discussion involves the entire demolition of the present Synod Hall down to the foundations. It is the view of some members of the committee that that would be the better plan to adopt, as, in their opinion, any adaptation of the present hall, however economical it might prove financially, would not in the end prove satisfactory.

W. ETTY, R.A., AND YORK MINSTER.

AFTER the fire in York Minster, when the works of reparation were about to be undertaken, some of the people who had known and loved the Minster from their childhood were alarmed by the threatened emendation. An opposition, conservative in the better sense of the term, was started among the subscribers, which daily grew in strength, and much irritation was caused. The subscribers complained justly of breach of faith, insisted on the purpose for which the fund was raised, namely, restoration, not mutilation, reminding the Dean and Chapter of their original declaration, "that they would not depart from a model more excellent and beautiful than anything they could substitute in its place."

Among the most zealous of these subscribers, says the *Yorkshire Herald*, was Etty. To his "surprise and consternation," finding himself an unwilling partner and contributor to a crime in his opinion second only to that of the "wretch who fired" the Minster, he vigorously bestirred himself and arrayed available friends in opposition to the scheme. He penned indignant protests for the newspapers, York and London, private expostulations—giving amicable forewarning of possible ill consequences to himself—with Smirke, son of an old friend, prosaic son of the imaginative illustrator of "Don Quixote" and the "Arabian Nights."

This opposition silenced the projectors for the time; but

as we shall see it was renewed later, for in 1830 the defeated party brought the subject up again, and a meeting was called for December 28. "A Mr. Vernon Harcourt, 'residential canon,' man of family and influence, relative of the then Archbishop, was the moving spirit of destruction."

Etty, we read, was "heart and soul" in the cause of opposition. "He set on his friend Sydney Taylor, editor of the *Herald*, to fire off 'great guns' against the destroyers; wrote renewed remonstrances to the infatuated dilettanti, repeated letters in the *Morning Herald* and in the Yorkshire papers."

To him "the finest choir in Europe," he bursts forth in one of those (to the *Yorkshire Gazette*, December 18, 1830), "with all its majestic accompaniments, was laid in ashes; we thought the measure of our calamity was full. We were mistaken, heavier doom hangs over us. That gorgeous screen—the admiration of all who beheld it, that noble screen, which escaped the fire as by miracle—is destined to be torn from the foundations on which it has stood for three centuries—broken up and mutilated it must of necessity be—is to be placed where it must, from the situation of the windows, be mostly in shadow, and some of it entirely lost."

"This is not all. That noble choir, of which this noble screen forms the gate—and, like the 'Beautiful Gate' of the Temple of Jerusalem is the opening only to greater beauty, greater splendour—that noble choir is destined to be curtailed and cramped in its lengthened (? length) and its grand proportions—leading from the gate to the distant steps, from the steps to the altar; then the light and elegant altar-screen; another graceful withdrawing space behind—the 'Chapelle of our Ladye'—and, towering above all, at the end the east window, like a splendid mass of diamonds, rubies, sapphires and emeralds, forming altogether a *coup d'œil* unequalled in the world. I am proud to say I have seen many of the finest cathedrals in Europe; I never saw one equal to it. All this is to be 'improved'—the cant phraseology of the day—that is, spoiled by tasteless, unfeeling innovators. All the feeling of auld lang syne brought down to the steam, gas and 'iron age' of the nineteenth century. God forbid the vile attempt, and save our noble building from ruin. Were I, Mr. Editor, to offer to repaint the cartoons of Raphael or the 'Last Judgment' of Michel Angelo should I not be justly regarded by the world of art as a madman, an imbecile or a most presumptuous coxcomb? Certainly I should. The case is a parallel one. York Minster is as perfect in its kind, and even more so, than the works in question are of the same epoch, the fifteenth century; has the same sacred antiquity to make all but vandals venerate and hallow it."

"We learn, too, that in a letter to the *Leeds Intelligencer* his opinion as an artist is given as coolly as his great love and enthusiasm will allow. Why, why, the proposed alterations by nineteenth-century amateurs on the work of artists of the fifteenth is 'as a matter of taste' a blunder. The mutilation—from the intricacy and elaborate ornament of the screen, necessarily involved by its removal, notwithstanding what may be said to the contrary—would be the least part of the injury to our cathedral. The fatal blow to its grandeur would be in the choir, that 'mighty heart' of our temple. Imagine 20 or 30 feet cut off its majestic length. Grandeur and magnificence arise not only from a just proportion of parts to each other, but also not a little from length and magnitude. 'The long-drawn aisle' Milton alludes to as an image of grandeur, which he knew how to appreciate. The advocates for the measure tell you the choir will not be shortened. What is lost at the west end is to be taken off the 'Ladye Chapelle.' Believe them not. The length of the choir is from the present organ screen to the grand east window. Any diminution of that noble length would be a diminution to the eye. . . . All who recollect the Divine place as it was before the fatal blow by the cunning and cowardly assassin—who thus robbed the place of millions—must have been forcibly struck with the grand and noble proportions these arrangements of distance and effect had on the mind, and consequently the heart, lifting up the imagination and feelings to Him who made us. Cut off the space proposed you throw back the altar 20 feet at least under the east window. The altar, or rather the light transparent altar screen, now forms, as it should, a prominent and delightful medium between the choir and that splendid mass of light and glory. Put the altar under the window, and the matchless beauty of these parts is destroyed and unilluminated. The Arab proverb says, 'Under the camp it is dark.' Under that splendid window the beauties of the altar, which I and all must have admired, will be eclipsed instead of

assisted and illumined. In short, the whole harmony and grandeur of the choir will be overthrown."

"Pause, then, my friends and countrymen, ere you give your sanction to this deed. 'Let well alone.' The choir was pleased, we were pleased, as it was of old. The centuries are not to be despised."

Gilchrist says:—"But for the Yorkshire painter's love of Gothic art, his persevering efforts to animate and sustain local and even a wider feeling against the vandals, it is probable the lover of antiquity would have mourned the most interesting remnants of Mediæval art remaining to an English church."

"He was warmly seconded in London by Sydney and Cottenham, in York by his friend John Brook and adherents of auld lang syne. In the end a crowd of Minster's real friends rallied round the standard of faith, amongst them great names and families—Cholmondeleys, the Yarboroughs, Lord Feversham, Duncombes, the Wynns, Fairfax, &c. If the choir persisted in they agree to demand back their wrongly appropriated subscriptions and so cripple the innovation."

At a meeting on the question on December 28 both sides claimed a victory. Then we read that an appeal was made to the Archbishop and also the king (William IV). Eventually the Dean and Chapter gave way, and the choir's friends saved the screen."

TESSERÆ.

Gothic Geometrical Planning.

MANY architects scout the idea of proportion in buildings altogether. They say that it is useless to design the building on paper according to strict geometrical rules, as the foreshortening in perspective and the differences of planes will destroy the proportions in execution; but, on the contrary, we know that Greek and Roman buildings are equally satisfactory in drawing and in construction. There is no good architecture without good proportion, for without proper proportion architecture is no architecture. All the best buildings of the Gothic period, such as St. Chapelle, Amiens, and the cathedral of Lausanne, were designed on certain principles of proportion, and this can be proved by measurement. This fact has attracted the attention of many eminent architects and writers on architecture. The first to draw attention to it was Cæsar Cesariano, the translator of "Vitruvius," who proved clearly that Milan Cathedral was designed on the lines of a combination of squares and triangles. This idea was developed by Kerrich in a paper in the nineteenth volume of "Archæologia," who applied the form of the *vesica piscis* to many ancient examples of great success; to the plans of Bath Abbey Church, Exeter, Lincoln, Hereford, and other cathedrals and churches. Hawkins, in his book on "Gothic Architecture," published in 1813, recapitulated the evidence in favour of the system of proportion. Professor Cockerell, in a paper read at the Winchester meeting of the Archæological Institute, showed that the *vesica* gave William of Wykeham the guiding principle for the plans of his chapels, but he found that the equilateral triangle did not apply to the sections of all the chapels. The Lincoln volume of the same Institute there is a paper by Mr. Penrose on the "Proportions of Lincoln Cathedral," which he proves to have been originally designed on a system of squares called *pariquadrats*. But Viollet-le-Duc in his essay shows conclusively that trials of various forms characterise generally the buildings of successive periods. In the round arches of the rectangle was used; in Early Pointed, what he terms the Egyptian one, in which a perpendicular line drawn from the apex equals $2\frac{1}{2}$ parts to 4 parts of the base; in later periods the equilateral triangle together with the Egyptian. He applies his system to many of the churches he had opportunity of measuring when engaged in work of restoration. In the church of St. Sernin at Toulouse—a noble Romanesque edifice with double ambulatory the interior of which strikes everyone who enters it on account of its fine proportions—he found that on dividing the ground line into 20 parts 5 of them gave the half width of the nave, 2 the thickness of the pier, 4 the width of the inner aisle, 2 the thickness of the second pier, 4 the width of the outer aisle, 2 the thickness of the wall and 1 the projection of the buttress. An Egyptian triangle, springing from the outer base line, gives the springing of the vault of the nave and the abacus of the arches of the aisle, and

lateral triangle opening from the centre of piers of the meets this in the centre of the arch and gives the of the nave arches. In the Ste Chapelle he shows two equilaterals give the slope of the arch over the ways, that another, based on the window sill, gives the ring of the groining, and that others govern the entire position internally and externally. He applies the principle to Amiens, Notre-Dame de Paris and es cathedrals, which latter he asserts was designed the lines of rectangles, and that this proportion here adduced from Romanesque tradition, which ed for a longer period in that part than elsewhere in

The West Front of Wells Cathedral.

arded in the right spirit, we shall wonder at the astible resources of the artist in delineating the is and opposite characters of his multifarious com- on, in which no two are to be found alike, and in each hich we find the appropriate idea, and the fulness of ment which sustains the *dramatis personæ* through- with an untiring energy of impersonation in costume, of and action which excites our warmest admiration. ave the sanctity of the monk, the meekness and ction of the supreme Pontiff; the archbishop; the energy of the bishop in the act of benediction; the ent abbot; the devoted anchorite; the haughty and ing king; the stark conqueror fiercely justifying his ation; the placid and impassible confessor administer- is good old laws; the lusty, but hapless "Ironside"; atrepid Harold encased in mail; the king, defender of faith, treading upon the fallen Pagan; the comely, ut prince and lover; the devout nun; the majestic n benefactress, who retired from the pomps and ies of the world; the lovely bride of Henry I., "the maid of Brabant," the theme of the troubadour; the red evangelist, or the malignant sprite; each and all vering a racy energy of conception which the informed may envy. And though sometimes pushed almost to ature, the better to explain the person in keeping with grossness of that day, these works contain beyond all t lessons to the artists of our times which ought not to elined.

Christian Art in Italy.

arly Christian art dates its origin from the Catacombs. re in secrecy and silence the pious feelings of the hippers found their appropriate expressions in forms, though they were, yet containing in them the germs future, surprising in its luxuriance and magnificence. on as they discarded the models of Byzantine art they n to advance gradually, yet surely. Each artist added a new excellence to the old standard, and the Christian ngs of great men soon manifested themselves in pious munificent encouragement of the skill of artists. A rkable unity in art prevailed until the close of the nth century, when linear perspective began to be rstood, and a more elaborate system of colour had been duced. Masaccio had by that time given a roundness relief to his forms, hitherto unattempted. Anatomy generally studied, others had introduced the landscape had learnt to represent the inanimate objects of nature e perfectly, until at last Christian art, being now strong igh to stand alone, undertook the important struggle its antagonistic principle, that of Pagan feeling and nement. To the Umbrian and Bolognese schools we t look for those who maintained the former in all its ty and purity; to the Florentine school, with all its derful genius and power, for those who undermined its dations by introducing a taste for Classical subjects. s was in a great measure owing to the state of learning he time, the style of education, the profligacy of the les and the ignorance of the lower orders. Against e evils the monk Savonarola waged a desperate war. great eloquence, his deep views, his profound learning delicate refinement of taste gave him an almost ounded influence with all classes. He was precisely man to head a popular movement, and certain of his aliarities to call forth a bitter opposition. He did effect eat revolution in the tastes and habits of the people, consequently in art, both directly and indirectly. In ice, indeed, art maintained a comparative purity until sixteenth century, although the enthusiasm for Classical jects was almost too much for the Christian poetry ch had lain in the hearts of the people, and Venice sted the inroads of naturalism longer than other parts Italy, it may be from the loftiness and spirit of devotion

joined to a strong feeling of patriotism and a love of the marvellous which animated the nobility, and thus helped to retain the purely Christian element to a much later period than any of the other schools.

Painting in Ancient Rome.

In the early-history of Rome few works of painting are at all alluded to. The first native artist of Rome whose name is recorded was Fabius, surnamed Pictor, who lived about 300 years B.C. Pacuvius is mentioned as a skilful painter, whose accomplishments as a man of science and a poet not only obtained esteem for himself, but went far to gain reputation for the art he practised. He was followed by Turpilius, a Roman knight, and, according to Pliny's account, a good painter, remarkable for the peculiarity of painting with his left hand. Near the age of Augustus, who was the first that enriched Rome with any considerable collection of pictures and had them publicly exhibited, there was a Roman painter of the name of Arelius, and after him Ludius, a painter of landscapes and seaports, who was much employed to ornament the town and country houses of the wealthy Roman citizens with trelliswork. Amulus painted among other things for Nero a gigantic portrait of that emperor, 120 feet high. It was done upon cloth, from the difficulty of preparing plaster of sufficient extent of surface, which circumstance is supposed to have given rise to the practice of painting on canvas. Historians mention Marcus Aurelius, and Labeo, the proconsul of Narbonne, as having sought amusement in painting. To these may be added Pinus and Priscus, which sums up the scanty catalogue of the native painters of ancient Rome. There cannot be said to have been any Roman style of painting, as nearly all the works done in Rome were the productions of Greek artists, who flocked to Rome after the conquest of Greece and its colonies in Sicily. The number of these was perhaps one powerful means of paralysing any talent for painting that might have sprung up among the native Romans. With regard to the specimens of ancient art that have reached our day, it may be remarked that of movable pictures, such as the finer works of the Greeks are recorded to have been, no vestige has ever come to light, and probably never can. This circumstance may be regretted but cannot be wondered at. As to the paintings and ornamental decorations that have been discovered at Herculaneum and Pompeii, it would be unjust to receive them as specimens of the ancient state of the art, as they appear to be mere copies by house-painters of existing basso-relievos. Many of them, however, display great ease and accuracy of outline as well as fine colouring, which, at the time of their being first brought to light, was as fresh as if only a few years had elapsed since they had been painted.

Bishops and Cathedrals.

It is almost needless to observe that the several portions of our cathedrals are popularly and very conveniently attributed to the bishops during whose respective episcopates they were erected. This is scrimp justice to the contemporary deans and priors, with their capitial brethren; still it has this advantage, that it invests what would else be dry architectural history with something of the interest of a personal narrative. And this interest is indeed one of those things which give so much pleasure to the ecclesiologist in his study, that he who first opened to us the full relish with which we follow out our architectural problem through all its branches of date, style, person and the rest, might well claim the reward offered so many ages ago, and never yet adjudged for the discovery of a new pleasure. For instance, it is something to know that "the nine altars" of Durham was commenced just as the cathedral of Salisbury was hastening to a completion; but it is fuller of interest to know that the same Bishop Poore who founded Salisbury, being translated to Durham, pursued at the other end of the kingdom his architectural tastes. We sigh to see both Salisbury and Durham destroyed by the ruthless hand of the same Wyatt. But there is something of an epic interest in the fact that what one bishop, first of Salisbury and then of Durham, perfected, another bishop, first of Salisbury and then of Durham, injured beyond all hope; as if Daines Barrington, the munificent, for so he truly was, must everywhere by some fatal necessity be the destroyer of the works of the no less munificent Richard Poore. There is also some pleasure in finding the same kind of work pursued by the same prelate in different places. Bishop Alnwick inserted the west door and window at Norwich. When we find the west windows at Lincoln and some surrounding work assigned to the same person, we seem to

see him rejoicing in his work, and sympathise with him in his self-complacency as he repeats it. One of the most exquisite fabrics in the kingdom, and one of most originality in the design, is the clerestory of the choir at Norwich. This is attributed to Bishop Goldwell; but Goldwell was Dean of Salisbury when Beauchamp, a much greater man, was bishop of that see. Beauchamp, as Archdeacon of Suffolk, had previously had a stall in Norwich Cathedral, and he had there built a chapel. Moreover, Beauchamp's reputation as an architect was so great that he was employed by Edward IV. in the rebuilding of St. George's Chapel at Windsor; and we may attribute the design of that other great work at Norwich to him, under the influence of his former contemporary at Salisbury, and thus associate the most singular part of the cathedral of Norwich with one of the greatest names in our architectural history.

GENERAL.

Mr. Percy E. Newberry has been commissioned to write a volume on the royal tomb of Yua and Thua, the parents of Queen Teie, the wife of Amenhotep III. and mother of the "heretic king" Akhenaten. The tomb was found by Mr. Theodore Davis on February 12 last.

Sir Charles Cameron, the medical officer of Dublin, when lecturing in Manchester on Friday last, advocated the general use of asphalt in foundations. He said that the Corporation of Dublin erected eighty-four tenements upon an ancient dumping-ground. He suggested covering the whole area to be built upon, together with the yards of the tenements, with a thin layer of asphalt. That was fourteen years ago, but not a single case of enteric fever or diphtheria had occurred, though there had been cases of the kind in the immediate neighbourhood. If asphalt was too costly, dry sand, free from clay, and common coal-tar, would be found almost equally effective.

Several Scottish Painters have works in the Salon, including Messrs. Black, Downie, Henderson, Kay, Middleton, Newbery, Adamson, Affleck, Bruce, Edinburgh; Michie, Allan, Meldrum.

A Greek Coin in silver—Delphoi, Phocis; (Amphiktyonic Council, B.C. 346): AR weight 189.5 grs.—was sold at Messrs. Sothebys on Tuesday for 239*l*. It bore a bust of Demeter and a figure of Apollo.

The National Society of French Architects have arranged that the subject of the competition this year will be "A Daily Newspaper Office." All French architects between eighteen and twenty-six years of age are eligible to compete.

The Italian Government have ordered a competition among the medallists of the country for the new gold, silver and bronze coinage. The prizes range from 1,000 to 4,000 lire.

Alexander Tondeur, the German sculptor, died on the 22nd ult., in his seventy-sixth year. One of his works is the colossal statue of Wilhelm I. in Dessau.

The Manchester Society of Architects have elected the following Council:—President, J. H. Woodhouse; vice-presidents, C. H. Heathcote and J. W. Beaumont; hon. secretary and treasurer, Paul Ogden, assistant hon. secretary, George Brown; members of Council—Fellows: John Ely, J. B. Gass, E. Hewitt, Jesse Horsfall, A. H. Mills, J. D. Mould, Isaac Taylor, G. H. Willoughby, P. S. Worthington; Associates: Godfrey Colles, J. H. Gibbons, A. E. Corbett.

The Glasgow Corporation sub-committee on art galleries have selected from the Glasgow Fine-Art Institute Exhibition three pictures to be purchased by the Corporation, viz., "Breadwinners" (300*l*.) by Robert McGregor; "Glen Falloch" (60*l*.) by Wm. Young; and "Orpheus" (125*l*.) by the late W. Fulton Brown.

Adolf von Menzel's oil-painting, "The Market Place in Verona," has been purchased for the Royal Gallery in Dresden.

Mr. William Henry Alexander, of the Manor House, Shipton, Hants, the donor of the building of the National Portrait Gallery, died last week at Weymouth in his seventy-third year. His outlay was 80,000*l*.

Professor Hull, the geologist, will preside at a meeting in the town hall, Kensington, on the 11th inst., which is to be held in order to protest against the demolition of the building now used as a public library, and which was formerly the vestry hall.

A Bridge is to be constructed across the St. Lawrence at Montreal at a cost of 7,000,000 dols. The Canadian Government have given the contract to an American company.

Hexham Abbey is to be restored. A resolution passed at the Easter Vestry requesting the committee to undertake the rebuilding of the nave without delay.

Mr. Henry Price has presented to Wrexham, of which he is a native, a replica of the statue of the late Queen Victoria, which he executed for the Military Academy, Woolwich.

The Halifax Council propose to lay a line of six miles long and 18 inches in diameter, from a reservoir at Brighouse at an estimated cost of 22,000*l*.

Mr. J. H. Martindale, architect, Carlisle, has been appointed cathedral surveyor at Carlisle, in succession to the late Mr. Ormiston. The appointment of diocesan surveyor also held by Mr. Ormiston, is in the hands of the deans, who have not yet filled the vacancy.

A Meeting of Welshmen has been held in Liverpool at which it was resolved to make efforts to secure the donation of the Welsh National Museum for Wales with the walls of the ancient castle of Carnarvon, being strong opinion that such a location would most fully meet the objects sought to be served by such an institution, and would also be in full accord with the national sentiment.

Mr. Walter Aston, of Macclesfield, architect, who died on January 29, aged forty-four, left estate of the gross value of 5,429*l*. 16*s*. 4*d*.

The Education Committee at Rochester have decided to admit to the public elementary schools for the future children under five years of age, owing to the enormous cost of building schools.

The Liverpool Water Committee have decided unanimously to recommend the City Council not to appeal against the decision of the High Court in reference to the sum to be paid by the Corporation for the Rivington estate, owned by Mr. W. H. Lever.

The Archaeological Congress which was held this year in Athens will assemble in 1907 at Cairo. The Egyptian Government have approved of the arrangements.

A Nelson Centenary Exhibition is open at the United Service Institution. Any profit arising will be devoted to the promotion of the naval and military arts and sciences and for the enlargement and improvement of the museum.

The Royal Society of Painters in Water-Colours have elected Mr. Alfred Parsons, A.R.A., and Mr. W. J. W. Wright as members.

Mr. William Watt, a Scotsman, has been appointed director of science and art in the Düsseldorf Institution.

Mr. C. J. Holmes, Slade Professor, delivered on Wednesday the first of a series of lectures on "Colour" at his residence in University Galleries, Oxford.

The Chantrey Trustees have purchased the water-colour drawing of "A Python and a Peacock" by Mr. E. Alexander. Mr. Bundy's "Morning of Sedgemoor," Mr. Cadell's "St. Agnes," Mr. Compton's "Autumn in North," Mr. Aumonier's "Black Mountains," and Mr. Speed's "Toledo."

Mr. T. P. Worthington, architect and civil engineer, at Fleetwood on Tuesday. The pier and several buildings in Blackpool were designed by him.

The Oswestry Rural District Council have instructed Messrs. R. E. W. Berrington & Son, civil engineers, Wolverhampton and Westminster, to prepare plans and estimates for the water supply of the districts of Gobowen, Whittington and Hengoed. They are also instructed to prepare a separate scheme for the water supply of the village of Selattyn.

The Claims for property required by the improvement and finance committee of the City of London during the past year amounted to 31,977*l*. The claims were settled for 23,282*l*.

Dr. P. W. G. Nunn, medical officer of health for Bournemouth, in his annual report suggests that greater attention should be paid to the planting of pine trees in the town to make up for those destroyed where buildings are erected. He recognises that the Town Council has entirely failed to recognise the importance of the planting of pine trees.

The Architect.

THE WEEK.

THE Court of Appeal have adopted a decision by a county court judge which, although right in law, appears to be hard on a sufferer. A bricklayer in Birmingham while going to the builder's office for his wages was told by the foreman to assist some men who were moving an iron girder. He injured his hand, and in consequence was obliged to ask for compensation. He was told he could receive 15s. 11d. per week, or one-half of his usual earnings. The money was paid for about three months, and then it was said he was able to resume his ordinary work. Afterwards he was obliged to enter a hospital, where two of his fingers were amputated. At his request the secretary of the union applied by letter for compensation for the man. The county court judge held that the demands for compensation were not good, and, what was more important, that there was no case, as the accident did not arise out of and in the course of the man's employment, for he was a bricklayer, which did not comprise moving girders. The Master of the Rolls said:—The question was one of fact, and the finding was in accordance with the evidence given by the injured workman himself, who stated that it was no part of his duty to move girders. Therefore the finding that the accident did not arise out of the man's employment must be affirmed, and the appeal failed. This is one of the cases which compel workmen to believe that the Act was not drawn up in their interest. A foreman omnipotent in a builder's yard, and there is generally a desire to make everything tidy before the premises are used on a Saturday. A man who under such circumstances would decline to help in moving a girder could expect that his services would be long retained.

REFRIGERATION has now become an important industry, and was the subject of an address by Sir CHARLES PETRIE, the president of the Cold Storage and Ice Association, on Monday. He advocated the selection of sites for the stores which would be near the anchorage vessels, in order that the goods could be hoisted into rooms and the expense of handling and cartage would be diminished. As to the kind of buildings which are best adapted for the business, there is a difference of opinion among experts. Some believe they should be underground, but Sir CHARLES PETRIE considered underground stores could not be free from the disadvantages of damp, foul air, &c. The by-laws condemned the use of brick walls and a slate roof, but it was of no consequence in a practical sense if other materials were adopted so long as insulation was secured. He said that charcoal, carefully and firmly packed, was one of the best of the insulating materials; next was waste cotton. In America pumice stone was now largely used with good results. In New Zealand, as there are large supplies, pumice is preferred. Charcoal and silicate are sometimes combined, or charcoal and ice. The Germans use bricks made of granulated ice and some binding material. Ammonia compression is now the almost universal system of generating cold, but whether cold air should be circulated by what is known as the "direct expansion system" in brine tanks, or the "fan and trunk system," known as the "refrigerator system," is a disputable question.

WE suppose contractors are dubious about the action of the Brighton Corporation, for otherwise the action brought against that body by Messrs. PEDRETTE & Co. would be difficult to understand. Having entered a contract for the construction of the foundation and other work at the generating station it was necessary to give security. For that purpose 6,000*l.* were lodged with a bank and the necessary guarantee was obtained. The work was completed in

November 1902, but no release was given by the Corporation. Accordingly the deposit yielded only 1½ per cent., and it was claimed that 5 per cent. could be obtained. Messrs. PEDRETTE brought their action for the release of the bond and for damages arising out of the loss of interest. Apparently the Corporation were ignorant of the arrangements between the contractors and their bankers until an application was made in November 1903 for release, but it was easy for them to plead that they were still entitled to hold the bond as security against any latent defects that might appear in the works. Mr. Justice BUCKLEY considered the Corporation were, by the contract deed, entitled to keep the bond as security for latent defects, and therefore dismissed the action with costs. It is possible the contractors were unreasonable in their way of seeking the release of their money, but is it fair to keep so large a sum for an indefinite period in the expectation that some "latent" defect will arise? Unless the Brighton Corporation change their system of dealing they must expect that contractors in their tenders will assume that latent defects may also arise in measuring work or in interpretation of deeds.

Is it prejudice which prevents Scottish builders from using English bond? Whatever may be the cause, it will be dangerous to adopt any other arrangement, if the permission is given on the understanding that English bond is to be adopted. A case relating to the subject has come under the notice of the Arbroath Dean of Guild Court. The erection of a brick wall 9 inches thick was sanctioned on the condition that it should be built in English bond, and that there should be a header and stretcher course turn about. The burgh surveyor found that the wall had been built, but not in accordance with that condition, the wall having three courses stretcher to one course header. The builder assumed the responsibility for the departure. His explanation was that it was impossible to build in English bond without going beyond the bond, and he had built the wall in English garden wall bond. The surveyor said it was the first time he had heard of the impossibility of adopting English bond. One of the bailies said it was time that builders should learn they were not to disobey the orders of the Court. After some discussion it was decided to treat the case as a first offence and overlook the contravention; but in future the provisions of a new Act will be enforced, by which, in addition to a penalty of 50*l.*, the building or other work can be ordered to be taken down.

DURING some time negotiations have been in progress respecting the preservation of the abbey buildings in Arbroath. The Town Council on one side were eager to retain their authority, while all expenses would be borne by the Treasury. At length the matter has been arranged. At the meeting of the Council there was submitted for consideration a minute of agreement between the Council and the Commissioners of H.M. Office of Works. It proposed that the Commissioners should be the guardians of the buildings under the provisions of the Ancient Monuments Protection Acts, 1882 and 1900, the Commissioners undertaking the preservation and maintenance of the buildings, and the Town Council remaining liable for the upkeep and repair of the roadway and pavements leading through the Abbey Pond, and for the maintenance of the Abbey House, which is to be retained by the town, except the portion known as the Abbot's Kitchen. The agreement was approved. The burgh surveyor is to make a sketch of the part of the Abbot's House which is to be handed over to the Office of Works. It was stated that there was a portion of the basement of the Abbot's House believed to be built up, and as the Council thought it might be desirable that some investigation should be made into the accuracy of this statement, it was agreed that Mr. OLDRIEVE, of the Board of Works, should be communicated with on the subject.

ARCHITECTURE AT THE ROYAL ACADEMY. II.

PEOPLE are becoming alarmed about municipal expenditure, but in the majority of cases substantial value was received, and, what is more, still exists. If they would remember that the money required cannot be obtained without a public investigation before a representative of the Local Government Board, at which objections can be raised, they would realise that there is always sufficient deliberation before municipal works are commenced. If the expenditure seems large it is owing to the neglect of former years and the resolution of the present generation to no longer endure discomforts which were accepted by their predecessors. Hence it is that so many designs for municipal offices are to be seen in the Architectural Room, all of which owe their existence to the shortcomings of the existing buildings.

The "Public Offices, Assembly Hall and Library, Ilkley," by Mr. W. BAKEWELL, will be a desirable addition to a town which many strangers visit. We do not always approve of the principle of combining accommodation of different sorts under one roof, for generally land has to be sacrificed, and the loss exceeds any gain which may be obtained. In this case the buildings appear to cover a large area, and we suppose local requirements made it necessary to combine the assembly hall with the public offices. The buildings are well balanced, and people will soon become acquainted with the different departments. The "Design for Free Library, Whitehaven," by Messrs. ASHLEY & NEWMAN, is a square block well adapted for its use. The "Public Library, Glasgow," by Mr. T. GIBBON, is remarkable for the entrance, which would be suited to a larger building. "The Town Hall and Law Courts, Hull," at once impresses the spectator by its extent. That may have been the intention of Messrs. RUSSELL & COOPER, for they have avoided variety, or any other quality that would diminish the effect of the Classic pile. "The City of Manchester new Fire and Police Station," by Messrs. WOODHOUSE, WILLOUGHBY & LANGHAM, suggests the importance of the service to which it is devoted. There are many storeys with a great number of rooms and there is a tower which dominates the high building. Messrs. SHEPPARD & BURKINSHAW have a design for the "New Public Baths and Extension of Town Hall, Chelsea," forming a very large group, and with the requisite tower. Another design for the same work is by Mr. LEONARD STOKES. This is a case in which the two services might have been separated. In his design for the "Library, Town Hall and other Public Buildings, Eltham," Mr. MAURICE ADAMS endeavours to evade the difficulty by avoiding uniformity, and his treatment is therefore more logical. In the "Municipal Buildings, South Shields," by Mr. ERNEST E. FETCH, the tower seems to be an unnecessary feature. Economists could raise no objection to Mr. A. E. DIXON's "Design for Pontypridd Town Hall," for it is probably the simplest building of its class in the room. "The Grand Staircase, Municipal Buildings, Walsall," by Mr. GIBSON, is one of the best examples of treatment of the Renaissance in the exhibition. It certainly is grandiose, and well adapted for use on ceremonial occasions. The treatment of the angles by brackets is successful. The "Proposed Memorial Laboratory in a Country Town," by Messrs. SILCOCK & REAY, has nothing which suggests its purpose except a figure in a niche, and it might well be used for a residence. The "Design for Picture and Sculpture Gallery," by Mr. J. B. FULTON, suggests the latter purpose by figures in niches, for no paintings are visible. It is a good Classic example. The "Barry Municipal Buildings," by Messrs. HUTCHINSON & PAYNE, is Classic, but symmetry has not been respected. The "Public Library, Harrogate," by Mr. H. T. HARE, shows the entrance, and suggests a treatment of ashlar which will give dignity to the building. Mr. A. R. MAYSTON shows "The Interior of the

Assembly Room in the Town Hall, Sutton Coldfield. There is a curved roof to aid acoustics, but such roofs are only to be seen at night, when the plainness of walls would not be observed or would be disregarded. Whatever may be the utility of the colonies they have not brought much gain to architects in England. The competitions lately announced in South Africa have passed to local practitioners. Mr. T. E. MARRAS's design for "Town Hall, Public Buildings and Municipal Offices, Durban," forms an admirable group, but it would, however, have been improved if the dome were raised or enlarged. Another design for the building is by Messrs. MITCHELL, RAINE & PAYNE. In this case instead of a dome there is a tower. Payers who are not on the Council may object to the Council Chamber in the Town Hall, Deptford, by Messrs. LANCHESTER & RICKARDS; it is certainly richly executed, and is comparable to the chambers seen in some of the Belgian halles. The same architect shows another Council chamber—viz. that at Cardiff, which is differently planned, but also costly. The arrangements for lighting increase the effect of the woodwork. The "Central Reference Library, Bristol," by Mr. H. PERCY ADAMS, will be an ornament to the city. Sculpture has been advantageously introduced over the windows. His design for the "Open Chapel at the King's Sanatorium" is novel. The other design for the Bristol building by Mr. M. KNOTT & COLLINS.

Church work has inspired many of the designs. Messrs. MURRAY & SEDDON's "Painted Decorations, Christ Church, Bristol," is pleasing in that part which suggests the ornament of the Loggia of the Vatican, but another part which seems intended to represent a Gothic church is less satisfactory. Mr. W. J. TAPPER has two designs of the "Church of St. Erkenwald, Southend," a severe Gothic building. The "Tower, Church of the Ascension, Balham Hill," by Mr. T. E. LIDIARD, appears in the drawing too prominent for the building. Mr. CHARLES BLOMFIELD's "Rood Screen, St. Mary's Prior Church," is a fine design showing beautiful work as well as a rood. We published Mr. SEDDING's design of a church at Newton Abbot a fortnight ago, and it is one of the successes of the year. The "Church of the Birch," by Mr. EDGAR WOOD could easily be executed in concrete. Mr. PONTING's "Christ Church, Shaw," shows an interior with a reredos and a timber roof, but although the piers may not interfere with the view of the worshippers in the aisles, they are too slight for architectural effect. CATTERALL's "New Chapel, &c., at the Ormerod Works," is well grouped, but it is hung too high for the exhibition it deserves. Mr. F. K. OLIPHANT's "Rood Chancel Screen, St. Mary's Church, Houghton," has been already illustrated in *The Architect*, and the drawing has the advantage of colour, and is the more expressive. The design for "St. Martin's Church, Cicester," by Mr. G. H. FELLOWES PRYNNE, shows a proportioned Gothic building with grey wall and a roof. "St. Chad, Longsdon," by Mr. GERALD HARRISON, is another satisfactory church; the tower, with its short steeple, is well adapted for a country church. The interior of "St. Wilfrid's, Harrogate," by Mr. J. MOORE, shows a fine groined roof; the piers are not too massive, and the chancel is dignified. NICHOLSON & CORLETTE's design for the "Lichfield Cathedral" was deservedly admired. The proportions are massive, and would form a landmark seen from the Mersey; but evidently it was intended that the windows and other details should show Gothic delicacy. The design asserts itself amid the drawings near it. The design for a domed church by Mr. LIONEL W. GRACE, shows a massive structure suggestive of the endurance of the faith, and would be well if some ecclesiastical body were to build it. The "Memorial Baptistery in Buckley Church," by Messrs. DOUGLAS & MINSHULL, is perfect in its details, and has the advantage of decoration in

The educational buildings are important. Mr. F. M. JENKINSON in his design for "University College School, Hampstead," has a curved plan for part of the frontage; brick is used and sculpture is introduced into the details. Mr. ARNOLD MITCHELL in his design arranges a school in three blocks instead of one, with a result that is very successful. The "Grammar School, Lincoln," by Mr. LEONARD STOKES, is an attractive building with large windows and an appearance of being dated with former times by the simplicity of the arrangement. "St. Michael's Theological College, Llandaff," by Mr. F. R. KEMPSON, shows a chapel and residences fully combined. The "Proposed Grammar School, Lincoln," by Mr. C. F. A. VOYSEY, would be likely to command the suffrages of schoolboys, for the white buildings around the large lawn appear more suggestive of a holiday resort than a place of restraint and occasional punishment. In the "Medical School, University College Hospital," the Italian style has been adopted by Mr. P. WATERHOUSE, but economy is to be respected. The "Liverpool Cotton Exchange," by Messrs. MATEAR & SIMON, will be a worthy addition to the architecture of that city. It is Italian, and carried out in a manner that is almost perfect. In the projecting colonnade the Tuscan order has been used, and in the main building Ionic. Sculpture has been introduced in positions where it becomes telling. "New Shipping Offices" in Cockspur Street, by Mr. J. TANNER, jun., received attention from all passers-by while it was being erected. Among the noticeable features are the large columns which appear to support the building. The building indicates the transformation which is now in progress, for a few years ago the Cockspur Street buildings were characterised by absence of ornament. "The Royal London Friendly Society's new buildings, Southampton Row," by Messrs. BRADSHAW & ASSHALL, is a massive building, we might almost say a palace, and would serve as a symbol for security. There is a difference in treatment between the façades, which denotes enterprise to erect such a building. In "Wesleyan Church Buildings, Bolton," the architects have adopted Gothic as the style. Their new "Stock Exchange, Manchester," is adapted for an excellent model for a bank, for burglars would find the ground floor rather difficult to enter.

As usual, the majority of the drawings are representations of houses. While a certain style prevails, whether it is in fashion, it is difficult to attain novelty. HALSEY RICARDO has the courage to use green glazes with cream dressings and green pilasters in "House, Addison Road." The arrangement is original in the design. In "Proposed Shops in a Provincial Town," Mr. MIDDLETON SHALLCROSS recognises that the building will be subtle, and provides several sign-boards, a more sensible arrangement than planning a building for one occupier, with the result that architectural features have to be justified by announcements. The "Gate Lodge, Holly House, Skibbereen," by Mr. R. S. BALFOUR, will be a novelty in Munster on account of its tiled roof supporting columns. There is also original treatment in his "House overlooking Poole Harbour, Dorset." Mr. S. K. GREENSLADE, having to deal with a narrow site, has arranged his "House at Caversham, Oxford," around it, forming a picturesque group that is bound to be often imitated. Mr. E. GUY DAWBER has a rare opportunity in dealing with the site of the "Cottages, Sandon," for they seem to adjoin a large green. "Solom's Court, Surrey," by him, is a small and picturesque house. Another large country house is Mr. G. C. HORSLEY's "Framewood," the details being made prominent features. "Whitehall Mansions, Charing Cross," is in the Germanesque style, and Messrs. TREADWELL & MARTIN have made a mistake. "Maesycrugian Manor," by Mr. A. MITCHELL, features a long, low terrace. One of the most important mansions is Messrs. DOUGLAS & MINSHULL's "Llandshaw Hall," in which they have departed from

the half-timbered system. Mr. ERNEST NEWTON has three characteristic country houses. The "Villa near Brussels," by Mr. R. FRANK ATKINSON, makes no concession to local peculiarities, but is as English as if it were to be erected in Surrey.

SCHILLER AND ART.

IN 1859 the Germans celebrated the centenary of the birth of FRIEDERICH SCHILLER. The people at that time did not differ much from those who were the contemporaries of the poet. Germany was still a geographical expression rather than a country, for the small kingdoms, principalities and dukedoms corresponded with those with which he was acquainted. SCHILLER was essentially the poet of aspiration. He believed the Golden Age was yet to come, and the desires which he expressed in the eighteenth century were similar to those of the people in 1859. It was impossible then to realise that in about a dozen years the longed-for unity would be attained, and, like the majority of things in this world would bring disappointment with it. The people of 1905 are more sober than those of 1859, and there seems a special fitness in their commemorating the death of FRIEDERICH SCHILLER. They are to be excused if, while they think on him with regret, they are dissatisfied for having been led astray by his poetry. The Golden Age has not yet come to Germany, and unless people are deceived by contemporary signs there are many sorrows awaiting the Fatherland. SCHILLER, as their idealist, must therefore suffer in popular esteem, and the celebrations this week were in many cases inspired by a sense of duty rather than by impulse. The poet derived from KANT the belief in the necessity of the play-impulse in whatever relates to art in its widest sense. But judging by the descriptions we have received from Germany the "Schillerfeier" has not been marked by many indications of delight. It might be supposed that the people had discovered that the feet of the idol were of clay.

It is not advantageous that so remarkable a revolution in German thought should arise. As Madame DE STAËL declared after meeting with the poet, "SCHILLER n'avait dans son âme que de généreuses pensées." She seems to have been more struck with his morality than with his genius. His conscience, she says, was his muse, and his writings corresponded with his soul. It is beautiful, she continues, when we find innocence united with genius and candour with force. He was the best friend, the best husband, the best father she had met, and she was struck by his enthusiasm for art. Virtue is unconquerable, and it must be hoped that the power by which SCHILLER was inspired was no *ignis fatuus* which was intended to lead men astray. His poetry and other writings have not ceased to exercise an influence on the younger generation of Germans. If afterwards they become indifferent to them the cause is to be found in the circumstances of our time, which are unfavourable towards aspirations after an ideal.

It is not our task to determine what are the qualities in SCHILLER's writings which disqualify them from serving the purposes which the author contemplated. We propose to restrict ourselves to a brief consideration of the effects which were produced by that enthusiasm for the fine arts which impressed Madame DE STAËL. In this case especially it is impossible to escape one of those comparisons with GOETHE which it has been the fate of SCHILLER to be always sustaining. Everyone has heard of the first occasion when GOETHE entered SCHILLER's house. The elder poet had not approved of the class of writing which was represented by SCHILLER's "Robbers," and in consequence he had a prejudice against the author as a man who was dangerous to society. But after a lecture they walked out together. GOETHE, who at the time was full of natural history, began explaining his views on the subject and went into SCHILLER's room to

continue the conversation. GOETHE was an evolutionist long before DARWIN, and he showed how by simple metamorphoses a plant could assume remarkable forms. SCHILLER's reply was, "That is an idea not an experience." At that time among the followers of KANT the word "idea" had a special significance. But GOETHE was not a follower of KANT. The truth was SCHILLER believed that whatever was beautiful must come from inspiration, while GOETHE thought that experience was the source of all knowledge.

GOETHE was a proficient in some branches of art. He could draw and paint, was a collector, and he even superintended the erection of a public building in order that his knowledge of architecture might gain precision. He investigated the history as well as the principles of art. We have articles by him on building, sculpture, ornament, and his very numerous reviews of books on art display almost encyclopædic knowledge. He translated the biography of BENVENUTO CELLINI in order to prepare himself for his travels in Italy, and one of his first acts on arriving in the south was to go in quest of a copy of PALLADIO's works, which he considered to be indispensable, as architecture was the basis of Renaissance art.

With SCHILLER we see no signs of similar self-education in art. His ideas were certainly exalted, but they were never subjected to the practical tests to which GOETHE submitted himself. The poem of "The Artists" is undoubtedly very noble; indeed, GOETHE could not have composed it, and in several of his writings we find ideas about the supremacy of art which probably the world will never be able to realise. In fact, the faith of SCHILLER in all that art can accomplish as a political agent must have amazed the statesmen of his country. Born in 1759, he was in his thirtieth year when the French Revolution broke out. He had suffered at the hands of the Duke of WÜRTTEMBERG, and he was liable to imprisonment for life because he ran away to Mannheim, in order to have one of his plays acted. He was therefore ready to sympathise with those who wished to create a new Europe in which tyrannical kings and grand dukes would cease to exercise their despotism. It was not long before many terrible excesses were exhibited in France, and SCHILLER sought by means of his writings to persuade Frenchmen about the advantages of moderation, or, in other words, to let themselves be guided by æsthetics. It was as vain a proposal as trying to extinguish a conflagration with eau de Cologne, but some of the French revolutionaries realised the goodwill of the writer, and out of gratitude SCHILLER was included among the men to whom France and Liberty were indebted.

SCHILLER acknowledged that he was mainly following out the principles of KANT, a statement which would have overcome the equanimity of the Königsberg philosopher if it came to his knowledge. The first conclusion is no less surprising, for SCHILLER maintains that as beauty leads to freedom, therefore all hereditary bondsmen must go through an æsthetic course. The statesmen, he said, corresponded with the artist who elaborates a shapeless mass to his own design. There was, however, a difference, for instead of sacrificing the material he must preserve its distinctive and personal nature. The Greeks were proposed as models, because in their public life they presented all the attraction of art as well as the dignity of wisdom without any sacrifice of their native character. But to attain a resemblance to such a state of things the age must first recover itself from its debasement and return to simplicity and truth. With SCHILLER art signified everything that was noble, and in reading what he says we are sometimes in doubt whether he is addressing the student of fine art or the patriots who were endeavouring to raise up an oppressed nation. The same principles are applied to politics and to art. It may be because the Germans have at last realised how vast is the difference between a fine painting or

statue and a system of government that they were no longer able to appreciate SCHILLER's like fathers.

SCHILLER could not ignore the melancholy fact in many ages when art was in an advanced state there was little or no liberty. If in the days of PERICLES art was at its highest, the great works seemed to be an indication of the approaching time when Athens would bow to the ruler of Macedon. In republican Rome art had few lovers. The emperors patronised it as an auxiliary. Florence also could associate its art with the government of the MEDICIS. SCHILLER's opinion was, however, not to be subdued by any experience which history recorded. He considered that art could realise the importance of art then they could demand it and uphold it. The French Revolution would appear to have taken the hint, for what was the aim of DAVID and those who assumed Roman manners, and, as they thought, Roman manners and customs? It was an attempt to realise the ideal State imagined by SCHILLER, and which was to be founded on art rather than on selfishness?

It was not extraordinary that SCHILLER should have appeared up as a law-giver, or that he should propose the creation of beauty as the one thing necessary. Although he was brought up in comparative seclusion, his first play, "The Robbers," is a protest against the system of his time. His "Fiesco," his "Don Carlos," his "Wallenstein," his "Maria Stuart," his "Jehovah," his "Arc," his "William Tell," his "Demetrius," all represent States in which things were out of joint, and his historical works, "The Thirty Years War" and "The Revolt of the Netherlands," belong to the same category. Throughout the whole of the works, as GOETHE said, the idea of freedom was paramount, and was carried to excess. Although he was not considered a politician, and, indeed, there was no room for one in the States in which he lived, yet in his solitary moments he must often have bestowed attention on public affairs, and he was therefore glad to be able to give a more impracticable, theory of government. All he said on the subject had the effect in Germany of increasing the number of his enemies.

His incursions into the domain of politics naturally did not affect his poetic powers. Some of his best works were afterwards composed. At the time of his death he seemed competent to undertake work of equal merit. He believed, as we have said, in art, or, in other words, that the poet was born not made, but he spared no labour in his efforts to increase his innate power by the severest study. Hence it was not surprising that GOETHE was so struck by the progress of SCHILLER. When they met after a week's absence he found the young poet had advanced in several ways, and that his progress was not temporary but continued throughout his life.

THE SOCIETY OF ARCHITECTS.

WITH a view of enabling some of the provincial architects to meet together, it is proposed to send visits to Chester and Liverpool on June 2 and 3. The arrangements for the convenience and pleasure of the members are being undertaken by the president, Mr. Thomas, who is desirous of meeting as many members as possible on this occasion. Before, however, going into detail, it will be necessary to know approximately what support the proposal will receive from the members. The itinerary will be roughly as follows:—Friday, June 1: Arrive Chester, lunch together, and afterwards visit the principal buildings, &c.; proceed to Liverpool in the evening. Saturday, June 2: Liverpool, see principal buildings, and leave for London, &c., in the evening. Members are invited to bring ladies, and will be permitted to invite friends to join the party. It is requested that members will inform the secretary not later than May 15 of their intention to join the party, and the probable number of friends they will bring. The final arrangements can only be made if at least a few members signify their intention of taking part.

WHITGIFT'S HOSPITAL, CROYDON.

THE Whitgift Hospital at Croydon was visited on Saturday, April 1, by members of the Upper Norwood Athenæum, under the guidance of Mr. Jonathan Downes, it being the third winter meeting of the Society. A number of the members and their friends assembled in the quadrangle of Archbishop Whitgift's noble foundation, which has been attacked by Philistines from within and without, and has only recently undergone a violent assault from the enemy, which had been frustrated, at all events for the time, by the vigorous defence of men of light and leading, taste and culture. *Gaudeamus igitur*, and we trust that with on æsthetic and utilitarian grounds these unseemly attacks may cease. The party were met at the Hospital by Alfred Jones, B.A., the warden, a gentleman whose ripe scholarship is only surpassed by his zeal for the foundation and the welfare of the poor folk committed to his charge. He entered at length upon the history of the Hospital, its architecture, its ancient bell. He showed the visitors the charters, including Whitgift's Deed of Gift, the antique silver vessel, the mazer bowls of wood and silver, the books of accounts, the woodwork—

Carved with figures strange and sweet
All made out of the carver's brain,

stained-glass windows, the chapel and its oaken seats and the portraits. So much is there to be seen and described that it is customary for Mr. Jones to ask his visitors to stay a fortnight while he tells them all about this wonderful place. He was the guest of the members at tea at the Greyhound, and after Mr. Downes had introduced the subject, Mr. Jones added to the fund of information already imparted, receiving, with the leader of the day, the hearty thanks of all present. Mr. Frank E. Spiers, the chairman, presided, and among the visitors were Messrs. Munro,

Whitgift at once set about to remedy. The historian Mosheim thus sums up Whitgift's character:—"He was disinterested, consistent, single-minded, liberal and discerning above most men. His great natural blemish was hastiness of temper. This, however, he corrected by a spirit so thoroughly considerate and forgiving that his friends rather apprehended from him undue lenity. When principle was at stake he would make no compromise. In secular politics he did not interfere, usually retiring from the council board when it was unoccupied by ecclesiastical affairs." In the latter connection it may be remarked that he was offered the post of Lord Chancellor in 1587, but consistently refused it. He died in 1604.

Such was the prelate whose primacy marked the new type of English bishop; the days when an Anselm and a Becket were compelled to withstand the king were over, and henceforth the duties of the successors of the apostles were confined to the spiritual and such of the temporal as did not partake of a political nature. That those duties were political in a truer sense was emphasised in the case of Whitgift, who, in founding his Hospital at Croydon, pierced the heart of the problem, how to combine the spiritual with the temporal welfare of men. It was no new problem, and it was solved in no new way. For ages past the Church had been the nation's benefactor, and in ages to come she would fulfil the same office. While Whitgift crystallised the method by his foundation of this Hospital, temporarily under a cloud in these artificial times, future ages will revert to it as the most satisfactory solution of the problem of the aged poor.

Whitgift commenced the building of his Hospital in 1596, and intended it for the aged poor and infirm of Croydon and Lambeth, with which he was immediately connected through the archiepiscopal palaces in those places. Stow, writing in 1600, says:—"This year the most

WHITGIFT HOSPITAL.

WHITGIFT HOSPITAL—HETHER GATEWAY.

n, Davis, Clarke and Frost. Mr. Downes read the following paper:—

Notwithstanding the spirit of mere utilitarianism which has sprung up in modern days, there still remain in our country many of the ancient charitable foundations known as hospitals, of which the one under consideration is the most interesting example. Last year our Society selected one of the most important, the Hospital of the Holy Trinity, Winchester; and on former occasions Abbot's Hospital at Guildford, the College at Cobham, Kent, and the St. Mary's Hospital at East Grinstead and several others have been visited. St. Mary's Hospital at Chichester, St. Andrew's Hospital at Sandwich and a similar foundation at Canterbury are also interesting examples of this kind of mediæval institution.

John Whitgift was born in 1530 at Great Grimsby, Lincolnshire, and became Master of Trinity in Cambridge. He was appointed Dean of Lincoln in 1573, and transferred to the Bishopric of Worcester in 1576, advancing to the Archbishopric of Canterbury in 1583, in which high position he succeeded Archbishop Grindal, whose lenient attitude towards the existence of abuses which the stronger

reverend father, John Whitgift, Archbishop of Canterbury, did finish that notable and memorable monument of our time, to wit, his Hospital of the Holy Trinity in Croydon, in the county of Surrey, by him there founded and builded of stone and brick, for the relief and sustentation of certain poor people. As also a fair school-house for the increase of literature, together with a large dwelling for the use of the schoolmaster." The inmates of the Hospital, known as "brethren and sisters," selected the warden from their own body, and he, together with the schoolmaster and the "auncienteste brother, so he be able to goe and walke abroad, or ells the next in auncientye that is able," formed the "clavigers" who each held one key of the three locks of the treasure chest. The building was completed in 1599, and is an interesting example of Elizabethan work, marking the decline of Gothic and leading up to the revival of Classical styles. Throughout it is of red brick with stone facings, except in the case of one of the kitchen windows, where moulded bricks are used. The arms of Whitgift are placed over the entrance, together with the motto of the Hospital, "Qui dat pauperi non indigebit." We enter at the west end of the quadrangle and come upon a beautifully

turfed courtyard; at the opposite or east end is another entrance, which led to the now confiscated gardens and fields of the Hospital, but now terminates in a meagre backyard. Within this gateway a flight of wooden stairs leads to the great or audience chamber; a quaintly worded inscribed intimation is given to "rub well thy shoon before these ancient stairs ye tread." In the north-east angle is the kitchen; next to it the common hall; on the southern side of the gateway, or "hether gate house," are the warden's rooms, and the chapel is in the south-east angle. The movable treasures (long may they remain unmoved) of the Hospital are many and varied in character, but all in harmony with the quaint old-world taste of our forefathers. There is the bell, older than the Hospital itself, and probably dating from 1414, which was placed in position in

WHITGIFT HOSPITAL: AN UNRESTORED WINDOW.

1612, and was outside the building so late as 1795. It came from Lincoln Cathedral. The common hall on the ground floor retains the original chimney-piece and andirons, the oaken table is dated 1614, the stained-glass medallions in the windows are charged with the arms of Whitgift impaling those of the See of Canterbury, the royal crown of Queen Elizabeth, the arms of another archbishop bearing a shamrock leaf impaled with the pallium, the royal standard of Queen Elizabeth, and the arms of Edward Aylworth, 1598, who "was at the charge of the casements and the glazing of the halle, and it cost him 3*l.* 4*s.* 2½*d.*, and he gave at his death *vi. tie ragg gowns.*"

WINDOWS IN STANFORD CHURCH.

AT a recent excursion of the Architectural and Archaeological Society of Northampton and Oakham, Stanford Church was visited, when Mr. C. A. Markham read the following paper:—

The church of St. Nicholas is singularly uniform. The tower is original except the parapet and pinnacles, which are debased in character. In the corners are squinches, which show that the architect originally intended to build a spire. The windows in the chancel are of the plainest Decorated type. The clerestory is also Decorated, though probably a later addition. The striking effect of the interior is due chiefly to the absence of seats throughout the aisles and a great part of the nave, and to the slenderness of the pillars, rising with continuous mouldings into pointed arches, which are surrounded by a hood of roll-moulding.

The organ came from the royal Palace of Whitehall having been sold by Cromwell. In the south aisle there is an excellent piscina and an original sepulchral recessed with much beauty, with its mutilated recumbent figure. There is also a monument for the late Baroness Bray Thornycroft; one for the Hon. R. Otway Cave, by Thomas Maccott; and another by Kessell, for the Hon. Thos. Otway Cave. The communion plate consists of a cup and cover made in 1604 of elegant design, a silver paten of 1637, a large silver gilt alms dish of 1674 given by the Rev. Edgell Wyatt-Edgell, and a silver flagon of 1712, given by Sir Thomas and Dame Mary Cave.

But the glory of Stanford Church is its stained glass, which a large amount still remains of the Decorated, perpendicular and Cinque Cento styles. The earliest piece of glass is certainly that in the east window of the chancel, which appears to have been made about 1340. In the head of the most tracery light is a Royal head—similar to the head on the coins of the first two Edwards. The tracery lights of the next row each contained a figure, but all are lost. The next row of three lights contain three figures, the central being a representation of the Divine Christ seated with a mound or globe at His feet; and on either side the figure of a bishop in mass vestments. The lowest row, being the lowest of the tracery lights, consists of five openings, each containing a shield of arms. The first is charged with the Royal arms of England—gules, three lions passant guardant, in pale, or with a label of five points, azure. These arms were borne by Edward II. whilst he was King of Wales. The second shield has the Royal arms of France—azure, semée of fleur-de-lis, or, being probably those of Queen Isabella, the consort of Edward II. On the third shield are again the Royal arms of England, without the label, being the arms of Edward II. On the fourth shield are the same arms, but differenced with a label of three points, being those of Thomas of Brotherton, Earl of Northampton, elder half-brother of the king. Much of the lower part of the window has been closed by masonry, and the tracery which remains is of a later date, some being of the fourteenth period taken from other windows. In the head of the first light from the north is a shield displaying a red cross on a white field, the arms of Lord Wake—or, two bars gules, in chief three torteaux—who was doubly connected with the family. In the head of the next light is a shield with the arms of Warren, probably for John Plantagenet, Earl of Surrey—checky, or and azure. In the centre is a representation of the Blessed Virgin with the infant Christ on her lap. The next light is the shield of Humphrey, Earl of Hereford and Essex—azure, a bend argent, between two cottises six lions rampant or. The last light contains fragments of a shield which may be that of Gilbert de Clare, Earl of Hereford and Gloucester. The original arrangement of the glass in the lower lights of this window cannot be determined.

The next glass in order of date is in the second window of the chancel now remaining open, which is supposed to be somewhat later than 1340. The second window on the west, on the north side, has the heads of two figures in the lower lights filled with the spires of canopies of a bold and lofty character. The canopies themselves have gone, but the figure of a bishop in the east window of the north aisle appears to have come from this window. The remainder of the design of this window cannot be traced. The heads of the lower lights of both the north and south windows are filled with portions of glass from other windows intermixed. Each portion consists of a narrow border and groundwork of white glass ornamented with blue and red. In this glass there are two canopies in the second window on the west, on the north side of the chancel, which appear to have been taken from other parts of the church. The figure under one canopy is St. Margaret; the other figure is unknown. Both canopies are designed to carry high and are dissimilar to the flat-topped canopies which belonged to the other chancel windows. The rest of the stained glass is contained in the windows of the aisles, and varies in date from about 1340 to 1370. The glass, however, in the church is so much alike that it was probably executed under the same superintendence and perhaps by the same artist. The east window of the south aisle contains the latest and most pleasing specimen of Decorated glass in the church. The colouring and tracery of the head of the window is excellently adapted. In the larger lights are represented a figure carrying a cross in its hands, two angels swinging censers, the Crucifixion, and a figure carrying a cross.

Blessed Virgin and St. John the Evangelist. The figures are rendered conspicuous by being coloured lighter on the grounds on which they are placed. The heads of the lower lights have grotesque and royal heads. The stained heads are those of middle-aged females and of old and youthful males; and from the character of the drawing and execution show the date of the glass. The window of the north aisle is very like that in the south aisle. In the upper tracery lights is represented Christ the Judge of the world surrounded by angels, some of whom bear instruments of the Passion, while others summon with their trumpets the dead who are rising from their graves. Below is the Crucifixion, with the attendant figures of the Virgin Mary and St. John the Evangelist. The lower lights are the spires of four canopies. The two canopies below are not in their original positions. The one on the left is the figure of a bishop, and under the other St. Peter teaching the Virgin to read. Two other windows are worthy of note—the first window from the east in the north aisle and the second window from the east in the south aisle. In the principal light of the window on the north is St. Michael in armour, which was perhaps copied from some earlier form. In the two lower principal tracery lights are figures of angels swinging censers, and in the smaller lights birds and fishes. In the north aisle below the rich colouring is confined to the principal tracery lights, in which are represented an Agnus Dei, the figure of St. John and another mutilated emblem. The smaller tracery lights are filled with diaper patterns. The tracery of Perpendicular and Cinque Cento glass are all in quantity and are scattered over many of the windows. In the east window is a fine Cinque Cento group of kneeling figures, members of the Cave family. This window may be distinguished from the earlier glass by its greater clearness and brilliancy and its more highly finished execution. Many of the specimens of heraldry in the windows are of the sixteenth century. Altogether the stained glass in this church possesses great interest and ranks amongst the finest in the country.

CHURCH BUILDING SOCIETY.

THE annual meeting of the Incorporated Church Building Society was held on the 4th inst. at the Church of St. Albans, the Bishop of St. Albans presiding. The annual report stated that the income of the Society for 1904 was £74,000, against £59,187 in 1903. This increase was almost entirely due to the sum received from legacies. The donations increased from 614% to 640%, but the annual subscriptions fell from 592% to 571%. There had been a steady decrease for some years in the receipts from "parochial and other collections," but in 1904 there was a decrease. The number of parishes contributing had not diminished, in many cases the amount sent had been considerably increased. The past history of the Society showed that it had been instrumental in aiding in the erection of no less than 1,379 additional new churches, and in assisting in rebuilding, enlarging or otherwise improving the accommodation of 3,799 other churches or consecrated chapels-of-ease. By means more than two million additional seats have been provided, by far the greater part of which are for the free use of the parishioners according to law. The actual amount of money entrusted to the Society and used in giving grants towards the objects named has reached £861,000.

The Chairman said it was a Society which had deserved the support of the Church public, and he did not think that the Church public quite realised the debt under which it lay to the Society. In the first place, he would like to point out the extreme value of the opinions which they were able to obtain from the consulting architects of the Society on the various plans which were from time to time submitted to them for criticism. There was no organisation in England which had command of such architectural talent as that which was at the disposal of the Incorporated Church Building Society, and it must be a matter of great satisfaction to any one connected with or interested in church building that the plans submitted to the Society were investigated and examined by thoroughly competent and able men, and that the reports given upon those plans were of such a character as to be most helpful to all the people concerned in the building of churches. It was not merely in reference to the plans, but in reference to the moral support given, that the Society was so very helpful.

Mr. C. Hodgson Fowler, in moving the adoption of the report, explained the duties of the committee of architects

and laid stress on the amount of good work which they had accomplished, not only in regard to the erection of new churches, but also, what was perhaps not so well known, in reference to the preservation and renovation of old churches. He also alluded to the necessity of proper and adequate insurance of all church buildings, pointing out the desirability of insuring separately, so far as possible, the different portions of the structures, so as to be able to make a proper claim in the unfortunate event of a fire. He spoke highly of the Ecclesiastical Fire Insurance Society, whose officials, he said, were naturally more fully acquainted with churches and their cost than were those of some of the ordinary insurance societies, and who, as the audience no doubt knew, contributed largely to the funds of that Society, as well as to the various diocesan funds.

Mr. W. S. de Winton moved:—"That having regard to the success which has attended the work of this Society in the past, it is desirable that a vigorous effort be made to secure increased support both for its general fund and its special mission buildings fund, so as to enable it to meet the very pressing claims which are continually being brought before it, and which arise not only from the need of supplying adequate church accommodation for the rapidly growing population in large towns, but also from the gradual decay into which the more ancient and interesting churches of the country are continually falling."

The Chairman said in reference to Mr. de Winton's observation as to the expediency of putting up mission buildings which would last, rather than mere temporary iron ones, with this he fully agreed, and in fact it had been his own practice; when at St. Mary's, Portsea, he had put up one iron church and four of brickwork.

ENGRAVINGS OF DUBLIN.

A PAPER was read before the Royal Society of Antiquaries of Ireland by Dr. E. MacDowell Cosgrave entitled "A Contribution towards a Catalogue of Engravings of Dublin." He said that in attempting to draw up a list of engravings of Dublin two classes of difficulties presented themselves—those of form and those of substance. The form which at first thought seemed best was of course the chronological, yet that magnified the importance of some, and where copies of older drawings had been subsequently produced it caused confusion. It also rendered undated pictures, of which there were many, a difficulty. The other obvious plan was to describe the most important groups of pictures, and then to fit into their proper places those of less importance. The chief difficulty of substance was how far, if at all, book illustrations should be admitted to such a list, as often they were only copies of earlier views; yet if book illustrations were omitted a great deal of information would be lost, as some were original, and sometimes it was impossible to find copies of the engravings which inspired the book illustrator. He had tried to steer a middle course, keeping chiefly to chronological order, but emphasising what was most important, and selecting any book illustrations which threw light on the appearance of their city. Dr. Cosgrave then presented a fine series of pictures, of which the first was one of 1581, representing Sir Henry Sidney leaving Dublin Castle, followed by another illustrating his return; various pictures and maps of Dublin showing the changes brought about in the course of time in the principal public and other buildings, and in College Green, Sackville Street, Mountjoy Square, &c. The pictures, which were frequently copied by contemporary and later magazines and journals, were of great interest owing to the alterations which had since taken place. They were brought down to 1784, and Dr. Cosgrave said he hoped on a future occasion to bring the catalogue.

The Council of the University of Birmingham wish to elect a professor of civil engineering to co-operate with the professors of mechanical and electrical engineering. He will have charge, with an assistant, of the teaching of surveying, strength of materials, hydraulics and other branches of civil engineering, and will superintend the laboratories for hydraulics and strength of materials. The stipend will be 600% a year. The Professor will be allowed to take higher consultative work, to keep in touch with civil engineering practice, provided that it does not interfere with his University duties. Applications, accompanied by 75 copies of testimonials, should be received by the secretary not later than May 20.

NOTES AND COMMENTS.

A CASE which was heard before the stipendiary at Burslem should be interesting to builders of chapels in towns. The trustees of a Methodist New Connexion chapel obtained a site for a new building, and sought exemption on the ground that the land was a place appropriated to religious worship. The magistrate reserved his decision. He came to the conclusion that under the Private Streets Works Act the place to be exempted need not be a building; it was also exempt from the payment of poor rates, because there was no beneficial occupation of the land. He was not, however, satisfied that it could be considered as a place set apart for religious worship solely. He found from an examination of the deeds that the trustees had the power to build a house or houses for a minister or an attendant. If that right were exercised they would not be exempt. If Sunday schools only were erected the question of exemption might give rise to discussion, but in the case of a house there could be no doubt. The magistrate therefore held that the trustees were liable for the cost of the street improvement. The decision is to receive the attention of the National Free Church Council.

In the section of architecture at the Ecole des Beaux-Arts Americans are more numerous than any of the other strangers who attend. It is believed that the average of late years has been from seventy to eighty. American amateurs are not forgetful of the hospitality shown to their countrymen. As a recognition of it Mr. STILLMAN has offered a sum of half a million of francs to the school. The money is to be applied as the Académie des Beaux-Arts may arrange for rewarding French students. Having so much interest in Paris it is right Americans should desire to know more about the city and its masterpieces than they can obtain from their hurried glances whenever they visit it. Recently M. DESPRADALLE, the architect, delivered in Boston a course of lectures to crowded audiences on the "Evolution of Modern Paris." The works he placed as foremost were Notre-Dame, the dome of the Invalides, the Garde Meuble and the Opera House.

THE parish church of Ramsgate is familiar to the majority of Londoners. It is supposed to be Gothic, but when it was erected there were no precise ideas about the style. As the building stands on comparatively high ground the octagonal lantern tower or belfry is a landmark for mariners. The church has suffered through its elevation, and lately the pinnacles and other adornments of the lantern have had to be removed. The restoration of the building is estimated to cost 4,800*l.* The lantern will require 2,700*l.* of that sum. Mr. CARÖE has charge of the work, and it would not be difficult for him to design a more interesting crown for the church which would not cost more than 2,700*l.*

THE Austrian dramatist LUDWIG ANZENGRUBER was one of the pioneers of realism on the stage. He took most of his subjects from the lives of the peasants, and it was a surprise to playgoers to discover that such a class of *dramatis personæ* could be made interesting. He died in 1889. Vienna possessed one memorial of the popular dramatist, but another has been placed in a fitting position near the Deutschen Volkstheater. It is the work of JOHANN SCHERPE. The sculptor wished to suggest that ANZENGRUBER belonged to the classes who are the substructure of the State. The pedestal is therefore a rough block of sandstone. At foot are stones amidst which appears a figure of HANS the stone-breaker, one of the writer's creations. ANZENGRUBER is represented as if in the mountains. He stands looking towards a distant place with a stout bergstock in his right hand while the left hand holds his large hat behind his back. The statue is certain to be one of the most popular in Vienna.

A CIRCULAR has been issued by Mr. M. B. ADAMS relating to his candidature for a seat on the Council of the Institute. He bases his claim on his services, after twenty-six years as hon. secretary of the Architectural Museum, in originating and carrying through the transfer of the property to the Architectural Association. He desires to still further advance the project. He adds:—"My ambition, however, is to be returned as the nominee of any section of the Institute. The one pledge which I give is my intention, if elected, to advance the highest interests of the art of architecture to the best of my ability." It is desirable to have a Council of a varied kind, and Mr. M. B. ADAMS's acquaintance with the inner and outer workings of architectural practice makes him a candidate who should be able to render useful service.

READING GAS COMPANY'S NEW OFFICES, READING.

THESE buildings have been recently erected. They have a frontage to Cross Street of 102 feet and to Friar Street 40 feet. The basement contains a large room for the larger articles. A strong room, vaulted, adjacent, is provided, so that books, ledgers, &c., may be conveyed from basement to the second floor. Stores, lavatories, w.c.'s, &c., are provided, all well lighted and ventilated by a large open area. Two staircases communicate with the upper floors. The first floor contains a large show-room for lighter goods, such as the different varieties of small gas stoves, and the various forms of incandescent light fittings. A large general office is on this floor, with distinct divisions for the secretary and assistant secretary. A separate office is provided for the prepayment clerk, who transacts all the business connected with collecting money from the automatic penny-in-the-slot meter, and a coat-room filled up with lockers for the staff is provided, and also a cycle-room fitted with stands for each cycle. A separate entrance is provided in Cross Street for this purpose. The main entrance is in Friar Street. The first floor contains a large lecture hall for the practical demonstration of cookery by use of gas kitchen fittings, &c. There are various other offices on this floor for use of the secretary, auditors, typewriter, &c. The second floor contains several offices. On this floor accommodation is provided for the caretaker, comprising kitchen, scullery, larder, pantry, sitting room, bedrooms and bath-room. On the third floor provision is made for various rooms should they be required. The premises are heated entirely by gas as arranged by the company. The materials used are as follows: The entire ground floor is built of "Grey Granite" of a particularly pleasing soft grey color, the whole of it being worked to the architect's drawings in Norway and shipped to England, and carried by the contractor. The remainder of the building consists of cornices, bands, quoins, &c., in Devonshire stone, in heights to equal six courses to the top, specially made red bricks. The circular angle of the roof forms a prominent feature, and is 90 feet in height to the top of the vane. The roofs are covered with the finest quality picked Westmoreland green slates. The doors, windows, &c., are made of teak. The architect is Mr. G. W. WEBB, F.R.I.B.A., Market Chambers, Reading; the contractor is Mr. J. GODWIN, of Reading; the clerk of the works is F. BAKER.

SKETCH OF THE PULPIT IN BAPTISTERY AT PICA.

RECENT EXCAVATIONS IN ROME.*

1898 Commendatore Boni began to excavate the Roman Forum for the Italian Government. It may be said, without exaggeration, that all the remains of classic Rome are most full of significance, and which throw the best light upon the Romans, upon the development of religion, their political institutions and their life, have revealed during the seven years of his work there. The Forum was the centre of every side of the life of the city, its most ancient shrines, its place of political assembly, its judicial tribunals and its best shops were all situated in the narrow and marshy valley which first rose in importance as the common market-place of the small villages set upon the hills in the midst of which it lay. Through it passed the great triumphal processions, and in every class of Romans assembled for social intercourse. The times of the kings and of the republic are those in which the foundations of the Roman power were laid, and the institutions of those times the pure Roman elements which lay at the base of it are to be traced. The centuries of the Empire show us a Rome in which foreign influences and importations had modified, and in great part changed, the true characteristics of the Roman and of his religious and political ideals; it is therefore to the remains of kingly and republican Rome that Signor Boni has striven to reach, and he has striven with a success which has exceeded all expectation.

It would seem that the Latin tribes entered Italy from the north-east corner, and wandered along the low flat coast at 1000 B.C. At last they crossed the Apennines and settled on the western side of the peninsula, rather on low hills rising out of the marshes than upon lofty mountain peaks. They would seem to have been originally lake-dwellers, and the name "Latin" has been derived from *latus*, "the people of the plain." From the volcanic group of the Alban Hills some of them came towards the Septimontium, and communities grew up on the Capitol, the Esquiline, the Palatine, the Quirinal, which about the eighth century B.C. were united into one city by the chieftain of the Palatine, whom we call Romulus. The villagers met for exchange and barter in the valley of the Forum, and so great was the loyalty of the Romans in later times to the traditions of their city that for thousands of years that valley remained, in spite of all its inconveniences, the central point of its life. The Sacra Via, the famous path of the triumphs, and the road where the emperor Nero strolled with his friends, was at first a track across the marsh, passing along its higher and its sunnier side, thus uniting the two chief villages of the Palatine and the Quirinal.

All dwellers upon hills must fetch their water from a spring below, or, rather, they must send their womenkind to fetch it. Under the steep cliff of the Palatine a copious spring rose to the surface, which the Romans called the fountain of Juturna. From it the first Palatine women fetched water in rough earthen jars up to the village, as the women of so many little towns in central Italy do today. When the Romans had learned to dig wells for water the primitive associations of this spring with the origins of the State gave it a peculiar sanctity in their eyes, and it became a shrine of that nature-worship which their allegiance so much longer in its purer and more primitive form than it did that of the Greeks. The Romans had an implicit belief in the curative powers of water, and water was so likely to be beneficial as that of the first great pool of their forefathers? A sanctuary of healing grew up around the place, which became a kind of pool of Bethesda of the city. Varro derives the name of Juturna from *juvare*, "because so many sick are wont to seek the healing of the waters." A number of small arched cells behind the pool were found to contain the statues of health deities and seemed to have formed a kind of open-air hospital.

The story went that Castor and Pollux, appearing from the sky upon white horses, decided the battle of Lake Regillus in favour of the Romans, and afterwards announced the crowning victory over the Tarquins in the Forum, where they washed their horses in the fountain of Juturna. Statues were set up at the place, and numerous fragments of these have come to light there. The sacred pool was placed in the charge of a priesthood, and since it was only resorted to by women, this was very naturally a female one. Close beside it stood the hut of the public fire

from which the same women might fetch embers to rekindle their own hearths, and which was under the care of the same priesthood, the Vestal Virgins. These were "the daughters of the city," and performed for the State all such duties as in each household were performed by its womenkind. They were present at all ceremonies connected with the harvest, they brought the sacred water for expiatory sacrifices, they cooked the sacred cakes of the *mola salsa*, and they kept alight the fire upon the City Hearth. It was this intimate connection of theirs with the corporate State which gave them so deep and abiding a sacredness to a Roman mind.

The Hut of the Fire was called the "Aedes Vestæ," and since it was above all the shelter of the hearth of the city, it kept throughout its many successive rebuildings the circular form of a primitive hut, such as we see in the clay hut-urns found in early Latin cemeteries. The dwelling of the Vestals adjoined it, and close to both stood the Regia, "the royal house," and the dwelling-place of the King and Father of the primitive Family State of Rome. Thus it came about that there grew up in the south-eastern corner of the valley, around the spring, a group of shrines closely connected with the earliest beginnings of the joint city.

In the diagonally opposite, and north-western corner, was the Comitium, or place of political assembling. It was railed off by Tullius Hostilius, who built the first Senate house, or Curia, on the slope of the hill above. In the Comitium stood the platform for orators, which was called the "rostra," because it was decorated with prows of the ships taken in naval warfare. In the Comitium, Boni has explored twenty-three archaeological strata, these being floors laid down one upon another, and each one scattered with relics of the pottery and the sacrifices of the Romans. Several passages from Latin writers agree in stating that there was here, and in close connection with the "rostra," a "Lapis Niger," which marked the site of the tomb of Romulus, which tomb was guarded by two lions of stone (or by one). The famous Black Stone was found in 1899, and is actually a trapezoidal piece of black marble pavement let into the white pavement of the Comitium, undoubtedly in order to hide from view certain ancient and ruined monuments which it covers, while for ever commemorating their position. In order to discover whether a tomb of Romulus did really exist beneath it, Boni dug under the marble, having supported it on iron props. He found there two bases on which the lions may well have stood, together with two broken columns, the one conical, the other pyramidal in shape. Around them lay the remains of a great sacrifice and many votive offerings. Boni's own theory is that during the social wars of the Republic, when the plebeians were attempting to seize a share in the government from the patrician families of pure Roman blood, and when their tribunes appropriated the "rostra" for their own demagogic harangues, the patricians made a violent onslaught upon them. The ancient monuments before the platform were broken, but the plebeians performed a great expiation, and covered down the ruin with black marble brought from Cape Matapan.

The pyramidal column is covered on all four sides by an inscription, written *boustrophedon*, and in Chalcidic Greek; but, in spite of all efforts, only a very general idea of the meaning of this will ever be gathered, since two-thirds of it are broken away.

The period of the Republic has few remains of importance in the Forum which distinctively belong to it, although it is very clear that the notions of the Romans of that most important time in their history, as to religion and as to political aims, are greatly elucidated by the monuments which have just been described. Pavements and mighty drains of Cato and his contemporaries can indeed be pointed out *in situ*, and the latest discovery is one which must not be forgotten. It is the Lacus Curtius. Ovid remarks that in the spot where the gulf opened and closed upon Marcus Curtius, a pavement had in his time been laid down. This pavement, together with two others beneath it, has come to light in the centre of the Forum, and upon it is part of the altar where sacrifice was performed to the Manes of Curtius.

Julius Cæsar determined to put an end to the Republic, and to establish an autocracy based upon a wide democratic popularity. As he planned to transform the State, so he transformed the Forum. The buildings in it, whether consecrated to religious or to political uses, had been orientated according to the sun's course when they were inaugurated by the augurs. Walls and pavements can be seen in every part of the Forum lying below those of the Empire, and set up on these lines. One by one each was rebuilt or changed by Julius Cæsar and by Augustus, and in defiance of the

* A paper read by Mrs. Burton-Brown at the meeting of the City of Arts on May 3.

old customs of inauguration the new imperial Forum grew up, a broad open square following the natural conformation of the valley and the Capitol. This Forum was dominated by the new rostra of Cæsar, from which the orators addressed the mob assembled in the open space, and no longer the free men of the Comitium. It was lined on both sides by the Basilicæ Julia and Æmilia, and at the further end, appropriately enough, stood the Temple of Divus Julius, just behind the altar which Augustus erected on the site of the pyre of the great dictator. The people as they assembled in the Forum saw it surrounded by monuments of imperial magnificence, and the lofty Temple of Julius, together with the triumphal arch of Augustus, shut the primitive shrines of Vesta, Juturna and the Regia out of sight and out of mind. In order to enhance its popularity Julius determined to hold the games on a scale of greater splendour than before. It was difficult, as may well be imagined, to find room for this, and it is now found that he tunnelled its length and breadth by a system of five subterranean corridors. By means of these theatrical properties, fighters and wild beasts were brought beneath the arena, and were hauled up to it by small lifts. There are ample traces of the windlasses by which these were worked. The corridors when found were quite choked with earth and rubbish, and now that they have been cleared they are the most salient proof which could be found of Cæsar's political aims.

Statius tells us that a colossal bronze equestrian statue of Domitian was set up under the emperor in the midst of the Forum. Its concrete base was discovered recently. On searching it Boni found a block of travertine embedded in the concrete. A small hole in the middle of it contained six vases of a very primitive type, a type indeed which was in use, as we have every reason to believe, about the eighth century B.C. Their contents comprised some gold ore. We know that Vespasian in laying the foundation-stone of the Temple of Jupiter placed in it unsmelted precious metals, and there can be little doubt that we have here the remains of the inaugural votive offering of Domitian's monument, contained in what the Romans called "*Vasa Numæ*," i.e. vases made in imitation of those actually in use under the king whom they revered as the founder of the religious institutions of the city.

Outside the Forum a most beautiful monument of Augustus has recently been partially explored by Signor Pasqui, the "*Ara Pacis Augustæ*." It was dedicated in the year 9 B.C. by the Senate, in commemoration of the victories of Augustus, and of the opening of that golden age of peace which it was hoped that they might bring to the Roman world. It consisted of an altar of sacrifice raised on a platform, and surrounded by a marble enclosure wall covered with carvings in relief, both on the inner and outer side. A large number of slabs from this wall have long been at the Villa Medici, others in the Vatican, the Uffizi and the Terme Museum. Only recently, however, has it been recognised that they were connected, and that they belonged to the Ara Pacis, and in consequence Pasqui was entrusted with the further exploration of the site from which they came. Many more fragments have come to light as well as the plinth of the wall.

The outer face of the screen had a frieze which represented a procession of majestic and dignified Romans, led by the Emperor Augustus to do sacrifice at a shrine. They comprise four Flamines and other priests, as well as the ladies of the imperial family, and portrait figures of Tiberius, Drusus and others. The sacrifice is offered by a symbolical figure representing the "*Senatus Romanus*," at a rustic stone altar. The shrine is shown as that of a graceful reclining woman surrounded by the emblems of fertility. She has been usually explained as "*Tellus*," but may equally well represent Augustan Peace, surrounded by the accompaniments of Fruitful Earth. The frieze may be regarded as the marble counterpart of the *Carmen Seculare*, which is filled with rejoicing over the prosperity which was expected as the result of Augustus's rule. This processional frieze challenges comparison with that of the Parthenon, and in the contrast between them lies the difference between the ideals of Greek and Roman. Upon the Parthenon all dignity and majesty is concentrated in the figures of the "deathless gods," the people are full of light-hearted gaiety, and not one of them is individually characterised. The true religion of the Romans was their loyalty to the State and its officials; hence upon the Roman frieze the dignity and clearly-marked personality of the latter is the first quality which strikes the spectator, and the figure of the worshipped is marked by a merely symbolic grace.

Augustus knew how to use every Roman feeling of to early political and religious traditions as yet on aid to his own greatness. He called himself tribu Plebs for life, and associated himself with the inst the Flamines as well as with that nature-worsh as we have seen, had always had so strong a ho devotion of the Roman mind. Where Julius ha grasped at absolutism and had fallen, Augustus bu power by diplomacy and succeeded.

THE "AULD BRIG," AYR.

IF Robert Burns had not written a poem about Brig of Ayr it would at once be demolished on of its dangerous condition and a new bridge subst it. The question of cost need not be considered, fo the Templeton bequest a sum of 10,000*l.* is availab work. But the association between the bridge and is too close to allow of a summary solution of the We have from time to time described the efforts keep the bridge from collapse, but apparently the patching cannot serve. The Ayr Town Council works committee recognise their responsibility as g of the safety of the public and as custodians of a structure. They recently commissioned Mr. John the town surveyor, Mr. John Eaglesham, ex- and Mr. J. H. Morris, architect, to examine and rep the bridge. Then Mr. Hall Blyth undertook to ac sulting engineer, and finally Sir William Arrol, M his advice on the subject.

Mr. Young considers that the south arch should down and rebuilt, reusing the present materials, and suitable; that the three piers be rebuilt from 8 or 10 feet below the present foundations up to t of the arches. A good foundation would be found below the present foundation. A considerable p the facework of the piers had apparently been from time to time with stone and brickwork, a would be no great loss, from an antiquarian point if the piers were entirely rebuilt with new mate was doubtful if the deepening of the foundations rebuilding of the piers and cutwaters, while retai superstructure in position, would be a reasonable, proposal to adopt, in respect that the weight of t structure was about 500 tons. He regretted very necessity of disturbing any portions of the structu the public use of the bridge was to be continued it made secure, doing as little damage as possible an ing every possible means to that end.

Mr. Eaglesham states that he has approached t with a strong desire to retain as much as possibl present bridge. He would strongly deprecate the destruction of any portion of the structure which ciently sound of itself to allow of the continuance o use by the public. He would further desire to ma any feasible means, if not at unreasonable outlay porting and retaining intact the sound portions structure. He is agreed that as a first part of the s rebuilding the three piers of bridge must be rebuilt, and the new piers must be founded from 8 lower than the present foundations. Any portion original ashlar masonry in the present piers w retained and incorporated in the new wor Eaglesham, after very full consideration, sees no saving the south arch of bridge, and is of opinio should be taken down and rebuilt. Its present state clearly proves that movements in the struct taken place, and that the continuance of its us present condition is fraught with danger to the That being admitted, he is of opinion that nothing rebuilding this arch would meet the terms of the Te bequest.

Mr. J. H. Morris says:—"I suggest, in term remit to us, that new foundations and substantia piers are imperative. Regarding the remainder structure, all insecure portions which it is impossib wise to preserve and make secure and serviceabl be taken down and built anew, and all defective or material carefully cut out and renewed. I ap and do not seek to minimise the engineering di involved, but in the face of the many triumphs of e ing skill, I do not think it should be held impossible unreasonable to affirm that the bridge can be subst rebuilt in terms of the remit and on the lines ab lined if once the real value of the ancient edifice

sed and accepted. The bridge is a most valuable most priceless heirloom of the town and of the y, and should not be sacrificed because of the mone- utilitarian considerations. The comparative cost of ilding the bridge as above, and (2) substituting an y new structure, even if in it part of the old material rporated, should, it seems to me, be an entirely ar matter. In support of these views I would point at even if the bridge be wholly taken down and reusing therein as far as practicable the old materials, id no longer be the 'Auld Brig,' or even Burns's but at best merely a new 'auld brig,' and a sham en at that. Further, while new material can, where ary, be fitly added to or incorporated in an ancient hich exists, old and new material can never, in an ogical or even scholarly sense, be fittingly 'built r in a wholly new structure without flagrant offence d breeding. From the point of view of intrinsic hrough the accidents and exigencies of time these monuments are being gradually lessened in number, hose remaining become not only of relatively in- ing, but of almost inestimable value. The intrinsic of the existing structure may be compared to that of re of an old master, an early manuscript, a piece of e silver. Once destroyed they can never be remade, e value of thousands sterling is reduced to nought. For and other similar reasons, which I need not here set l, as an archæologist, strongly advocate the preserva- f such of the structure as can reasonably be made , and to retain, at least in essence, the bridge of and of Robert Burns."

Hall Blyth says he need hardly say that he recog- as strongly as any one the historical and archæological of the old bridge of Ayr, and was as fully impressed e importance of preserving as much of the old are as possible. There were so many national as as local associations connected with it that it was ial that any scheme for reconstruction must be one ould preserve as far as possible the identity of the . It was manifest that the bridge as it stood was better than a ruin, and that drastic steps must be at once if it was to be preserved at all. The piers ow got into a ruinous condition, and the superstructure twisted and distorted from end to end, and from side, as to be quite unstable and unsafe. Nothing have given him greater satisfaction than to be able vise some means by which the bridge could be ed secure as it stood, but looking at the matter as a cal engineer he regretted to say that that appeared to quite impossible, and the question to solve therefore ow the bridge could be secured for all time while still rving its identity. He concurred in the necessity for ding the piers. Before any operations were begun arapets must be taken down, and the roadway, the filling between the spandrels and the cutwaters yed. There would then remain only the spandrel and arches, and these could be treated in two ways— support them on temporary scaffolding, and (b) to take down and rebuild them along with the bridge. To pt to support the superstructure while the new piers being built would be a very difficult and costly opera-

With the masonry in its present condition the est settlement might, and probably would, cause the lete collapse of the arches, and after all necessitate lding. Looking to the fact that they were all of on that considerable portions of the bridge must be ved and rebuilt, he had very reluctantly come to the usion that the only practical and satisfactory method aling with the bridge was to take it down entirely, rving an exact record of the details of every portion ebuild it stone for stone on the new foundations. It t cause regret to some that this course had to be ed, but he was satisfied that when it was completed eneral opinion would be that the right thing had been and if the work was properly and carefully carried e beautiful lines of the original bridge and its pictur- e appearance would without doubt be admired and ed by future quite as much as by past generations.

ir William Arrol writes:—"I have gone into this matter nnection with the old bridge both with Mr. Young and Morris, and there is no doubt but the structure is in a dangerous condition, and in the present state of the es and upper part of the bridge it would be a very ult thing to underpin or repair the pier's without ng the arches stiffened and strengthened to enable to stand the strain that would come on them by the

underpinning of the piers. This underpinning would be a very tedious and difficult job, as the weight of the piers is so much out of proportion to the main part of the bridge. Had the bridge been in a good condition and stiff enough to do the ordinary work for which a bridge is intended, an attempt might have been made to underpin and sink the piers to a greater depth to prevent scour and further damage by the action of the river. The position in which this bridge is placed makes this underpinning very difficult, being practically at the mouth of a tidal river, but it might be attempted and carried on for a year or more; but owing to the frailness of the upper part of the structure the whole thing might collapse when you had one or more of the piers repaired. Looking at all the circumstances of the case, I quite concur with Mr. Hall Blyth's report as being the best in a practical sense. By taking down and rebuilding the bridge, as he suggests, you would then have a substantial structure that would last for many generations to come. As Mr. Blyth points out, the mortar is entirely done, and the slightest movement might cause the whole bridge to collapse at any moment. I think, looking at all the circumstances of the case, both in regard to the opinion of counsel and Lord Low's opinion, and in the interests of all parties from an archæological point of view, and also from the point of utility, that the bridge should be rebuilt. In my opinion the bridge would then be practically as good as new, and at the same time have exactly the same outline and appearance as at present."

On Monday last the subject was again considered, and it was decided that Mr. John Young, town surveyor, act as engineer in the work, with Mr. John Eaglesham, C.E., Ayr, as consulting engineer, and Mr. J. A. Morris, Ayr, as consulting architect in archæological matters. The surveyor was instructed to prepare plans and specification, and issue schedules for tenders, including in his schedules a temporary footbridge for use during the work.

DURHAM CASTLE.

AT the annual meeting of the Durham and Northumber- land Archæological Society the Rev. Canon Greenwell, the president, delivered an address. Last year, he said, they paid a visit to Durham Castle, and were greatly indebted to Dr. Gee for the very interesting and valuable historical account he gave them, an account which he hoped in due time would be put into printed form. They were taken round the castle by Mr. Hodges, who he (Canon Greenwell) expected would bring out a very valuable and exhaustive monograph upon the castle of Durham. Mr. Hodges had been surveying and working for many years, and was acquainted with the castle in all its details. He hoped before long he would bring out this account of their castle, which, it was understood, would be very fully illustrated with views. In speaking of the castle, he might mention that for some time there was considerable fear lest a portion of it should fall—the portion built by Bishop Pudsey. Pudsey's architects, although they were men of very great artistic qualifications, as their buildings showed, did not possess the same amount of skill as his engineers. Nearly all the buildings erected by Bishop Pudsey were on insufficient foundations and showed signs of shrinking. Many of them, in fact, came to absolute ruin. Durham Castle in turn showed signs of shrinking, and it became so serious that it was rendered necessary to carry out some very important and extensive work. The shrinking portion of the castle had now been braced together with iron girders, and they hoped it would stand for many generations to come. Without these alterations the probability was that the Norman gallery, senate room, &c., would have collapsed altogether, and no doubt would have collapsed if it had not been for the gallery of Tunstall, which ran along the lower part and acted as a kind of buttress. Altogether, a very good work had been done at the castle, and the part of the building previously in danger of falling was now being made perfectly stable. Proceeding, Canon Greenwell, according to the *Durham Advertiser*, said he was sorry to say what he understood was going to take place had not taken place. He thought Durham Castle was going to be delivered from being cut up into rooms for the purpose of housing students, but this, it appeared, was not to be. He never could speak of this matter without feeling that some day or other the castle would be burned down. There had already been fires in the castle, but these fortunately occurred in a portion cut off from the rest of the building by a strong party wall, or a very great

part of the castle would probably have been burned down. As it was, the part of the building where the fires took place was entirely and totally gutted. The two fires had taken place in consequence of students occupying rooms at the castle. If a fire took place in the Norman gallery nothing in the world could stop it being burned down together with the back staircase. Nothing, too, would stop it burning the castle hall, and the whole of the building erected by Bishop Pudsey. The Senate and the common rooms would be totally destroyed. He had understood they were going to remove the students entirely out of the castle, but this was not to be. It was a most suicidal thing to have students living at the castle. He only wished Dr. Gee were there that day, and he would then hear what he had to say. He (Canon Greenwell) had protested over and over again, but without avail. People did not seem to have the slightest care for the building of which they were in charge. People who occupied buildings like the castle of Durham, which was full of objects of interest of the highest kind of architecture, ought to guard the building with the greatest jealousy, and ought to do nothing or have anything carried on in it that might cause fire. He did not say students were more dangerous than any other people, but they could quite understand how a man, putting a lamp or candle away in a careless fashion, as some people were apt to do, might set the whole place on fire. They had the fact that two fires, due to students, had already taken place in the castle, and there was ten times more than the mere chance of a further outbreak occurring. Proceeding, Canon Greenwell referred to a number of photographs (produced) of ancient vessels found by Mr. C. J. Gibson, of Hexham, in a cistern near Dilston. These vessels, he explained, were placed in the coffins by the Ancient Britons, evidently for the purpose of holding food for the corpse for the next world. The curious thing about them was this: he had opened several coffins himself, and had invariably found in them, alongside the vessels, a shoulder bone of a pig, from which it was evident the Ancient Britons were fond of roast pork. The President proceeded to refer to a number of local churches, abbeys, &c., which were showing signs of decay, and mentioned Hexham Abbey as a case in point.

A member present said the fund subscribed for the restoration of the Hexham Abbey transept was being used, and illegally used he believed, for the purpose of putting in a new organ.

Canon Greenwell said talking of organs reminded him that Bret Harte once said engines were poison. Archæologists, on the other hand, said organs were poison, for they spoiled the architecture and beauties of many of our churches. Durham Cathedral afforded a case in point. Organs drowned the voices and spoiled the music, and whilst at one time the sexton used to be the authority in the church, it was now the organist who was in power.

A vote of thanks to Canon Greenwell for his address concluded the meeting.

BELFAST CITY HALL.

THE people of Belfast have acquired a reputation for hard dealing and for endeavouring to get the upper hand of those who transact business with them. The new City Hall is not unlikely to afford another example of the peculiar local system. It is generally accepted that the building, when completed, will add dignity to Belfast, but there is also a desire that it should be enduring evidence of skill in bargain-making. The building has been altered from the original plans in order to make it more grandiose. The contractors must be paid for the additional work, but it is now sought by some of the Council to fleece the architect by restricting him to the commission on the original tender. That policy seems to be evident from the following letter to the town clerk from one of the aldermen:—

Belfast: April 27, 1905.
New City Hall.

Referring to the statement I made yesterday at the improvement committee as to the conditions upon which the successful architect should be employed, I now confirm same, a copy of which I read to the meeting. Your statement that Mr. Bretland was only responsible—this I reminded you was not the fact, as at the meeting of the improvement and general purposes committee of June 22, 1896, the conditions and instructions upon which the architects competed were drawn and signed by you as town

clerk, dated June 20, 1896. I distinctly asked meeting in your capacity as solicitor to the Corporation Clause 17 bind the architect that his entire remuneration should be limited to 5 per cent. on the amount of no matter if the new City Hall cost a million of pounds. Your reply was that whoever was employed as architect, matter what extras were ordered or what sum tender accepted was incurred, all the Corporation liable for would be limited to the amount of the tender.

"Instructions to Architect (Clause 17).—That the design which shall be placed first in order of merit be employed to execute the new buildings and unless insuperable obstacles (of which the Corporation the advice of the assessors, shall be sole judge) such employment. In the event of the author of the design placed first in order of merit being employed to execute the buildings as architect, he shall receive as remuneration a sum equal to 5 per cent. on the amount of the sum accepted for the erecting of the buildings. It is to be understood and agreed that this sum will be remuneration, and is to include all professional charges and expenses in connection with the design, supervision and completion of the new buildings, excepting city surveyors' fees and clerk of works' salary, to be paid by the Corporation."

At the improvement committee I was present on January 14, 1899, when it was decided to raise the rate. The following resolution was adopted, so that no doubt or misunderstanding could arise as to fees:—"That the architect be informed that the committee consider the fees of 5 per cent. on the amount of the contract covers the entire of the remuneration on the design, as well upon the plans as any extras that may be authorised," and confirmed by the Council at the meeting held February 1, 1899. At the sub-improvement meeting held March 14, 1899, Mr. Thomas's letter of February 9, 1899, was produced as follows:—

"5 Queen Anne's Gate, London.—Belfast City Council."

"Dear Sir,—I regret to see from the copy of the letter forwarded on the 19th ult. that the committee do not in my views with regard to fees herein. I do not, however, I need say more in this matter now, but I shall have an opportunity of doing so at the conclusion of the meeting when no doubt the committee, after due consideration, will view the matter differently."

(Signed) A. BRUMWELL THOMAS.

This letter is not copied in the book setting of the various facts of the transaction. At the meeting of the improvement committee passed the following resolution:—"Resolved, that the architect be informed in reply that the committee adhere to the resolution of January 14, 1899," and this resolution was approved by the Council on April 5, 1899.

I take it in conformity with your duty to have forwarded this resolution to Mr. Thomas, and I present no reply has been received from him on the subject, which settles all questions of extra fees to Mr. Thomas, as he has gone on with the building under the terms and conditions upon which he was appointed.

At the improvement and general purposes committee meeting held on October 21, 1897, it was resolved that Messrs. H. & J. Martin's tender for the erection of the new City Hall, reducing the item of 10,000*l.* set apart for contingencies to 5,000*l.*, making the sum of their tender 149,854*l.* This resolution was adopted by the Council on November 1, 1897. This change was not put before the contractors who tendered.

On December 18, 1897, at a meeting of the improvement and general purposes committee, the town clerk reported that the conditions of the contract for the erection of the new City Hall had been settled by him, the clerk, and Messrs. Martin, as set out on page 59 of the report. Messrs. H. & J. Martin's contract states the new City Hall should be completed in four years, and they commenced operations in January 1898. From that period (1902) to the present, now over three years, the work has been completed, and alterations made which have saved the city from the most awful calamity. . . . This has been prevented by necessary extras being insisted upon by the Council at the meeting of the improvement committee on April 5, 1899, when a sum of 37,000*l.* was asked for to supply the materials and do other work, I moved an amendment to the resolution as follows:—"That no further expenditure be incurred on the City Hall until we have a full statement of the cost and the cost of all extras and expenditure necessarily ascertained to complete and finish the entire building."

me required to do so, so that the Corporation may what the new City Hall finished complete will cost." Howard stated he would second the amendment, but I did not understand that the resolution was put by the man and carried, to which I entered my protest. As will be no notice taken in the minutes of these facts, I consider it my duty to place the same in writing before you in your official capacity as town clerk and solicitor, so that a record of the facts can be hereafter referred to. It is set out in page 4 of the report, wherein the improvement committee asked for competitive plans not to exceed £100,000 to begin with, now by a system of patchwork the new hall will likely when finished cost 300,000. I was told, as you know, to the rates of the city being saddled with what I all along told you would be the final result, the enormous annual interest and upkeep of such an expensive building, likely costing 15,000. to 20,000. a chargeable upon the rates. Understand, I have no personal feeling against anyone. As a trustee for the rates I deem it my duty to them to record the facts. It is with them to take such steps as they may deem advisable. I find myself powerless to prevent further delay and unknown outlay.

ARTISTS' BENEVOLENT INSTITUTION.

The annual anniversary dinner of the Artists' General Benevolent Institution was held on Saturday, with Lord Chief Justice as chairman.

In proposing the toast of the Institution his Lordship hoped his shortcomings as an artist would not diminish the effect of the claim he was to make. He referred to two cases within his own experience. One was of a sculptor, penniless when he started, who showed ability, and soon rose on the top of the wave making success. He married, and, just as his name was being established, he was stricken down, and dying as a widow and three small children without support. A moment of foresight could have anticipated that terrible calamity. That was the class of case which the Institution did and did aid. He also knew the case of an elderly man who had been successful and had brought up a large family creditably. But his artistic capacity seemed to diminish; he had to live upon his savings, and, finally, he was leaving his family unprovided for. What could be more strongly to successful men than cases like these? Artists were the most unselfish set of men he knew, and the least jealous of each other, but they were not very provident. They were sanguine and—necessarily so, for otherwise they would not be artists—and they were easily led into unwise speculations. Nor did they make the best of their opportunities. There were reasons which showed the necessity for an institution of this kind. A great point in its favour was that its beneficences were distributed with a delicate and moderate hand, for the ladies they aided were such as would not go and beg in public—ladies who would drag on the merest pittance rather than let their sufferings be known. He pointed to the inadequacy of the funds at present for the disposal of the committee, and suggested to successful artists that it ought to be a code of honour with them to support the fund for the assistance of their less fortunate brethren—even to the extent of a tenth of their means.

Mr. Lawrence Alma-Tadema, R.A., responding to the toast of "The Royal Academy and the other artistic Societies," said:—I know there are some who fail to believe in the efficacy of our efforts, but their turn will come. They will probably be told, later on, how inefficient they are, and yet, no doubt, they will be acting in all sincerity to the best of their belief. Therefore, let us continue to live in our own aims and stick to the principles which have guided our lives, never forgetting that, art being needed by tradition, those who come after us will be the outcome of our experience, as surely as we are the result of the gathered experience of those who have preceded us. This leads me to remind you of the great need of our days, namely, education. Let us teach what can be taught, and more than ever doubt that one can give first-class work without knowledge. Individuality, resting upon a foundation of knowledge, will not fail to produce originality, for the same kind of seed sown in different soil will produce different results, while unguided experience cannot produce any result of value. Therefore, let us teach what can be taught in the schools and by

exhibitions. We show thereby not merely the results of modern teaching but also exhibit works of art representative of the efforts of divers countries. These exhibitions enable us to collect moneys for our schools and for yet further exhibitions; the remaining sums we use, as far as in our power lies, to alleviate the sufferings of the less fortunate fellow artists and their families. And in this sense we are a sister body to the Artists' General Benevolent Institution, which has done so much noble work for which we cannot be overgrateful.

Subscriptions to the amount of 3,725*l.* were announced.

BRICKS FOR FOOTPATH AND CARRIAGE-WAY PAVING.*

TO treat this matter exhaustively would take much more time than that at my disposal; but I hope it will be followed up by other clayworkers, and that the result may be co-operation with engineers and surveyors, with the object of producing the best and most suitable goods for their purposes, from which nothing but good could result.

Footpath Paving.

The county of Staffordshire has had a longer and wider experience in this than any other part of England, and the wear and tear on the footpaths there (the population consisting largely of colliers and ironworkers) is severe; yet nothing has been found to compare with good blue bricks in price, easy laying and removing, or wearing qualities.

The first essential is the right material which will produce a tough and hard brick, and this must be treated in a way to develop its best qualities and avoid the defects which in many instances have given paving bricks a bad name. The firing must have the most careful attention, or in this process the best of material treated by the best methods will be rendered worthless for paving.

It is necessary to have a clay which will stand a high temperature before fusion, viz. one which is highly ferruginous having a low proportion of alkalies.

It will be understood that I am dealing only with bricks which are made blue by the action of fire alone (a large quantity of artificially blued bricks are made in districts which do not possess a blue burning clay, and which are naturally very inferior).

Bricks are often specified to be blue through, and to this may be traced many failures to produce a good brick, and in many cases bricks have been rejected which did not answer this description in favour of bricks which did, though the latter were in every way inferior. We find that to blue (or, more correctly speaking, black) through a brick burns the nature out of the clay and renders it brittle and often spongy, and under some conditions might simply mean that the carbon had not been carefully burnt out of the clay.

Laying.

The subsoil being made solid, a bed of screened ashes is all that is necessary. The bricks lay and wear most evenly when laid herringbone, with one or two courses parallel to the path on both sides, with angle-pieces specially made to join up to these. Grouted in with fine ashes, and a sprinkling of ashes being thrown over the finished pavement, it is ready for traffic, which will soon wear the ashes into the joints and make a perfect grout. Sand and cement are sometimes used for setting, but it is an unnecessary expense.

Blue bricks are sometimes objected to on account of their sombre appearance, but this is preferable to the appearance of a light-coloured pavement in bad weather. A good hard brindled would give a mottled appearance, and may be preferred by some, while a hard red is preferred by others, but greater care would be necessary in selecting red bricks to avoid soft ones, and in any case their life would not be equal to that of blue. Good blue bricks may be relied upon to last for forty years without repair under the heaviest wear, and may last very much longer.

I am anxious not to overstate the value of bricks for roads, and do not claim that they are suitable for the severest traffic at present; but for residential areas, or streets where the traffic is not both heavy and quick, cattle markets, goods yards, tramway depôts, back cartways to houses, crossings, cab-stands, &c., they possess some advantages over any other kinds of paving. They give a perfectly true surface,

* From a paper by Mr. A. E. Blizard, read at the Conference of Municipal Engineers on the 5th inst.

are most sanitary (being non-absorbent), are easily washed down, are not more slippery wet than dry, give a good foothold for horses (having rounded arrises), are not as noisy as stone or granite setts, and will stand a great deal of wear; but that is the point upon which I am sensible that surveyors will require to be satisfied.

A brick-paved street may be repaired more cheaply than any other; and with a cement filler no special apparatus is required, as for pavements where asphalt or pitch is used; and the offensive smell of the latter is avoided.

For bicycles, motors and all india-rubber tyred vehicles, bricks are preferable even to asphalt, for with the latter there is a certain amount of suction on the tyres, which in the case of bricks is broken by the rounded arrises; and now that horse-drawn traffic is so rapidly being superseded by motor-driven, this is another point in favour of brick paving.

To give bricks a fair test they must be well laid, and the standard specification for the construction of brick streets adopted by the committee appointed to consider the matter in the United States of America is as follows:—

Standard Specification.

Substructure or Grading.—Earth in excavation to be removed with plough and scraper or other device to within 2 inches of sub-grade, then brought to true grade with the roller, the weight of which should not be less than 5 tons nor more than 8 tons. If the earth is too hard to receive compression through the weight of the roller, then loosen the remaining 2 inches with a pick and cart away. Earth in embankment must be applied in layers of 8 inches in thickness, and each layer thoroughly rolled; and in both excavation and embankment the sub-grade must have a uniform density. If the ground is a spouty clay, tile drainage should be provided to carry off the accumulation of wet.

Channelling.—If cement is used it should be completed; if stone, all should be hauled and distributed and set before the grading is finished, and it may then be used as a guide to finish the sub-grade.

It should range in thickness from 4 inches to 6 inches, and from 20 inches to 24 inches wide, the business and street traffic governing the same, and the lengths should not be shorter than 5 feet except at closures. The top to be neatly dressed with a square or rounded outer edge, and 4 inches down on the inside. The outer surface to be tool-dressed to the depth of the face exposed and to the depth of the thickness of the brick and sand cushion.

The intersection at street corners and alleys should be circular with radius of 4 feet and 3 feet respectively.

Curbs should always be of a hard and durable character of stone, and from 14 inches to 18 inches deep, dressed on top and 5 inches down the face next to the brick, and should be set accurately, to fix the curvature of the cross-section of the street on 6 inches of concrete, and backed up with the same within 6 inches of the top.

Concrete Foundation.—Crushed stone should be of approved quality of hard rock, with no fragment larger than will pass through a 2-inch ring and none smaller than will pass through a 1-inch ring in their longest dimensions, free from all refuse and foreign matter.

Sand.—Must be clean, sharp and dry and thoroughly mixed in its dry state until the whole mass shows an even shade, with an approved brand of either hydraulic or Portland cement. If of hydraulic, the proportion of mixture should be one part of cement and two parts of sand; if of Portland cement, one part of cement and three parts of sand. To the above mixture should be added sufficient clean water to mix to a plastic mass, fluid enough to rapidly subside when attempting to heap to a cone shape. To this mixture add four and five parts respectively of damp crushed stone or clean screened gravel, and turn the whole mass over not less than three times, or until every fragment is thoroughly coated with the cement mixture. For the reception of this mixture the grade should be set off in 5-foot squares, with a stake at each corner. Tops of each should be at the surface of concrete, which must be tamped until free mortar appears at the surface. Occasional sprinkling in extreme hot, dry weather is beneficial. After 36 hours the cushion sand may be spread.

Sand Cushion.—Sand should be clean and free from foreign or loamy matter. It need not necessarily be sharp. It should be 2 inches thick before the compression of the brick by rolling. The sand should be spread, by the aid of a template, the whole or one-half the width of the street,

and made to conform with the true curvature of cross-section.

Brick.—The brick should all be hauled and laid inside the curb line before grading is finished, or by the engineer, delivered on the street in waggons or carried from the pile or waggon on pallets or wheels and not wheeled with barrows. They should be and thoroughly vitrified, showing at least one fair face, with rounded edges, with no greater radius than sixteenth of an inch. They should not be less than 4 inches by 8 inches, or more than 3 1/4 inches by 9 inches, free from cracks, with lamination, and at least one edge with marks allowed. Such bricks or blocks shall be to a test of one hour in the National Brick Manufacturers Association standard rattle and under the conditions prescribed by that association; and if the loss by during such tests exceeds 20 per cent. of the original weight of the brick tested then such bricks or blocks shall be rejected.

Bricklaying.—Bricks should be laid perpendicular to the curb. Broken brick or block can only be used in joint in starting courses or in making closures. Bricks shall be laid on edge, close together, in straight line the roadway between gutters. Gutters shall be cut as directed by the engineer. After the bricks are laid they shall be thoroughly inspected, and all warped, soft bricks removed and replaced by more perfect ones. Those found with the bad face up should be turned.

Tamping and Rolling.—After the inspection is completed the edge of the pavement shall be tampered next to the curb, to the width of 6 inches or out from the curb, with a hand tamper. The pavement shall then be rolled with a 5-ton steam roller. Bricks are thoroughly bedded and the whole assumes a practical plane.

Expansion Cushion.—An expansion cushion must be provided for of 1-inch thickness next to the curb, filled with thirds of its depth with pitch, the top one-third bedded with sand, and a like cushion at right angles with at intervals of 50 feet.

The Filler.—The filler shall be composed of each of clean, sharp sand and Portland cement. The mixture should be dry. The mixture, not exceeding one-third of the sand, together with a like amount of cement placed in the box and mixed dry until the mass assumes an even and unbroken shade. Then water shall be added forming a liquid mixture of the consistency of thick cream. From the time the water is applied until the last is removed and floated into the joints of the brick the same must be kept in constant motion. The mixture shall be removed from the box to the street surface by a scoop shovel, all the while being stirred in the box as it is being emptied. The box for this purpose shall be 3 feet 6 inches to 4 feet long, 27 inches to 30 inches wide and 14 inches deep, resting on legs of different lengths so that the mixture will readily float to the lower corner of the box, which should be from 8 inches to 10 inches above the pavement. This mixture, from the moment it touches the brick, shall be thoroughly swept into all the joints. Two such boxes shall be provided in case the width of the street is 20 feet or less in width; exceeding 20 feet in width three boxes should be used. The work of filling the joints should be thus carried forward in line until an advance of from 15 to 20 yards has been made, when the force and appliances shall be turned back and the same space again in like manner, except that the force for the second coating may be slightly thicker than the first. To avoid a possibility of the grout thickening at any one place there should be a man with a large sprinkling can, perforated with small holes, sprinkling gently the joints ahead of the sweepers. This should be done in the proportion of each course specified. After the joints are filled flush with the top of the bricks, and sufficient time for evaporation has taken place, so that the coating will not absorb any of the mixture, 1/2 inch of sand should be spread over the whole surface, and in case the work is subjected to a hot summer sun, an occasional sprinkling sufficient to dampen the sand, should be followed once or three days. The grouting thus finished must be absolutely free from disturbance or traffic of any kind for a period of ten days.

What is now required is a fair test, on the line of the specification given above, on the whole length of the street where traffic is not too severe. There are a number of blue brick-makers capable of supplying any demand.

standard specifications and tests may be adopted by municipal engineers and surveyors in conjunction with the Institute of Clayworkers before any attempt is made to use bricks on a large scale.

Here we offer a suggestion by which the cost of providing a brick pavement in small country towns may be reduced, viz. by paving only the centre of the roadway, leaving room for two vehicles to pass, grassing the remainder on each side; sewer, gas and water pipes, &c., if laid on the side of the paving, could then be reached at any time without disturbing it, and a good track would be provided for horses. Then the dust nuisance, about which there is so much now, and which cannot be avoided on unpaved roads, would be obviated.

We would like to refer again to cattle markets, for which, as far as one will find any difficulty in recognising suitable as an ideal pavement. At present they are paved with cobbles, concrete, asphalt or stone setts, for the most part. Cobble gives good footing, but is either dusty or uneven and most insanitary. Concrete and asphalt do not give good foothold, cattle often falling and bruising themselves, whilst they have a very short life compared with stone setts. Stone setts are most uneven for cattle to walk upon, and do not drain off thoroughly. Bricks are not so absorbent, can be hosed down, drain off perfectly, give a level floor to stand upon (the rounded arrises give good foothold) and will undoubtedly wear for this century for generations when laid on concrete.

THE BOLOGNESE TOWERS.

Two of the most remarkable edifices in Bologna are the watch-towers. During the twelfth century, when the cities of Italy, "tutte piene di tiranni," were rivals in arms as well as in arts, watch-towers of considerable elevation were frequently erected. In Venice, in Pisa, in Cremona, in Modena and in Florence these singular structures yet remain, but none are more remarkable than the towers of the Asinelli and Garisenda, in Bologna. The former, according to one chronicler, was built in 1109, while other authorities assign it to the year 1119. The Garisenda was constructed a few years later, has been immortalised in the verse of Dante. When the poet and his guide are led up by the huge Antæus, the bard compares the huge stature of the giant to the tower of the Garisenda, as the spectator stands at its base while the clouds billowing from the quarter to which it inclines, appears to billow upon his head. The tower of the Asinelli rises to a height of about 350 feet, and is said to be 3½ feet out of the perpendicular. The adventurous traveller may climb to the top by a laborious staircase of 500 steps. The view presented at the summit comprises Imola, Ferrara and Ravenna, as well as the hills about Verona, Mount Baldus, and the Apennines seeming to rise abruptly from the dead flat which covers the three sides of Bologna. On the south are the very pleasant hills with villas. The Garisenda tower, leaning probably by the family of the Garidendi, is about 10 feet out of height, and inclines as much as 8 feet from the perpendicular. It has been conjectured that these towers were originally constructed as they now appear, but it is difficult to give credit to such a supposition. According to tradition the leaning of these towers has been occasioned by the sinking of the earth. Garisenda stoops so much that the perpendicular let fall from the top will be 7 feet from the bottom of it; and, as appears from examination, when the tower bowed, a great part of it went to ruin, because the ground on that side that inclined stood on was not so firm as the other, which may be said of all other towers. The tower of St. Mary Zobenica, at Venice, leans considerably to the side. So also at Ravenna is another stooping tower, leaning on the ground on that side giving way a little. The whole structure of the Garisenda stooped, much as it does, as appears by the top of it.

A party of members of the Edinburgh Architectural Association visited Niddrie Marischal on Saturday. It belonged to the late General Wauchope. The old tower was built about 1600, and converted later into a spacious staircase to serve the south wing, which was built by Sir John Wauchope, who succeeded to the estate about 1632. Sir John afterwards decorated the dining-room ceiling, still remaining, with devices in honour of Charles II.

R.I.B.A. Council Elections.

SIR,—Will you allow me to thank my many correspondents from all parts of the country who have sent me their promises of votes and support as an independent candidate for election on the Council of the Institute? May I urge, whatever the result of this important election, that every single individual member should record his vote in the interest of all that is best for furthering the advancement of the art of architecture and of those who practise the art, irrespective of party politics. This is the one aim which I have in view, and I am the sole candidate whose nomination was signed by two eminent R.A.'s.—Yours obediently,

MAURICE B. ADAMS.

Edenhurst, Marlborough Crescent, Bedford Park, W. :
May 11, 1905.

SIR,—That small minority forming the anti-registrationist body of the Royal Institute, still suffering from the shock caused by the slaughter amongst their ranks at the last elections, realise that their only hope is to adopt the electioneering measures which they so mercilessly condemned in their opponents, and appeal to the electorate for its vote and support. This minority has issued a circular intimating that the "leading architects" (under which vain-glorious heading it must be inferred the signatories class themselves) are the only persons through whom the Institute can ever hope to maintain its dignity or conduct business of "the nicest and most delicate nature." This is their platform. It looks new, but it is only the old worm-eaten platform the remnants of which have been fished out, patched up and ill-disguised by a clean coat of paint. In short, they invite the electorate to return to the old "do-nothing" policy and all will be forgiven.

Not a hint is given in their circular that any one of those subscribing are in any way predisposed to registration even as a principle. It is considered sufficient that they dub themselves "leading architects" and that they promise to be very nice and delicate, and above all dignified, dignity of course being a quality incompatible with the holding of registrationist views. Think how important it is that the Turveydrop manner should be well in evidence at the forthcoming international congress of architects, which is casually referred to in the circular. Here is exhibited a thinly-veiled dread that the registrationist party will, at the time of this great congress, be still in power, and will grasp the not-to-be-missed opportunity of bringing the registration question prominently forward, of passing a monster vote in favour of the movement, of presenting a memorial for signature by practising architects. The opponents of registration have realised, perhaps more keenly than its supporters, the bearing which this great congress may have upon the realisation of events. The last Council elections transformed that body from a coterie which persistently ignored the wishes of the majority into a body representative of those desires, a body which in one year of office has practically completed the draft of a registration Bill, a body which should be again returned in order that it may continue the good work. It therefore behoves every good registrationist to cast his votes only for those who are declared partisans of the movement and have proved their sincerity by positive and energetic action on the late Council.—I am, Sir, yours faithfully,

ANTI-STAGNATION.

SIR,—In the circular issued by Mr. George Aitchison, R.A., Mr. J. Macvicar Anderson, Sir William Emerson and Sir Aston Webb, R.A., all past-presidents of the Institute, occur these words:—"It appears to us of the greatest importance that the members of its Council should be representative architects of the highest standing, whose names are well known to the profession and the public, for without the experience and assistance of such men we are convinced the work of the Institute cannot prosper or confidence in it be maintained," and they "urge the importance of selecting only the most representative men as members of its Council, in whom all can have confidence while this important question (compulsory registration of architects) is being considered. If this is not done, we are convinced a very serious crisis will arise in the affairs of the Institute, which will paralyse, if it does not wreck, its usefulness, and thus defeat the object we all have in view, i.e. the

advancement and the highest interests of the art of architecture."

These are weighty words, and it behoves all members to weigh them well if they seek to advance the highest aims of the Institute; to record their votes in accordance with the advice given and to refuse their support to those candidates whose avowed aim is to force through the compulsory registration of architects under parliamentary powers.

I have voted in every election since I was elected a Fellow, and have sometimes been surprised at seeing the names of those nominated and elected, but never have I been more surprised than in the *personnel* of the present Council. When the list came out it appeared to me, and to many, I venture to think, as a veritable *débâcle*, when men, by no means "representative architects of the highest standing," occupied the seats of many who were.

To those entitled to vote and who have not yet done so, not knowing among the extensive list of candidates this year against whom to place a X, I would suggest that the circular issued by Mr. W. Gillbee Scott offers some valuable hints.—Yours obediently,

COLE A. ADAMS.

COLE A. ADAMS.

SIR,—The alteration of the Council last election must have been to the interest of the profession. For proof of this see the consternation caused and the keenness being shown by those architects who come under the dignified title of "the leading men of the profession."

Apologising for trespassing on your space.—I am, &c.,
NEW BLOOD.

GENERAL.

Lord Avebury has been re-elected the president of the Society of Antiquaries. Mr. Philip Norman will be treasurer, and Mr. F. G. Hilton Price a director.

Messrs. Bryan & Roberts, Weston-super-Mare and Taunton, were the successful architects in a competition restricted to architects practising in Somersetshire, including Bristol, for the erection of new Council schools at Taunton for 800 children. No premium is given, but Messrs. Bryan & Roberts will carry out the work at a commission of 5 per cent.

The Chailey Rural Council have granted a certificate for the occupation of Sir William Grantham's cottage at Barcombe.

Mr. Vernon Hodge, Teddington, has been awarded the first premium in a competition for a Carnegie free library at Wrexham. Mr. Willink, Liverpool, acted as arbitrator in connection with the 104 designs submitted.

Mr. F. J. Edge has, it is said, resigned the post of city engineer to the Newcastle-on-Tyne Town Council in order to act as consulting engineer to a private firm.

Sir Edward Poynter, president of the Royal Academy, left London on Saturday for Constantinople, where he intends to make a stay of some duration in search of subjects for his canvas.

A Small Roman Coffin has been presented to Colchester Museum, which, from perforations in it, had evidently been used as a sink.

The Streets Committee of the Bolton Town Council have resolved "That all architects and builders submitting plans to this committee be informed that in future all cross sections to houses shall have the levels of front and back streets shown thereon."

Mr. H. R. Hall, M.A., will on Tuesday next read a paper on the "Excavation of the Oldest Temple at Thebes" before the Applied Art Section of the Society of Arts.

The District Council of Altrincham, Cheshire, have accepted the plans of Mr. Wm. Owen, Duchy Chambers, Clarence Street, Manchester, for the erection of a hospital for infectious diseases. The designs were submitted in limited competition, and were awarded the first place by the assessor, Mr. Frank Briggs, Liverpool.

An **Imperial Museum** of fine arts is to be erected in Moscow in memory of the late Czar Alexander III. The building will be modelled in close imitation of the Pantheon at Athens.

H.M. Board of Works have now definitely taken over the ruins of the ancient Edwardian walls of Berwick-upon-Tweed, which stand outside the present Elizabethan walls which completely encircle the Border town. The Edwardian

walls include the bell tower from which apprised the town of the approach of the Scots. of Works will appoint a local committee to walls, and a guide and custodian.

The Total Number of works purchased Chantrey Trust, including this year's purchase of these 88 are oil pictures, 12 water-colours, 9 sculptures in bronze, 6 in marble. The leaving out of account Mr. F. Cadogan Cowper's *Prison*, is 67,018*l.* 15*s.*, or an average of about 1*l.* 10*s.* for each.

The General Purposes Committee of the Council, in a report concerning the memorial presented by architects as to the preparation of plans for new buildings, recommended that no alteration be made in the present practice followed in preparing such plans. The Mayor, when the report was discussed, said it was convenient to the Council to have advice upon such points from permanent officials. In cases where it was requisite an outside architect's assistance had to be obtained. The report was adopted.

The Customary Book of the city of Norwich of the MS. books of the Corporation, has been and steps have been taken to secure its retention and custody in the muniment-room in the municipality. The holder being struck by its antiquity, showed it to the librarian at the free library. The book was identified and secured for the city. The book has long been in the city and was not included in the last list of city documents compiled, as it was not expected that it would ever be replaced. It dates from the reign of Edward I.

The Four Niches in the wall of York Minster the late Archbishop Thomson's tomb and the south aisle of the choir, have been filled with statues of St. John, St. Simeon, St. Ann and St. Cecilia. They have been designed by Mr. G. F. Bodley, A.R.A., and executed in Tadcaster stone by Messrs. Farmer & Brindley.

Mr. A. Hodgson, metalwork instructor under the County Council, has been selected by Sir Philip the request of Johnson Pasha, for appointment Egyptian Government as foreman instructor in the ing section of the model workshops at the ne Assiout about to be opened. Mr. Hodgson has for Alexandria.

A Memorial Statue of the late Queen Victoria unveiled in the grounds of the British Legation at
The commission was given to Mr. Alfred Gilbert

The Shropshire County Council having failed terms with the Shrewsbury Corporation with respect to Shire hall, have decided to take the steps necessary for the erection of new county buildings. A sum of £100,000 has been offered in full discharge of all claims.

Mr. W. A. Pite (Messrs. Pite & Balfour) has been awarded the first place in the competition for the new King's Hospital, on the advice of Mr. Rowland Plumb, who has been appointed architect by the removal committee.

The British Fire Prevention Committee's test will shortly be moved from Bayswater to a site with access from the West End. All the testing chambers erected at the new station will be of the larger type adopted by the committee, with provision for division into compartments.

Messrs. Groome & Bettington, architects and Hereford, have been instructed to carry out the for the extension of the Wesleyan church, Brid Hereford.

The Bucks County Education Committee rec-
sets of drawings for schools in Aylesbury and V.
Mr. T. W. Cutler has made the following award:
premium: Messrs. John Moir Kennard & Har-
nard. Second premium of 25*l.* to be divided jointly
Mr. Alfred Hendy and Messrs. John Cash & M.
Elementary school, Wolverton.—First: Messrs.
ton, Ley & Kerkham. Second: Mr. F. T. H.
Secondary school, Wolverton.—First: Messrs. H.
Ley & Kerkham. Second: Mr. G. Sedger. The c-
regret that it will not be possible to arrange a pub-
lication of the drawings.

The Non-Provided Schools in the West Riding 300, and the average outlay required for additional improvements is 400*l.* per school. There are schools which will require 147,250*l.* to be expended on repairs.

THE WEEK.

THERE may be some exaggeration in the paragraph which has appeared in the papers about the valuation of the parish of Sittingbourne, in Kent, having been returned at 10,000*l.* above the normal amount. But the possibility of such an error will be admitted by anyone who has given attention to the manner in which property is assessed for taxation. It is commonly believed that ordinary men are as competent to determine the value of buildings and lands as to try complicated cases as jurymen. Both offices are supposed to need no training. The decision is arrived at through a process of muddling. Revising assessments gives an opportunity for the display of friendship, and unless we are mistaken there is not a valuation list in England which does not bound in anomalies, some properties being assessed far below their value, while for compensation other properties are mulcted heavily. The local authorities of Sittingbourne might be imagined to possess sufficient interest in the public welfare to recognise that the valuation was in excess; but there, as elsewhere, the men who hold office are regardful of their own convenience rather than that of the people who elected them. The district has suffered by having to contribute to the County Council on the erroneous total, but the sufferers are not those who perpetrated the blunder and who approved of it. It must be expected that irregularities will arise while public bodies are afraid to employ trained valuers.

THE series of water-colour drawings by Mr. ALBERT GOODWIN, which is now on view at the Gallery of the Fine Art Society, deserves the attention not merely of amateurs but of all lovers of English cathedrals. Most of the buildings are found in positions which are attractive, and this fact has been emphasised by the artist. He does not represent the buildings with that anxiety for accuracy of detail which sometimes mars the effect of drawings by other artists. The cathedrals are not taken by themselves, but as the most important element in a scene which the artist can make beautiful by his interpretation. If the churches lose in one way they gain in another, for it must be admitted it is sometimes preferable to see a building from a distant point of view than in a formal close. Here and there Mr. GOODWIN may have exercised the artist's privilege and adapted the environment to suit a cathedral. But in all cases he has been reverent in his treatment of the buildings.

THE promise which was made in the House of Commons that an inquiry should be held into the financial position of the Royal Hibernian Academy must be advantageous to that institution. When the Academy was made public property by FRANCIS JOHNSTON, the architect, at whose expense it was erected, the premises were sufficiently large to accommodate the pictures which were then produced, as well as students of art. But it must now be considered as a public building, and as such there can be no doubt about its inadequacy as a gallery for exhibitions or as a school for art. If the Irish people were generous in buying pictures, we have no doubt the artists would imitate the founder and contribute towards the improvement of the premises. It is, however, doubtful whether on such a site the Academy could be transformed sufficiently to do justice to whatever is hung on the walls. The accommodation for classes is not equal to that provided in the ordinary art schools of English country towns. The erection of a new Academy would no doubt be an advantage, for under the altered circumstances the paintings would look better than in the Abbey Street building. But until wealthy Irishmen will imitate the example of Scotsmen, and purchase

pictures out of the exhibitions, the gain to art and artists will be of little account. If the inquiry were conducted by men of business who were free from official theories they would be likely to come to the conclusion that any machinery for galvanising art in Ireland was only continuing "a delusion, a mockery and a snare." One of the Irish members told the House that the career of HOGAN, one of the greatest sculptors of the nineteenth century, showed what Irishmen could do in sculpture and painting if only means were provided for the encouragement of those arts in Ireland. Yet when HOGAN died he had not one commission, and if the Government had not come to their rescue his family must have gone to the workhouse. It cannot be expected that taxpayers in general should provide means to compensate for the indifference of Irishmen to men of genius when they are born amongst them.

AFTER the remarks which were made by the standing committee of the House of Lords on the Workmen's Compensation Bill, it may be assumed that the new measure is doomed to failure. Lord CROSS, the chairman, considered that the Bill ought not to be allowed to go before the House of Commons if unaccompanied by the Acts of 1897 and 1900, and information relating to the additions, omissions and substitutions in the new Bill. The task which will be thrown on workmen and employers will become more puzzling, and it will be vain for them to attempt, what was originally intended, to interpret such an obscure measure for themselves. The consequence is that more litigation than ever will arise, and it may be concluded that the result to the workmen will be even less satisfactory than it has been. The comprehensiveness aimed at will only increase the obscurity, and employers are likely to become so alarmed they will be still more exacting about the age of each workman who accepts work from them.

SECTION 14 of the Factory and Workshop Act, 1901, confers a piece of jurisdiction upon the County Court which the High Court does not possess. That section, in effect, provides that the sanitary authority shall see that all factories are provided with proper means of escape in case of fire, and empowers it, in case a factory is not so provided, to serve on the owner of the factory a notice specifying the measures necessary to be taken, and requiring him to take them. The owner can then, notwithstanding any agreement with the occupier, take the necessary steps to comply with the requisition. If the owner alleges that the occupier ought to bear any part of the expense he may apply to the County Court, and the County Court may make such order as appears to be just and equitable under the circumstances of the case. In the case of *HORNER v. FRANKLIN* the Court of Appeal has explained the meaning of this clause. In the first place, an application under the section must be made to the County Court. That is the only Court which has jurisdiction under the section. In the second place, the owner must bear the expense. If he wishes to shift the burden to the occupier he must make an application under this section. In the third place, the duty is upon the owner to bear these expenses, notwithstanding any agreement by the tenant to pay taxes or outgoings, except in so far as that duty may be varied by the County Court Judge. In the fourth place, the County Court Judge, in considering what is just and equitable under the circumstances of the case, must bear in mind not only the terms of the lease, but also all other matters—such, for instance, as the length of time which the lease has still to run—in coming to a conclusion upon the subject. We have pointed out before now (*The Architect*, March 11, 1904) the injustice often done to tenants by the wide construction put by the Courts upon covenants of tenants to pay rates, taxes and other outgoings in these days of sanitary and other similar legislation. We should like to see the principle of the clause extended to other cases of necessary improvements effected by order of public authorities.

SCULPTURE AND ARCHITECTURE.

THE absence of Mr. A. GILBERT, R.A., and Professor LANIERI from the meeting of the Institute on Monday prevented the discussion of the subject of sculpture in relation to architecture at the length which was desirable. Mr. STIRLING LEE has suffered through his devotion to the sculptor's art, and was, therefore, entitled to be heard; while Mr. REYNOLDS STEVENS is a master of decoration, and can with equal ability employ sculpture and painting, but the expression of more experience on the subject was desirable.

It is beyond doubt that sculpture, and especially as a mode of adorning buildings, is now receiving greater attention than formerly. There is not, it is true, more than one example to be found this year in the Royal Academy, viz. Mr. PAUL MONTFORD's group for the Town Hall in Cardiff. But we can see both in London and in the provincial cities that the value of architectural sculpture is being recognised. The fact, too, that a public gallery for sculpture has been established in so remote a place as Aberdeen is also an indication that ordinary people can find interest in moulded as well as in painted figures. It would of course be more satisfactory if sculpture could be appreciated in Great Britain as it is in France, Germany or Italy. However, when all the circumstances are considered, there can be no question that much has been gained, for sculpture now occupies a position which would have been thought unattainable half a century ago.

If we examine the causes which have led to the undervaluing of sculpture we may, in the first place, mention the Puritanic fear by which statues became idols. When we now read in an entry dated September 26, 1351, of the payment to "WILLIAM of Padyngton, for making twenty angels to stand in the tabernacles, by task-work at 6s. 8d. for each image, 6l. 13s. 4d.," we are amazed at the moderate cost. We cannot imagine that the people who looked on WILLIAM's figures were more debased by doing so than he was in creating them. But such is the weakness of human nature, it was supposed that figures, whether in brass, wood or stone, were agents in making those who gazed upon them superstitious. Representations of angels and saints were prohibited in churches. But mythological and allegorical figures were received with welcome. FLAXMAN was a very sensitive man on the subject of religion, and although he praised Mediæval sculpture, he never suggested that Christians were liable to perdition by admiring it.

The prejudice continued during many years, and it cannot be said that it has yet come to an end. One consequence was that when sculpture of an important class was desired in this country it was necessary to have recourse to foreigners. Without going very far back, LE SŒUR was a Frenchman, CIBBER was a Dane, GRINLING GIBBONS, although born in Spur Alley, was the son of a Dutchman, RYSBACH was a Fleming, ROUBILLIAC was a Frenchman, and other names could be cited. Native bust makers alone could reckon on being able to live in England. Larger works might be considered as one of the results of campaigns. St. Paul's is evidence of that fact, for the war with France undoubtedly gave an impetus to sculpture.

With such works it never was realised that sculpture should be of a relative or subsidiary nature. The sculptor treated his figure as if it were to be a thing apart, and when it was intended to adorn an interior no thought was given to the building. The men who produced the astounding works in Westminster Abbey were regardless of scale, style and consistency. A Gothic memorial for a general, or a judge, or a beloved wife would have

then been regarded as worthy only of barbarians. If the sculptors had practised more in reliefs they would, no doubt, have been compelled to give consideration to architecture. One of our debts to JOHN FLAXMAN arises from his efforts to make people comprehend the importance of reliefs as architectural adornments.

When we speak of the advantages of sculpture it is well to have it understood that it is not essential to architecture. The Parthenon, no doubt, was a glorious temple, but there existed at the same time Doric temples which were impressive, although neither friezes, pediments nor metopes were adorned. The Greeks were to a great extent utilitarians, and if they employed sculpture it was because it served a definite purpose. In the Parthenon the figures were made to illustrate the influence of the goddess to whom the temple was dedicated, and possibly they also suggested that several of the inhabitants of Olympus took an interest in the periodical ceremonies in honour of ATHENÆ. There was some excuse when DECIMUS BURTON, the architect of the Athenæum Club in Pall Mall, employed the processions to adorn the exterior of the building, for the name indicated that the goddess was respected by the members, and when the bishops made no protest there could not be much danger of idolatry. But it would have been preferable if BURTON had commissioned an English sculptor to represent equestrians on the entrance to Hyde Park, instead of repeating the Panathenæic procession. In Athens the figures must have been infinitely more expressive than in London.

In architectural sculpture the cue ought to be taken from the Parthenon and the subject selected should indicate the use of the building. It is not necessary, nor is the sculpture improved if this is done with elaborate obscurity. The panels which Mr. STIRLING LEE has placed outside St. George's Hall, Liverpool, are excellent if we consider them simply as figures. But their meaning is not clear to the public, and that we believe is the main cause of the delay in commissioning the complete series. Another prominent case, although it is an example of simple mosaic rather than sculpture, is to be seen around the Albert Hall. The building was erected as a concert hall, and the simplest way of suggesting its purpose would be by figures of musicians. Instead, we have representatives of various industries, as if the building were a great technical laboratory. Figures that have meanings which are only known to the initiated may serve in private galleries. But they are out of place as accessories to a building. It may seem to be an unworthy office for sculpture to serve as if it were a sign-board. Men, however, have not as yet sufficiently advanced to consider that a building should be merely a sort of pedestal for a work of sculpture. It cannot be forgotten that sculpture is only an accessory, and when seen in a building it is supposed to explain or glorify the architect's work. This can be done without any loss of quality. The relief we see on the Royal Stables, Buckingham Palace, would receive attention in any place, but in its present position it acquires a fitness which would not belong to it if exhibited in a gallery of sculpture. Without the relief the buildings might not be considered as stables. But, seeing it, there can be no doubt on the subject.

The stables relief suggests another consideration. Although it is near the ground, the figures are modelled in bold relief. Of late years the tendency is towards very low relief, as if in emulation with the style adopted in the new coinage. We must allow that with a soot-charged atmosphere there is a risk that figures which are much raised are likely to be darkened. Nevertheless, on the other hand, when the relief is low the character of the composition becomes obscured. There should be a proportion between the height of the ground and the relief of the figures. But sculptors can reasonably complain that they do not obtain sufficient encouragement to enable them to arrive at the required proportions.

ROBERT ADAM.*

IF architects in another world are allowed to display some of the excusable weaknesses which were familiar to them when on earth, they must often envy ROBERT ADAM. There was no originality about him, and everyone must be suspicious that his most insignificant ornamental form is derived from an ancient example. He was a counterpart of WEDGWOOD, and both were disposed to consider "Elegant extracts" as preferable to the designs of eighteenth-century artists. ADAM has not merely obtained the reputation of being the creator of a fine style—indeed, his name is to be met with every day in the catalogues of furniture-makers, as well as those of auctioneers—he has also been able to gain an enthusiastic eulogist, we might almost say an idolater, in Mr. PERCY FITZGERALD. Devotion of that kind is unique, for whenever litterateurs condescend to write about architects they usually furnish themselves with a critical scale and other apparatus for testing, in order to demonstrate by what a simple process success was attained. ROBERT ADAM is to Mr. FITZGERALD a brilliant Scot, a most engaging person, a very great artist, a most accomplished man, a pleasant man, an English BENVENUTO CELLINI, a decorator of the most elegant and fanciful order, a worker in metals, the author of a style, a remarkable personage, an Admirable CRICHTON, a man of romantic ideas, &c. We do not object to the phrases; there is, as Mr. FITZGERALD says, "something almost marvellous in everything associated with ADAM," and as evidence of it the lectures might be cited. As we said before, there is nothing like Mr. FITZGERALD'S book in architectural literature. He takes delight in gazing at the houses designed by ADAM which still survive. A walk down Portland Place and up again is, as he remarks, at once suggestive and entertaining. It is astonishing to note the varieties while all seem of the same pattern. A man is to be envied who can find so much enjoyment in that way and on whom even room doors have exercised a refining influence. The world has so few simple pleasures, Mr. FITZGERALD is rendering a service to the public in leading them to see how he can be pleased with things which should be no less influential with them. He claims the credit for having discovered ADAM. "A mere layman in these matters," he says, "I have had to work unassisted; for we look in vain, after a hundred and odd years, for any commentaries or exposition of his theories and work. I have brought a good deal of industry to my very pleasing task, and I really think have evolved a nearly complete system, which will give a very fair idea of what was the architect's mind when he was planning and carrying out his designs." It might be supposed that in an age when subjects were eagerly sought for criticism the neglect of ADAM must have had a motive. But that is a subject with which we have no concern. It will perhaps be more interesting to ascertain what were the reasons which induced Mr. FITZGERALD to take up a subject which others had neglected or abandoned.

In the first place, Mr. FITZGERALD felt the fascination of buildings. CHARLES LAMB preferred London to WORDSWORTH'S country, and for Mr. FITZGERALD mountains and lakes have not the attraction of a small ancient town. Renaissance buildings especially afforded him a particular delight. Then he admired WALTER SCOTT, and he concludes that ROBERT ADAM resembled the Wizard of the North not merely in features, but in power of work and other virtues. Little is known about the life of ADAM, but a clever novelist can make out a biography from a very few hints. Indeed, we imagine that Mr. FITZGERALD considers ADAM to have resembled a great many artists, and that what is related of them may have belonged also to him. Few, for

instance, would have observed a relationship between ADAM and the late JOHN SEDDING, but in the book we find it established in the following way:—

Casting about for a word or words that would exactly describe Adam's peculiar methods—a difficult thing to find—it seemed to me that to call him a pictorial architect and his system pictorial architecture would answer very well and correspond to the various gifts displayed by our architect. For he laid out his façades very much as a painter would his picture, with a view to attract, to excite interest and curiosity. Colour, shadow, relief, contrast, graceful forms and outlines—these he set forth on his "fronts"; he made everything speak or say something. Such pictorial artists are always interesting; their works excite and pique. "Wood of Bath" was pictorial in this sense, so was the late Mr. Sedding, and a few more. They contrast strongly with the slow-moving, strictly regular, and the rather uninteresting professors of the regular school, who do all by square and line. This Sedding had a wonderful likeness to Adam. He had an attractive personality and something of Adam's versatility, as we can see from that interesting if somewhat theatrical church of his in Sloane Street. Like Adam, he loved to expend himself in designing everything for his work, such as the lights, door-handles, railings, &c. Adam's nature was permeated with this pictorial feeling; he found nothing that was responsive or suggestive in the established models that surrounded him at home. The "pillar and portico style," as it might be called, had no flexibility, for it had its stiff rules. He could not exercise his fancy on such materials. Full of enterprise and originality, he resolved to go forth as an architectural pilgrim and seek for what he wanted. And this exploring was not to be in conventional pastures, but he set himself to discover what would be new and at the same time practical. There was a stroke of genius in this motive.

A paragraph of the foregoing kind suggests the weakness of words. If Mr. FITZGERALD were describing one of the great Italian architects or the designer of the palace at Spalato, he could hardly be more effusive. That building served many purposes for ADAM, and Mr. FITZGERALD says:—"I heartily wish, if I might say so, that this fashion of an architect attaching himself to a single building like St. Mark's or San Sophia or some town, was more in fashion, that he let it colour and direct all he did, just as ROMNEY gained by perpetually painting Lady HAMILTON." It is satisfactory to find that a good building is supposed to be inexhaustible, like a work of nature.

The grand principle of the ADAM system is assumed to be what he described as movement, a word for which we suppose contrast would now be substituted. According to ADAM:—"Movement is meant to express the rise and fall, the advance and recess, with other diversity of form in the different parts of a building, so as to add greatly to the picturesqueness of the composition. For the rising and falling, advancing and receding, with the convexity and concavity and other forms of the great parts have the same effect in architecture that hill and dale, foreground and distance, swelling and sinking, have in a landscape." Mr. FITZGERALD shows how ADAM realised movement in his buildings. He is described as having a sort of passion for the oval, which we suppose means that in his travels he had realised that the Greeks were not satisfied with the circle, but preferred more subtle forms. But he sometimes carried it to excess, as in his oval balconies. Mr. FITZGERALD does not, we fear, realise the importance which curves have in many architectural forms. He talks in a sarcastic way about "a Mr. PEARSON, a great Athenian in architecture," who has discovered further mysteries which, according to Mr. FITZGERALD, one might think "either that these things were owing to accident, decay, settlement, or the deceptions of scene-painting would become thus ennobled into art." We could understand an ignorant and presumptuous man like that glorified bricklayer, the late Sir ROBERT RAWLINSON, K.C.B., when he expressed a similar opinion, but Mr. FITZGERALD is a scholar and a man of taste, and should remember the Greeks were logical even in their masonry.

* *Robert Adam, Artist and Architect: His Works and His System.* The Substance of Lectures delivered at the Society of Arts, the Society of Architects, and various provincial architectural societies by Percy Fitzgerald, M.A., F.S.A. With Illustrations. (London: T. Fisher Unwin.)

There is a long description of the Adelphi; for ADAM was never oblivious of financial possibilities when he was building, and in dealing with that part of London he was speculative builder as well as architect. His houses in London and in the country are also dealt with. Mr. FITZGERALD, in addition, treats of the decoration. He cannot realise that everybody is unable to look on the arrangements of the ornament with as much pleasure as himself. One of the Earls of DERBY demolished a house in Grosvenor Square which ADAM had built or altered, and his lordship's action is described as an incredible want of taste. The *motifs* for the ornament are not very numerous, and owners were therefore to be excused if they occasionally tired of the antique patterns which were suggestive of a different world. Mr. FITZGERALD is so happily constituted that the most insignificant work of ADAM appears to be beautiful in his eyes. He keeps up his enthusiasm until the end of his book, and we can read every line he writes with pleasure, although we may not be convinced of the greatness of ROBERT ADAM.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening at 9 Conduit Street, W., Mr. John Belcher, A.R.A., president, in the chair.

Sculpture in its Relation to Architecture.

Mr. T. STIRLING LEE, in his lecture, asked what was that craving whereby both architects and sculptors sought to express themselves in figurative language. In the earliest times almost man had desired to express his thought in form, and the work on his tombs or temples bore testimony of this, and showed that he had taken sculpture to speak of his enlightenment as a language could. It would be seen, too, that the great ideals of the whole world had been written in the same manner, for without sculpture on the buildings how much would the succeeding generations have lost of the thoughts and lives of the Egyptians, Greeks, Romans and Florentines. There were the Mediævalists also, because if taken all the way through they would find that the buildings would have lacked expression had not the sculptors of those days been associated with the architects. It seemed to him that in sculpture men were writing the history of their times in the most open of all books—that of architecture. It stood in the streets for all to see, and the sculptors wrote their 'peoples' history in figurative language. No sculptor, therefore, who had to do serious work with architecture could approach his art except from that point of view, and believing that it was the highest sphere in which he could display his skill and knowledge. It was in that sense that, the lecturer said, he felt that every sculptor must be a very deep thinker and that he should always have been. For such work a man must observe nature very closely, because he had to use as his language those characteristics which he found in nature, and his observations therefrom had to appear in his sculpture. It seemed, therefore, doubtful, treating modern work from this aspect, whether we as a nation understood the figurative language. Did they, when sculpture was put up on our public buildings, grasp the fact that they were putting on a language that was going to be read and understood by the public? Was the symbolic language a living language to-day? The people no longer had an acquaintance with nature, and he was afraid that when sculptors worked out their observations from her source few people who saw their work would stop and read that which was written, and yet that was the use of sculpture in relation to architecture. One continued asking oneself, he said, if that longing to express whether our religious views, scientific discoveries, or whatever told of the attributes of good government on our public buildings of the liberal arts and sciences was real of the sculpture of to-day, and was it real of the public when it was set them to read in figurative language whence came the origin for such a mode of expression? In the old days they had not books, and people went about illustrating their thoughts and by seeing observations of nature the language of the sculptor was intelligible to them. But to-day they had to a great extent lost that touch with nature, and with it had gone the use of symbols on their buildings. On the æsthetic side, however, they had a language which must always exist as long as architects would continue to use and

design ornament as part of their building scheme. This was the highest form of ornament and masonry, because from the first principles of sculpture in relation to architecture the sculptor must realise that his carving was masonry. In a scheme for the use of sculpture on a building the first thought of the architect was to work out the sculptured parts. No doubt there would be a great desire to use that highest form of decoration, the human figure, and if that was so, what were the first principles in which the sculptor would treat the scheme? He must solve its deepest thought, its *raison d'être*, and translate this on his work. He must appreciate the idea of that part of the building which he had to decorate, what lines he had to carry through and the proportion of line, width and scale. The lecturer then demonstrated with the aid of photographs the wonderful genius of the Greek sculptors in the treatment of light and shade, continuity of line and their mastery of the laws of optics. They found from such examples that the Greeks cut up their sculpture in the proportions of panels and designed the ornament accordingly. Giotto and his contemporaries overcame the same problems in the same manner as the Greeks, and made all the lines of their sculpture harmonise with the architectural lines of their buildings. In dealing with the sculpture of the carver and the work of the modeller, Mr. Lee held that modelling was nothing less than the stone-rendering of a clay figure, and since the work was governed by anatomy rather than by geometry, it could not be so happy in its relation to architecture as the stone-cutting of the carver. Turning to the practical side the lecturer said it was a very serious difficulty in England to meet with good carvers, and the few men they had were doing less and less of their own work. There could be no doubt that sculpture offered as much individuality of expression as any other art. In conclusion, the lecturer said sculptors and architects should work together, and the sculptor must go to his art with the one idea of enriching the architecture.

Mr. W. REYNOLDS STEPHENS, contributing a short paper on the Relation of Sculpture to Architecture, said the subject naturally fell under two heads. First, constructional sculpture, or that which was formed out of a piece of the structural material of the building, and which actual piece had to perform its original office as weight-bearer or receiver of a thrust, such as columns, caps of columns, keystones, corbels, brackets and the like. Secondly, applied or superficial sculpture, under which heading he placed niche figures, the filling-in spaces, such as spandrels, panels and friezes; also mere surface work upon walls and other structural features. In both classes fitness for its purpose should be the greatest quality in the sculpture, and under that quality of fitness beauty stood supreme. The proportion, too, of certain lines in the building should guide the sculptor in his work, and their treatment should be expressive of our own times. In constructional sculpture an absolutely essential requirement was that it not only aided but appealed to the eye and brain as aiding the building material of which it was formed to do its work, whether its duty was support or resistance. The author drew attention to some faults of the past which should be avoided in modern work—for instance, where the pose or placing of the figures showed no appreciation of the laws of gravity. In many examples of architectural sculpture they could see figure after figure acting as bracket, corbel and the like, reaching out and pretending to carry a mass of material when in reality the material really carried them. Nowadays the average standard of the sculpture applied to buildings was not up to the quality of the architecture. There were some brilliant exceptions, the author admitted, but generally it was so, and he felt the reason was that sculptors wanted to be treated with more confidence and less as machines. The money paid was usually insufficient to provide thoughtful work, yet the total amount spent upon sculpture and ornament on many buildings was ample to provide the buildings with a few parts thoroughly well decorated with good quality sculpture, bestowing as great a gain to the building as to the sculptor. From some architects sculptors received all sympathy in their work, but not from the majority. Let architects go, said the author, to individual sculptors, first setting down as lightly as they liked conditions which it was just and right that architects should impose, explaining fully the site for the work and the surrounding materials, stating the approximate scale of figures or ornament, stating also any direction of line they wished emphasised—the flatness or height of projections. Let the architect give the subject he wished illustrated. Let him emphasise that he required a true recogni-

of use of material and provision against weather the work was to be outside, and the like. Let him be somewhat as to the money available, and then let the sculptor make a small design model for the architect to see, and after that give the sculptor a free hand and the honour and credit to be the designer of the work. The result would be that architects got the very best out of the sculptor, instead of, as in the present day, most sculptors looking upon their architectural sculpture as potboilers, and keeping their best intellectual qualities for their other work. With architects rested the responsibility of making the modern school of British architectural sculpture. Architects might not, and probably would not, get from the sculptor just what they had pictured in their minds, but with such an understanding as he had suggested they would get living work with individual character.

Sir JOHN TAYLOR, K.C.B., in proposing a vote of thanks to the two lecturers, said he was sure all architects would agree with every word which had been said on behalf of sculpture. The subject of the co-operation of the architect and the sculptor had been brought before the Institute on several occasions during the last two or three years, but he thought they had never had the value of it put more strongly before them than by the views expressed that evening. The architect and the sculptor should co-operate in the preparation of the design. It was no use whatever to have an architectural design prepared and then afterwards do the best to fill in the parts of it which required sculpture. They saw a few of many absurdities even in completed work in this respect; in some instances where the niches were all made for the figures, and, for want of co-operation between the sculptor and the architect, when the figures came to be placed in position they were not only inches but feet too large for the niches made to hold them.

Professor BERESFORD PITE seconded the vote of thanks, and said the lecturers had spoken earnestly of what they thought and recognised as an important subject. It was important to sculptors, and without any doubt it was important to architects. The latter perhaps were not so seriously convinced of the need for co-operation with the sculptors as they might be, and he was sure that sculptors were not convinced either. Did the architect ever trouble about a planing in the sculptor's work? Did not he regard it rather in the light that he wanted so much ornament, and therefore he used so much sculpture?

Mr. H. STANNUS said sculpture might be applied to building for two ends: first—and it was the reason of its existence—to tell its story; and secondly, to make fine building. With regard to the use of supporting figures, he suggested that, as no human being would be put in such positions as those sometimes devoted to sculpture, the designer should not adhere strictly to the lines of the human figure in his work. He might brutalise the figures by making the head more square than the ordinary human head.

The PRESIDENT said he felt bound to say that the sister arts, architecture and sculpture, had drifted apart, and it seemed as if the architects were to blame in the matter. He hoped, however, it was a division to be spoken of in the past tense, and that the future would find the architect and the sculptor knowing each other better, enabling the two arts to work closer together. The architect should prevent sculpture being used for ignominious purposes, because any one would agree that the sculptor had naturally drifted away from co-operation when his work with the architect lost its full purpose. As architects were beginning to learn the uses and advantages of sculpture on their buildings, so he hoped the sculptor would begin to learn that his own work could be a great aid to the fulfilment of the ideals of both arts.

OIL-PAINTINGS AND PASTELS.

IN the *Scientific American* is an extract translated from Herr Ostwald's book on "The Theory and Practice of Painting," which is deserving of the attention of artists. The author is a painter as well as a chemist. He says:—

Little improvement has been made in the technique of oil-painting since Pettenkofer, forty years ago, explained its scientific principles and exposed the antiquated character of current knowledge and practice. The temperature and humidity of picture galleries is now regulated in accordance with Pettenkofer's recommendations, and his method of renovating paintings has been adopted and developed, but the important question how to produce durable paintings is still neglected even by the best technicians, as is shown by the proportion of obviously short-lived works in every

collection. What is still more remarkable, picture buyers, both governmental and private, pay no attention to the expectation of life of their dearly-bought treasures. I know a very costly Makart which, though little more than twenty years old, is already a senile wreck. Its brilliant colours have become muddy, all detail is gone from the shadows, and the whole picture is flaked, cracked and wrinkled. A celebrated Knaus in the Leipzig Museum has become so covered with cracks that it has been taken down, and some of Menzel's early works are in little better condition.

So our art treasures are perishing before our eyes. Has the same condition always existed, and must it continue to exist? Neither the one nor the other. When we look at the splendid Van Eycks in the Berlin Museum, which have retained their brilliant hues almost unchanged for nearly five centuries, we infer that the swift decay of modern works is not an organic necessity. It may be objected that the method by which these durable old paintings were produced is irretrievably lost. True; but it is surely as possible to make permanent pictures now as it was then.

The first requisite is a certain amount of scientific research, the second and more important is that artists and purchasers should pay the same conscientious regard to permanence that was paid in Albrecht Dürer's time.

We require of the architect, as a matter of course, that his artistic creations shall not crumble in a few years, but the genius of the painter, it is assumed, must not be fettered by chemical laws or petty technical considerations. Yet so great an artist as Boecklin devoted his life to technical experiments, and he might have carried them further and given freer scope to his genius if he had also known a little chemistry. For example, he used pure vermilion with startling and unpleasant effect, because he fancied that vermilion is permanent when used alone, but is affected by other pigments. The truth is that some varieties of vermilion withstand the action of light very well, while others turn gray or brown, whether used alone or with other colours. If one speaks to a painter of these things he retorts that chemistry is the root of the whole evil; the Van Eycks knew nothing of it, and made durable pictures, but the modern aniline colours fade. This is unjust, for nineteenth-century artists painted fugitive pictures before aniline colours came into use. The fault is not in the colours but in the medium. Now, as formerly, the palette of the oil-painter consists chiefly of pigments of unquestioned permanence. All the yellow and red ochres, most blacks and browns, ultramarine, cadmium yellow, chrome green and some other colours remain unchanged for thousands of years; indigo, madder and Prussian blue endure for centuries. The former are the pigments of thirteenth-century and fourteenth-century frescoes; the latter are found well preserved in still older miniatures.

But these are not oil-paintings. The medium is carbonate of lime in the frescoes, gelatine or albumen in the miniatures. Nor are the Van Eycks above mentioned oil-paintings in the modern sense. The method employed in their production is not recorded, but it could be ascertained by micro-chemical examination. Many technical questions might be solved by such examination of minute fragments, which could be taken from the edges of pictures without material injury.

Still, some genuine oil-paintings are very permanent; for example, Raphael's "Sistine Madonna" in the Dresden gallery. Now a comparative study of old oil-paintings shows that those which are best preserved are very thinly painted. This is not a mere coincidence. The evils of oil increase with the thickness of the layer of paint, and are further intensified by applying one colour over another. Hence the works of Rubens, painted thinly and rapidly, are so much better preserved than Rembrandt's; and, for the same reason, Knaus's pictures, painted apparently on an asphaltum ground, have decayed so soon. In short, though it is possible to make permanent oil-paintings, conditions fatal to permanence are very apt to occur. One such condition is the use of thick masses of colour or impasting.

In spite of these obvious disadvantages, oil has practically displaced all other media, because it permits the artist to judge the effect of his work at once, as oil colours do not change appreciably in drying. Water colours alter perceptibly, and gouache still more, and the painter must make allowance for the alteration. But though the oil-painting does not change in drying, or in weeks or months, it changes inevitably in decades and centuries, and always in the same way, by assuming a general yellowish brown cast, called the "gallery tone."

Is there no remedy? I know none for the yellowing of oil with age, but we may take a broader view and seek a method, which shall retain the chief advantage of oil-painting and yet avoid its defects. Such a method is pastel.

Pastels show no trace of "gallery tone," but remain bright and fresh for centuries. They are executed with dry coloured crayons, which adhere loosely to the ground, and must therefore be protected with glass. Pastel allows the greatest freedom of treatment, and unsatisfactory parts can be wiped off and done over as often as necessary. When I recommend this method to painters, they say: "Very true. If one could only fix the pastel." Even this is possible. In my "Notes on Painting" I have given the formula of a fixative which enables a pastel picture to be rolled, dusted and cleaned with bread crumbs without injury. This brings us back to a medium, but one which is used in very small quantity and does not darken with age, but at the worst only disappears, when it may be reapplied. When I add that pastel is suitable for pictures of every size and character, that it is the cheapest of all methods, and that it enables the artist once more to prepare his own colours and assure himself of their purity, it will be understood why I regard it as the method of the future.

MANCHESTER SOCIETY OF ARCHITECTS.

ON May 2 this Society began its summer programme of visits, about thirty members going to the church of the Christian Scientists, Victoria Park, Mr. Edgar Wood, architect. The entrance forecourt shows picturesque grouping of simple and unusual character, and the interior, when completed to double its present length, will be very satisfactory, the whole showing considerable individuality and suitability to its purpose. Afterwards the members visited St. Chrysostom's Church to study the effects of the recent fire, finding very complete proofs of the unreliability of stone when exposed to heat and water.

On Saturday, May 6, a visit was made to Leeds to see the new Roman Catholic cathedral, Mr. J. H. Eastwood, architect. A considerable time was spent, under the guidance of the clerk of works, in thoroughly examining the building, and much of interest was found, both in detail and in general design. The party then divided and utilised the little remaining time in making flying visits to Kirkstall Abbey or to Mr. Bodley's fine church at Allerton.

TESSERÆ.

The Skull as a Model.

THE human skull is composed of five great bones united and consolidated by interlacing processes, termed sutures. Here we have at once a perfect dome, and also a solution of that difficult problem how best to render firm this mode of architectural construction. The dome of St. Sophia, in Constantinople fell three times during its erection, and that of the cathedral at Florence stood unfinished 120 years for want of an architect. In St. Paul's, London, the dome is linked together with strong iron chains. So also St. Peter's at Rome and St. Isaac's, St. Petersburg. In Byzantine architecture the necessary support is given by increasing the thickness of the coping at the base of the dome. This is rendered necessary by the heat of southern climates, which by expanding the iron cramps would soon destroy any dome so girded together. Still, of course, the system of dovetailing or suture is the best, and, indeed, so strong is this union that when everything, muscle, ligament and membrane, has been removed, the sutures of the cranium still hold till separated by a strong internal pressure acting upon every part of the junction at once. The great obstacle to be encountered in the formation of a roof is the lateral thrust of the rafters. Now this may be got over in various ways. In an angular waggon-headed roof it may be done by supporting the mitrings. And this is exactly what we find in the thickened centres of the parietal and frontal bones. For to explain this physiological fact by simply saying that the centres of these bones are the points from which ossification begins is to assert a principle which, pushed to the legitimate extent, would do away with all evidence of design whatever in the structure of the human frame. What are called open roofs are usually supported either by tie beams or braces. Now to have bones analogous to the latter construction, running through the brain would

be extremely inconvenient, and accordingly we find a beam employed as represented by the temporal, more by the spheroid bones. The inner table of the skull is termed the tabula vitrea. With our brittle materials we are unable to dovetail, so in this glassy formation we have no suture but a plain contact.

Henry Fuseli, R.A.

Henry Fuseli, or Füssly, was born at Zurich in 1754, in consequence of a dispute which he had with the Government. He then removed to Berlin, where he became acquainted with Sir Andrew Mitchell, the English Envoy at that Court. He had read one of Shakespeare's plays in a German translation, and was so much delighted with it that he determined to learn the English language, which he accomplished with facility and at length with correctness, both in speaking and writing. When Sir Mitchell left Berlin in 1765 Fuseli accompanied him to England, and as an evidence of his proficiency in the language he published in the same year a translation of Winckelmann's "Reflections on the Painting and Sculpture of the Greeks," and afterwards, in 1768, "Remarks on the Quarrel between Voltaire and Rousseau," in favour of the latter. Subsequently he visited Italy and finished his studies in painting, attaching himself to the world-famous Michel Angelo, for which he professed a devoted affection, but the artists he chiefly imitated were Spagnoletto and Goltzius. His "Lycidas" from Milton, his "The House," the "Nightmare," and "The Three Witches" are among the best examples of his genius. He was a man of high pretensions, and had respect for the opinions of others, which he treated with ridicule or satire. But a caustic and racy style of observation, combined with a peculiarity of pronunciation and of countenance, rendered him very entertaining in society. Those who have by nature a bluntness and incivil manner, and affect even more, suppose that they are earning a reputation for honesty and a fearless independence, although it often happens that men of this disposition trample on the weak and defenceless, are servile when they have any view of their own advantage, and are cocksure when their exaggerations are successfully opposed. These traits were remarkably characteristic of Fuseli. When Marchant (the gem-engraver) offered himself to be elected as Associate of the Royal Academy, Fuseli opposed him, insisting that the Academy might just as well elect a watchmaker; but when he found that Marchant could render him service among the patrons of art he became the subject of eulogy, and loudly declared that his *intagli* were worthy of Michael Angelo. At one of Johnson's (the bookseller's) hebdomadal dinners he met Horne Tooke, and as he spoke most disrespectfully of one of Horne's friends, having been forced to acknowledge that he had neither known nor valued him, he sheltered himself under an abject apology. Fuseli amused himself with playful satire on the works of more eminent contemporaries. West's picture of "The Jews fighting for the Bones of Japheth" he called "The Jews fighting for the Bones of La Hogue." What he said of Northcote's "Balaam" is sufficiently known, and Peter Paul's retort that Fuseli was just appointed by the Devil to be the painter of hobgoblins has been ten times told. He made a singular observation concerning the characteristics of Northcote, Opie and himself as artists with respect to design. "If you would have a picture of nature as she is, you must go to Opie; if one as she has been, go to Northcote; but if you wish to possess representations which never have been, nor ever will be, come to me." His constant friend Johnson, the bookseller, left him a legacy of 50*l.* a year for the lives of himself and his wife, which was sold for 630*l.* His drawings, which amounted to a number of 804, after his death were sold by Mrs. Fuseli to Sir T. Lawrence, who gave her a bond bearing interest of 200*l.* a year, outstanding at the time of his decease. This bond was cancelled upon the drawings having been turned by his executor. They were sold for the same sum to the Countess Dowager of Guildford.

The Antecedents of Gothic.

The Romans were making rapid strides in the art of vaulting when the removal of the seat of empire to Constantinople, and with it of the best artists of all classes, appears to have also transplanted this growing art to the soil of the East. The latest vaulted hall in Rome is the so-called Temple of Peace, now held by the Italian authorities to be a basilica erected by Constantine. In the East

ing on a large scale continued to be practised, and the improvement of suspending a dome over a square by means of pendentives, of which S. Sophia at Constantinople is the great specimen. This Byzantine style, so regularly derived from the Roman, was brought to the West, first to Ravenna by the exarchs, and afterwards by the Venetians in the eleventh century, as exemplified in St. Mark and other buildings of their district. In the meantime the great Christian churches erected at Constantinople, under the patronage of Constantine and his successors, show but too plainly the deplorable state of architecture in the West. They are, to be sure, large and lofty, and consist of parallel ranges of columns, of different orders, adapted without skill from the destroyed temples, sustaining upon arches walls of disproportionate height, covered with open wooden roofs, the whole bearing the mark of ignorance and neglect of rules. In the distant remote from Rome another process of architectural change was going on. Here the ravages of the barbarians swept away the ancient rules altogether, and left only a few tattered examples, and here we find that after they had led themselves in their conquests their builders, working unschooled imitators, copied the construction of these and employed their materials, using the fragments of sculpture, but naturally placing them so as to be entirely servient to the actual construction of the building. Here new ornaments were required they imitated the old or invented others. In this way were formed the various styles of the ages preceding the eleventh century, the German and French Romanesques, the Lombard, Saxon, Norman, Saracen and others, all of which have features deriving entirely from those by which the Byzantine and Christian Roman are separated from their common origin, but all exhibit more or less of a barbarous and rude character. They constitute, however, so many different and independent sources from which may be traced the formation of the Gothic, some supplying one feature and some other, while others, after enduring transitions, were finally superseded by the introduction of some descendant of the first.

Ancient Lighthouses.

The most celebrated lighthouse of antiquity was that situated at the entrance to the port of Alexandria. It was built by Sostratus of Cnidos on an island which bore the same name by command of one of the Ptolemies, and at an expense of 800 talents. It was square, constructed of white marble and with admirable art, exceedingly lofty, and in all respects of great dimensions. It contained many storeys, which diminished in width from below upwards. The upper storeys had windows looking seawards, and torches or fires were kept burning in them by night in order to guide vessels into the harbour. Pliny mentions the lighthouses of Ostia and Ravenna, and says that there were similar towers at many other places. They are represented on the medals of Apamea and other maritime cities. The name of Pharos was given to them in allusion to that at Alexandria, which was the model for their construction. The Pharos of Brundisium, for example, was, like that of Alexandria, an island with a lighthouse upon it. Seutonius mentions another pharos at Caprea. Two pharos remain in Britain. The first is within the precincts of Dover Castle, is about 40 feet high, octagonal externally, tapering from below upwards, and built with narrow courses of brick and much wider courses of stone in alternate portions. The space within the tower is square, the sides of the octagon without and of the square within being equal, viz. each 10 Roman feet. The door is seen at the bottom. A similar pharos formerly existed at Boulogne, and is supposed to have been built by Caligula. A round tower had served as a lighthouse on the summit of a hill on the coast of Wiltshire.

Antique Gems.

There is, perhaps, no more remarkable chapter in the history of the arts than that of gem engraving amongst the ancients. It is the one pre-eminent art in which the ancient Greek and Roman masters never have been and probably never will be surpassed. From the imperishable nature of the vehicles of embodiment, many even of the masterpieces of antiquity have come down to us in their pristine perfection; whilst such was the astonishing number of engraved gems, executed during a long series of ages, and such is their comparatively indestructible nature, fire or the sea alone withdrawing them from our actual or possible possession with absolute finality, that it is more than probable the modern world now possesses specimens

of every style, technique and material, at any time adopted by the ancients; in short, for the study of this art there exist the amplest materials, and this can scarcely be said of any other subject or concern of antiquity. Without speculating as to the precise period or country in which the glyptic art had its origin, there can be little doubt that it became popular in the very earliest ages of ancient civilisation; it was doubtless practised amongst the Greeks not less than five or six hundred years before the Christian era, and it is highly probable we have monuments in our possession of at least that antiquity. Nor can it be said that the modern world has been indifferent to the subject of ancient glyptic art, for the literature of this art is one of the most voluminous branches of written knowledge; in every great library no small space is accorded to the ponderous volumes in which the immense mass of glyptic erudition is embodied; indeed the subject has been rather overlaid and stifled with crude illustration than neglected. It would be a curious speculation to endeavour to estimate the probable number of antique gems, glass pastes, &c., now extant in collections or worn on the fingers of modern possessors; certainly it would amount to many hundreds of thousands, perhaps even millions, whilst there cannot be a doubt that a vastly greater number are still hidden beneath the surface of the soil. In reference to the latter thought, indeed, what can be more tantalising than the reflection that of the innumerable fragments of noble antique gems preserved in collections, the missing and often most precious portions are still quietly slumbering in the ground, washed from century to century by the rains of heaven, crusted with the tartarous salts of an ancient soil, imperishable, but never to be reunited to their kindred pieces. Here it is, indeed, that a potent divining rod might be exercised in a worthy cause.

Tudor and Elizabethan Mansions.

The principal deviation from the plan of the earlier houses, in the time of the Tudors, was in the bay windows, parapets, porticoes; and internally, in the halls, galleries, chambers of state and staircases. The two last-mentioned were rendered as rich in ornamental carving as the grotesque taste then prevalent could invent or apply; the ceilings were fretted with roses and armorial devices, but without pendants, as in the earlier style. The fronts of the porticoes were overlaid with carved entablatures, figures and armorial devices; the lofty and wide galleries generally exceeded 100 feet in length, and the staircases were so spacious as to occupy a considerable part of the centre of the house. The imperfectly imitated Roman style introduced by John of Padua, in its first dawn in this kingdom, began now to extend its influence, although partially. At Burleigh, the parapets which surround the whole structure are composed of open work, describing a variety of Tuscan scrolls; and the chimneys are Tuscan columns, two, three or four, clustered together and surmounted by a frieze and entablature. Open parapets, having letters placed between them, as a conceit indicative of the founder, were then first introduced. The large manor-houses, dispersed throughout the several English counties, constructed of timber frame-work, were very general where a supply of stone or brick failed; the carved pendants and the weather-boards of the gables and roof were carved in oak or chestnut, with exuberance of fancy and good execution. The counties of Chester, Salop and Stafford abounded more especially in curious instances, many of which are no longer seen and their memory preserved only in old engravings. The zenith of this particular fashion of domestic architecture was the reign of Elizabeth, and it is thus discriminated by a contemporary observer:—"Of the curiosnesse of these piles I speak not, sith our workmen are grown generallie to such an excellencie of device in the frames now made that they farre pass the finest of the olde. It is a worlde to see how divers men being bent to buildinge, and having a delectable veine in spending of their goodes by that trade, doo daileie imagine new devises of their owne to guide their workmen withall, and those more curious and excellent than the former."—Harrison's "Desc. of England," p. 336. In the more ancient cities and towns houses of timber frame, but in a peculiar and not less ornamented style of carvings, were frequent; and in the fronts towards the street and in the wainscoting of the apartments the supporting figures were of extremely whimsical forms. It is not easy to determine what they were intended to represent. Those which have remained to our own times might have been seen at Chester, Shrewsbury, Coventry and Bristol; but in the last-mentioned place most have vanished in the course of the eighteenth century, and their representations are preserved only in the portfolios of local antiquaries.

NOTES AND COMMENTS.

GLASGOW has the enviable privilege of possessing a school of art with distinct characteristics. Not many years ago the city would not be considered as a likely place for the cultivation of genuine artists. But having appeared, they have exercised that influence which at one time was common in Italian cities. Encouragement is given by the purchase of pictures, but it is now evident that the power of art is recognised among people who may never aspire to the possession of an original work of the smallest kind. An application was lately made to the Corporation to allow the art galleries to be opened on Sundays. BAILIE NICOL JARVIE respected the Sabbath so much, it was a crime for anyone to enter the Tolbooth in the evening, and, indeed, he thought it was a sin to have given way to his own thoughts on that day. There was therefore excuse if the Corporation were afraid to deal with so momentous a subject. It was accordingly resolved to have a plébiscite. One hundred and forty-one thousand six hundred and forty-two papers were distributed, 7,030 were undelivered, and of those which were returned, 4,733 were doubtful. Of those which were valid, it was found that 53,389 were in favour of the opening of the galleries and 45,181 represented the old, serious way of dealing with the subject. There is consequently a majority on one side of over 8,000. That would be a decisive victory in any ordinary town, but in Glasgow it is a revelation of a remarkable change in public opinion.

MOTOR traffic is assumed to be the principal cause of that deterioration of roads which causes anxiety to every county council in the kingdom. Various remedies have been proposed, and we believe the patent list is likely to contain records of specifics, all of which are supposed to be infallible. In Leith experiments have been undertaken under conditions which are creditable to the Town Council. The attempts were recommended by one member, and they were sanctioned on the condition that in case of failure he would repay the whole of the expenses. There is, however, no mystery about the proposed treatment, for it is simply adopted from the practice followed in some parts of France. The surface of the road is brought to the proper section. It is then well swept with a hard broom, the superfluous matter being preserved. The surface is then sprayed with tar, and the sweepings are carefully spread over the tar. The road is then rolled, and after five or six hours, when the tar hardens, it can be used for traffic. Although tar is more expensive in France than in England, it is considered that the use of it in the way described is economical. In some places the roads have remained in good order for a twelvemonth. The arrangement is a combination of tar pavement with a solid foundation.

THE housing problem ought to present more of a difficulty in France than in England. But it is lessened by the content of the humbler classes to put up with inconveniences which in England would be a constant source of irritation. Philanthropists have endeavoured to do much towards its solution, and there have been countless conferences on the subject with the usual accompaniment of speeches and reports. But the experiments in building have been insignificant. According to M. HENRI TUROT, one of the municipal councillors of Paris, there were only 1,503 cheap dwellings erected in the whole of France during the decade 1894-1904. Forty-four of them are to be found in the Department of the Seine, and only five in Paris. Considering all the eloquence which has been expended on the subject, that may seem incredible, but M. TUROT is an authority. A law was passed last year to facilitate enterprise in that form, but apparently the conditions are not sufficiently attractive. M. TUROT proposes that building sites for cheap dwellings should be free from taxes for twenty years, and he suggests that the funds which

are to be set aside for old-age pensions should be applied to habitations, and that loans should be obtained from public funds at a more moderate rate of interest is usually required. The recommendations appear to touch the real difficulty, which is that of finance. English capitalists would prefer to deal with a man like M. TUROT rather than with a tribe of philanthropists.

THE Berks Archæological Society will henceforth be suitably lodged in Reading, for a new lease of the Abbey Gate has been obtained from the Corporation, but at an increased rent. Power has, however, been granted to let the large chamber for meetings at a suitable charge for its use. It is hoped that the funds of the Society will not be unduly strained by the increased rental which the Corporation had required. The principal chamber of the Gateway affords a very convenient meeting-place, and the committee desire that extensive use may be made of that ancient building. The annual report of the Society expressed the hope that the Corporation of Reading, into whose hands the old Hospitium of the Abbey has reverted, will do their utmost to preserve the ancient building, and not countenance any destructive vandalism for the sake of modern utility.

A MEETING of local Associates of the Royal Institute of British Architects was held in Leeds this week, and the following resolutions were passed:—(1) That a meeting of Associates views with much indignation the present large influx of members to the Royal Institute by direct election to the Fellowship, and in view of the facts (a) that many of the candidates are of suitable age to qualify for membership by the "special" examination provided for such cases; (b) that some of them have not been successful in the examinations, but are nevertheless supported by prominent members of the R.I.B.A. Council, we protest against this as a lowering of the standard required for membership; as a most unfortunate blow to the cause of professional education they profess to encourage; and as a gross injustice to those who have qualified by examination for membership at much expenditure of time and money. (2) That we urge upon the Associates in London and in all the allied Societies to combine in opposing these numerous and unwarranted nominations by demanding a ballot as prescribed by-law 9, and by all the regular means. (3) That copies of the above resolutions be sent to the R.I.B.A. Council, to the allied Societies and to the leading professional journals. The following Associates were present: W. G. SMITHSON, W. H. BEEVERS, H. ASCOTT, CHAPMAN, R. FIELDING FARRAR, ALBERT E. KILGOUR, HERBERT E. ILLINGWORTH, F. E. P. EDWARDS, RYSHWORTH HILL, CHARLES B. HOWDILL, JOSEPH WOOD, FREDK. MUSTO, EDWARD L. GAUNT.

ILLUSTRATIONS.

ST. DAVID'S CHURCH, BATHGATE.

THIS building was used for service a fortnight since. The design is not yet carried out in entirety, but will be undertaken in due time. The architect is Mr. J. GRAHAM FAIRLEY, of Joppa, Edinburgh.

INDEMNITY HOUSE, OLD BROAD STREET, E.C.—ENTRANCE HALL FROM DOOR—ENTRANCE HALL TO DOOR.

SOUTHWARK POLICE COURT.—EXTERIOR.

STAIRCASE, COUNTY SESSIONS HOUSE, PRESTON.

MESSRS. ARCHIBALD D. DAWNAY & SONS, LTD. have carried out the constructional steelwork, of which there was a considerable amount, and the fireproof floors in the Reading Gas Company's new offices, of which we published an illustration last week.

STATUTORY QUALIFICATION OF ARCHITECTS.

THE following papers were read at the meeting of the Society of Architects on the 18th inst:—

By MR. G. HUBBARD, F.S.A.

As a London practising architect and as a Fellow of the Council of the R.I.B.A., I am very anxious to know more of the general feeling of the profession in respect to the statutory qualification of architects. It is not from idle curiosity that I wish to obtain this knowledge, but it is because I am anxious to make some practical use of it so that the Bill for the statutory qualification of architects may receive the unanimous support of the profession throughout the country. The Allied Societies of the Institute have considered and held up their minds on this question, while the London Society have remained apathetic. It is very much, if not almost entirely, thanks to the able and persistent energies of the representatives of the allied Societies on the Council, that London is at last rousing itself from its slumbers, and preparing to give serious consideration to what your Society seriously considered years ago. As you may be aware, the Council now has this important question seriously under consideration, and it has from its body elected a committee to report upon the principle of registration.

In a broad sense it is easy to see that a Bill for the provision of qualified architects is very desirable, but it is not so easy to see how a Bill can be framed which shall be constitutional in its clauses. It is obvious that no Bill would be acceptable to Parliament which was unconstitutional, would it be likely to get through its committee stages if due opposition was brought to bear against it. Certain compromises may have to be made in matters which are of minor importance, but in all matters essential there must be unity. The necessity of such a Bill must in time become apparent to all in London who have the interests of the profession at heart, and the cumulative knowledge which can be gained in discussion amongst practising architects will be of the greatest service to the committee which is now engaged in drafting the Bill. I therefore trust the views of your Society may be frankly expressed in discussion which is to follow. It is essential that this should be framed so as to embody the best and highest traditions and interests of the profession both in London and the provinces.

To you, gentlemen, and to me it must have become apparent that the profession is constantly being recruited by the untrained and incompetent. That both for the sake of architecture and the properly trained men it is essential steps should be taken to foster the one and protect the other. This can only be done by compelling those who wish to practise, to prove their qualification before being allowed to do so. Our guidance for the future can best be derived by studying the experience of the past. If we look a quarter of a century we find that there was no compulsory examination for the Associateship of the R.I.B.A.; there was, however, a voluntary examination for which few candidates ever presented themselves.

It was not till the year 1882 that the compulsory examination for Associateship was started, and the immediate result of converting the voluntary to the compulsory examination was that there was an immediate rise in the number of candidates. But ever since that compulsory examination was introduced in 1882 there can be no question as to the superiority of men who have joined the Institute or the superiority of their works. If one bears this fact in mind as a guide to the future we should feel encouraged to promote the whole profession a similar state of affairs by similar means as now obtains among the Associates of the Institute. A compulsory examination has there encouraged candidates to study the art they intend to practise with a great access of competence to themselves and of dignity to the art of architecture. What holds good for the few may be fairly assumed to apply equally well to the many—where all are aided the access of competence and dignity must be in like proportion. A general application of the principle of excluding the incompetent from our profession would result in protecting the competent and the art of architecture from the most flagrant debasers.

It must not be forgotten that an architect's work is a lasting monument which eloquently expresses not only the individual mind which conceived it, but it goes to show the general civilisation of the nation. Every ignobly conceived and executed building tends to lower the general instincts of beholders, whereas the refined work of the cultured architect is ennobling from generation to generation. In

fact, no truer evidence of the culture and civilisation of a nation is recorded than is to be seen in its buildings. Think of the everlasting nature of the Egyptian, the beauty of the Greek, the scientific construction of the Roman, and the rise, development and perfection of Gothic, and can anyone for a moment suppose that the designers of these buildings had no training? Were not they above all others qualified to practise the art of architecture?

This it may be thought is approaching the subject from a lofty point of view, but not more lofty than is fully justified when one compares the architecture of the past with the average architecture of our generation. It is, in fact, from a high and not low standard that the subject should be considered. Architecture is an expression of faith, of feeling and of purpose, but it is only the trained architect who knows how to make his art respond to his impressions. Let us consider how to place the noblest of professions in the high position which it ought to occupy, and to induce men of standing and education to join our ranks so that our profession may go down to our sons safe from the debasing influences of the ignorant and incompetent. Without statutory qualification it is impossible to carry out these high ideals.

For many years the profession has had before it a Bill promoted by your Society. This Bill is in my opinion excellent in its general scheme, but it is also in my opinion capable of improvement in detail. The Royal Institute of British Architects is, however, the right body to bring forward such a measure. The royal charter granted to that body constitutes it the head of the profession in the kingdom, and while recognising the important work which has been done by your Society, we must look to the Institute to protect the profession and bring forward the Bill for the statutory qualification of architects.

Without entering upon questions of detail which are now under consideration of the committee of Council of the Institute, I wish to indicate to you in general terms the broad lines on which the Bill is being drafted. It is not desired, nor is it desirable, to frame a Bill which should be complicated, as it is felt that if the broad principle of safeguarding the profession is established our main object would be attained.

It may be safely said that no Bill would be acceptable to the profession which did not recognise the R.I.B.A. as being the official head and which did not give each provincial Society and your own Society a reasonable representation upon the governing body. Also no Bill would be acceptable to Parliament which did not give the Privy Council representation and possibly right of final appeal.

It is essential that vested interests of all practising architects would have to be recognised. All who are now gaining their livelihood as practising architects have this vested interest, and it would be unconstitutional to prevent any, even the most incompetent, from continuing thus to earn his living. On this point there has been a considerable amount of diversity of opinion. It is felt by some that no benefit would be gained unless the Bill debar all who are unqualified from continuing to practise. It must, however, be recognised that as the ignorant and incompetent die, the vacancies will be gradually filled by the properly trained and qualified. It may not be in our generation, but in the generation to follow, that the art of architecture will gradually recover when it becomes entrusted only to the qualified to practise.

At first the fact that the names of the highest and the lowest in the profession would have to be entered side by side in the same register or roll is distasteful to some, but I must admit that I fail to see that they need be more affronted by this than they are to-day in having their names recorded together in Kelly's Directory, for instance. In any case, the foolish pride of the few should not be allowed to stand in the way of a great reform advantageous to the profession and to the country. It must be remembered that this annoyance to some will be gradually decreasing, and, as I have just shown, in the course of a generation it will have disappeared.

It was just thirty years that internal jealousies delayed the passing of the Medical Act, and it is now just fifty years since that Act was passed, and yet throughout the land it is doubtful if a single medical practitioner is to be found who has not passed the necessary medical qualification. Our grandfathers might tell us how different was the respect accorded to the barber surgeons of their day, as compared with the respect which is shown to the properly qualified medical men of to-day. Not only has the stamp of man entirely altered, but the immeasurable advance both in

medicine and surgery is unquestionable. It is doubtful whether anyone, either layman or doctor, would care to go back to the old order of things. And in our profession, after the Bill has once become law, is it likely that architects would give it up?

Surprising as it may seem, it is just twenty years since the first Bill for the registration of architects was drafted. Think for one moment how different would our position be to-day had the Bill been passed.

There is now practically unanimity amongst the provincial Societies. London is wavering, but even there the active opponents are few and unable to bring forward any valid arguments.

There are two reasons why London lags behind.

Firstly, just as it is easier to move a hundredweight than a ton, it is easier to convince a small compact community than it is to convince a great and loosely bound body of men. Secondly, in the provinces the necessity of registration is much more real and apparent than it is in London.

For the ultimate success of the movement it is essential that all future candidates for the profession should serve a certain period of indentures with a recognised practitioner, or in some recognised architectural college or school, and after that period they would have to pass the qualifying examination which would have to be conducted under the auspices of the R.I.B.A. None but those who would have properly fulfilled these conditions would be entitled to call themselves "Architects," nor would they be able to recover their fees as such in a court of law, nor would they be able to issue valid certificates. It must not be assumed from this that the Bill contemplates insisting upon every employer only engaging the services of the registered architect. An employer would be perfectly at liberty to engage the services of anyone he chose whether qualified or not, but what the Bill will insist upon is that the unregistered practitioner shall not be at liberty to call himself "Architect" and claim his fees as such in a court of law, nor would he be able to issue valid certificates.

It is necessary to remember that the actual number of practising architects does not perhaps represent more than half the total number of those who are engaged in gaining their living in the profession. The great number of architects' assistants and draughtsmen who have spent many years of their lives in that capacity have also some form of vested interest, and their claim to protection in the Bill must also be carefully considered. Their service of years will in all probability entitle them to have their names also recorded on the register or roll.

Another very important point to remember is that at the present time we have no means to deal with malpractices, however flagrant. The removal from the roll in other professions is a punishment of the greatest severity, and the right of inflicting it in our own profession would have to be in the hands of the governing body. With comparative impunity can the malefactor practise his dishonesty, and even detection and conviction does not deter him from continuing to practise as an architect. The fear, however, of being struck off the roll will doubtless in some instances act as a healthy corrective.

Such in fact is the general outline of the Bill now being considered by the sub-committee of the Council of the R.I.B.A. The demands for the protection of the public and the profession are eminently reasonable and moderate, and as there is so little of a contentious nature it may be, I think, safely assumed that the Bill will go through Parliament with but little opposition.

It may be anticipated that the chief opposition to making our profession a close one will arise from the underlying socialistic spirit which governs all modern legislation. I am not using the term "socialistic" in any political sense; all I intend implying is that modern legislation tends to give the community common rights rather than to give any particular section of the community special privileges.

Parliament, however, will not be unmindful of the fact that where a particular section of the public has made a considerable investment in acquiring the special knowledge of the art and practice of a profession, that it is entitled to have that investment protected. This protection is not only justified in the interests of those who have made it, but it is also justified and advisable in the interests of the community, who should be enabled to discriminate between the properly qualified man and the incompetent charlatans. At the present time both the qualified man and the charlatan can equally claim to be professors of the art, and the community without some internal knowledge as to their respective merits is unable to distinguish between them.

When one considers the large financial interests which the architect has often to advise, the necessity of Parliament affording the public some assistance in the selection of its advisers becomes the more apparent. Many matters outside our own profession the layman's statutory powers is often felt. An appeal at the present time from the R.I.B.A. to Parliament or to any governing board may perhaps carry some weight, but were it to speak as representing a homogeneous profession it would do so with infinitely greater effect.

That there has been a lack of esprit de corps amongst ourselves is not entirely to be wondered at. To say that a man is an architect is not a passport to guarantee cordial reception, and when we are all bonded together under an Act of Parliament, with the common interest that is the profession, we shall find that that bond will be of union and of friendship. It is undoubtedly in the provinces more than in the Metropolis that the necessity of statutory qualification is keenly felt.

In London the individual architect is but one amongst thousands; he has his own particular clientele, and perhaps spends his life without his existence ever coming known except to a very small section of the architectural world. His position would probably not be improved or damaged by statutory qualification, and does not therefore hold any decided opinion one way or the other. In the provinces the architect's position is different. He is known to all the other practising architects in the town or neighbourhood. The architect is generally well known to the inhabitants, and the position of the architect is more clearly defined. The standard of the provincial architect, or any architect of education, is distinctly damaged when perhaps an intelligent bricklayer, for instance, who has raised himself to the position of a master of works, and who, after having served some time in that capacity, suddenly aspires to calling himself an architect. He may not perhaps enjoy a vast amount of confidence, but he succeeds in securing a vast amount of work, but there remains that both men call themselves "architects," and such they become bracketed together in the eyes of the public. By allowing both men to be established on the same footing, the professional status of the educated architect is seriously damaged. That statutory qualification would do much to improve the status of the architect there can be no doubt.

The main points aimed at in the proposed Bill are as follows:—

1. The R.I.B.A. to be recognised head of the profession.
2. Adequate representation of London and provinces on the governing body.
3. Representatives of the Privy Council on the governing body.
4. The vested interests of present practising architects to be recognised.
5. The vested interests of assistants.
6. A register or roll of architects to be kept.
7. Compulsory examination for those in the future wishing to practise as architects.
8. The governing body to have the right of striking names off the roll or register for malpractice.
9. The safeguarding of the name "Architect" being used by any except those who are registered.

That a movement favourable to registration has thus far at the Royal Institute of British Architects is a happy circumstance, entirely due to the confident manner in which the electors last June returned to the Council candidates were pledged to support registration, and I trust that the Society and the Institute may work harmoniously together in support of a movement advantageous to all.

By ALFRED W. S. CROSS, M.A.

"The cause of the less successful members of our profession is the cause of reform, of equal justice, of education—must be a good one, and those who support it must be in the right."

The following brief notes on the proposed scheme for the registration, or as some of us prefer to call it, statutory qualification of architects, have been prepared for the view of eliciting, by an evening partially special informal discussion with the members of the Society of Architects, any suggestions that may be offered on the subject which are likely to prove of assistance to the committee of the Royal Institute of British Architects that is now dealing with this great question. But to enable us to be fully conversant with the aspirations of registrationists, as well to review, as briefly as possible, the present position.

our profession before indicating in general terms what is not by registration and what we believe will be ultimately effected by its adoption. I have therefore grouped my paper under the following heads, viz.

1. The present state of architecture and of the architectural profession.
2. The statutory qualification of architects.
3. The reformed profession.

The Present State of Architecture and of the Architectural Profession.

In making a cursory survey of current architecture, even with a full knowledge of the vexatious limitations and restrictions which fetter the architect of to-day, the honest man is compelled to arrive at the unwelcome conclusion that the best of our modern public buildings, or at least those designed in the now popular Italian Renaissance style, fall below the standard of excellence attained by such men as Jones, Wren, Gibbs, Chambers, the Brothers Adam and others of their school. Indeed, I doubt if we have as yet a single architect capable of producing monumental works which will not largely suffer by comparison with designs for buildings of a similar nature that have emanated from one or another of these great artists of the sixteenth and eighteenth centuries. If you admit the force of this proposition you will agree with me that the present position of our art or profession—call it which you please—is an eminently unsatisfactory one, and to me it seems evident that whilst the works of modern architects sometimes display a certain amount of creative power or originality, this attribute is very rarely found in combination with architectural scholarship, by which I mean an intelligent appreciation of the true principles which form the foundation of the style we are discussing and are exemplified in the glorious buildings of ancient Greece and Rome.

Within the last twenty years we have seen so many imitations of architectural style and taste that it has been almost impossible for an architect who has, wisely or unwisely, followed the fashions to absolutely master any one of them. I can recollect the able Gothic designs for public buildings (imitated *ad nauseam* by many admirers) of Mr. E. W. Godwin and Mr. W. Burges; drawings galore in the so-called Queen Anne style, an ephemeral revival of a phase of art for which Mr. Norman Shaw was largely responsible; and, still more recently, many of our leading architects were working in the hybrid Jacobean style, which in course of reality no style at all, but simply an intermediate stage between the domestic Gothic of the Tudor period and the real Italian Renaissance of Inigo Jones.

At the present time a few architects seem to be realising the necessity of working in a style founded upon a sounder and more enduring basis than any of the above modern revivals, and attention is being once more directed to the works of Palladio, Sansovino and others of their school in Italy, and to the works of the seventeenth and eighteenth-century artists of our own country whom I have already mentioned.

As Wren rightly insisted, architecture should possess the quality of the eternal, by which he meant, as I understand it, that we should endeavour to produce work that not only meets with the approval of contemporary critics, but which may reasonably be expected to merit commendation from those of a future generation, and, in this age of mediocrity, we must not hastily assume, because we admire a design by any architect of to-day, that its author is therefore the creator of a work of art which will stand the most severe tests, that of time.

But although we are at length exercising wisdom in our choice of a style in which to work, it appears to me that we are not employing the right methods to enable us, or architects who are to follow us, to design buildings at all comparable with those erected by our predecessors. To begin with, the keynote of the success obtained by the great masters of the Italian Renaissance was scholarship; they recognised that originality was not to be obtained by means of general distortion and inversion of the proportions and properties of the orders so magnificently conceived by the ancient Greeks, employed by the Romans and bequeathed to future generations, perfect in their grace and harmony and unsurpassable for all time.

But modern architects are rapidly losing this old-time instinct for proportion, harmony, beauty of line and architectural scale, chiefly through their persistent efforts to ruin, by the introduction of grotesque travesties of the orders, designs which might otherwise pass as fairly successful

ones. Does any sane man contend that the art of architecture is advanced by designing Corinthian or Ionic columns with heights equal to about fifteen times their diameters or by the happy and decidedly original inspiration of combining, say, a Corinthian entablature with a Doric order? Such affectation is merely evidence, if indeed any be required, that many of us have not mastered the grammar of our profession and that our architectural education is imperfect. No new style other, at best, than one of a transient character can ever be evolved by such means, and the designs produced thereby can only meet with the approval of those of us who are engaged in the exercise of our practice under similar educational disadvantages. What would be said of a modern writer if under the plea that they were "too archaic" he ventured to transform some of Shakespeare's finest passages into choice cockney dialect, or could we take seriously the oratorical efforts of a great speaker if he clothed his wisest thoughts in the popular slang of the day?

Mediocrity is excellent to the eyes of mediocre people, but no architect who loves his profession can afford to consistently neglect its grammar, and even although he be in the enjoyment of a large practice he should recognise the fact that he is still a mere student of what ought to be regarded as a great and scholarly calling.

Never did we architects stand in greater need of a higher standard of general culture, never was there less necessity for the rank and file to follow in a servile manner and endorse the precepts and practices of certain so-called eminent men, for many of your great architects of to-day may be—and I venture to predict will be—forgotten a few years hence, not because their works lack creative ability, but because they contain little or no scholarly feeling. As the well-known French philosopher, Joubert, points out, "He who has imagination without learning has wings and no feet," and no architectural works which will delight future generations can be produced unless creative power and scholarship are both employed by their designers.

The Statutory Qualification of Architects.

In my opinion the favourable reception given to the proposed scheme for closing the door of the profession to unqualified men by means of registration is due, in a large measure, to the Institute itself, which has through its successive Councils generally favoured a policy little short of one of absolute indifference to the legitimate grievances of its ordinary members, who are now beginning to realise how impossible it is, under existing conditions, to penalise unprincipled or unprofessional conduct, and to recognise the almost insuperable obstacles that are placed in the way of those desirous of effecting measures of reform in the conduct of architectural competitions. These facts, coupled with the Institute's well-known disinclination to afford assistance to architects who in a private capacity are battling for rights such as those affecting the ownership of drawings—which question, by the way, ought in the general interests of the profession to have been made the cause of a test action or actions fought under the auspices of the Institute itself years and years ago—have had due weight with many architects who would otherwise have withheld their support to the movement in favour of registration.

The leading principles of the proposed scheme shortly to be placed before the Council of the R.I.B.A. will probably contain the following essential elements:—

1. That the Bill brought before Parliament must be one of a nature tending to increase the prestige of the R.I.B.A.
2. That the R.I.B.A. will be constituted the examining body and the registration authority.
3. That the scheme will afford reasonable facilities to enable every architect of repute and every student of average capacity to obtain registration.

Whilst we may assume that these three general principles would be components of a Bill promoted or supported by the R.I.B.A., yet the first practical effect of any Registration Act would be to stop any further increase in the number of incompetent practitioners.

The adoption of a Registration Act under its auspices would enable the R.I.B.A. if necessary, by a general revision of its by-laws, to severely penalise any member for unprofessional or dishonourable conduct, and to admit of its instituting a thoroughly comprehensive system of architectural training by which men of good general education and culture would be attracted to the profession, and to effect this steps would probably be taken to enable the R.I.B.A. to enter into negotiations with the governing bodies of all

the universities in the United Kingdom with the view of inducing them to appoint professors of architecture at their respective seats of learning.

The Reformed Profession.

And, after our Registration Bill has become law, and when through its instrumentality the flow of hordes of illiterate and incompetent men who are now overwhelming by sheer force of numbers the legitimate practitioners is effectually and finally checked, to what extent, you ask, will the art of architecture and its exponents benefit?

Well, it will take time, but the final issue of our labours can never be in doubt. Under a wise scheme of registration the average architect of the future should be a man of sound general education and culture, and as such he will recognise that he is a member of a great and honourable profession to which he is proud to belong. He will know that all unprofessional or dishonest conduct will meet with prompt and exemplary punishment, and owing to his early associations with many of his fellow-practitioners, either at the public school or university, he will be possessed of what we as a profession at present sadly lack, viz. a strong feeling of esprit de corps, and although his designs may possess little or no great creative power or originality, they will be far more likely, on account of their technical scholarship alone, to stand the test of time than those produced by an illiterate and imperfectly trained man of perhaps far greater natural ability.

Your great architects of the future will be men possessing special aptitude for their work, whose inborn ability has been carefully nurtured and systematically trained, and I venture to think you will all agree with me that such men cannot fail to produce works of a far higher standard of art than those emanating from the architects of to-day, whose technical training, such as it is, has been obtained, in the majority of cases, in a haphazard manner.

We should remember that the cause of the less successful members of our profession—the cause of reform, of equal justice, of education—must be a good one, and that those who support it must be in the right, and it is therefore our bounden duty to eliminate, as far as possible, any minor differences on registration tending to obstruct the progress of this great measure of reform, which has met with the hearty approval and support not only of a large majority of the members of the Royal Institute of British Architects, but of a large majority of members of the whole profession, who confidently expect that under its beneficent sway future practitioners will be instrumental in restoring architecture to the proud position in public estimation she has for the moment lost, but which is hers by inalienable right, as that of one of the greatest of the professions—the mother of all the arts.

What says the poet Longfellow?

to build,
That is the noblest art of all the arts.
Painting and sculpture are but images,
Are merely shadows cast by outward things
On stone or canvas, having in themselves
No separate existence. Architecture,
Existing in itself, and not in seeming
A something it is not, surpasses them
As substance shadow.

In conclusion, gentlemen, I am a registrationist because, in my view, registration means, *inter alia*, a sound and systematic course of training such as will enable an architect of average ability to discriminate quite early in his career between work that is either good, bad or indifferent, whereas under our present system of training it is only the experience gained by years of practical work which enables the eminent architect of to-day to produce, generally quite late in life, a design that in any way approaches the standard of excellence shown in the works of the well-trained and well-educated architects of the seventeenth and eighteenth centuries.

If many of the old-time men could design buildings of a monumental and scholarly type at comparatively early stages in their careers, is it not palpably absurd to argue, as I believe our opponents do, that "training fetters art"? On the contrary, is it not reasonable to believe that whilst your properly-trained architect of ability will be capable of producing consistently good work at the age of, say, thirty years, one that is untrained will be unable to give practical effect to his inborn talent until he is nearing the close of his professional career?

If we examine the works of any distinguished modern architect we shall find, as all things have a beginning, that whilst his earlier buildings are, as a rule, neither better nor

worse than those of his contemporaries, his later are far superior to those of the average architect of his time. Is not the result thus obtained late in life—the come of scholarship gathered through years of steady labour in the exercise of his profession, and does it seem probable that under a systematic course of training the scholarly feeling necessary to enable one to produce good work could have been acquired at an earlier outset of his career?

There is no doubt that unless an architect is properly educated before he commences the active work of his profession he will be unlikely to resist the blandishments of that ephemeral fashion of his art. In following the transient fashions, it seems to me that several able architects of our own time have both injured their own reputations and exercised a baneful influence upon the judgment of many of their youthful admirers and imitators.

In short, gentlemen, nothing should be left unattended to in formulating a satisfactory system of compulsory education which alone will insure the production of designs of a high and prove acceptable to future generations. Has not the poet told us that "Every human action gains in honour, in all true magnificence by its regard to things that come." It is the foresight, the great and confident principle that, above all other attributes, separates man from brute, brings him nearer to his Maker, and there is no art whose majesty we may not measure by this test. Therefore, when we build let us think that we build for the future. Let it not be for present delight, not for present use. Let it be such work as our descendants will thank us for, and let us think, as we lay stone on stone, that a time will come when those who follow us will say as they look at the labour and wrought substance of them, "See the fathers did for us!"

ROMAN CAMP NEAR MANCHESTER

PENDING the publication of the first annual report of the excavation committee of the local branch of the Manchester Association, which will not probably be issued till the end of the season, it may be interesting, says the *Manchester Guardian*, to summarise briefly the work that has been accomplished since excavations were commenced at Melandra some three months ago.

The committee set themselves definitely to answer, if possible, these three questions:—

1. What was the nature of the northern and southern gateways? No part of these had hitherto been examined.

2. Did a stone rampart completely surround the camp? Mr. Garstang had reported "traces near the chief gateway only."

3. How did the rampart join up with the four towers? Here, again, the report referred to state "the outer wall having been stripped from around the three corners . . . it was not now possible to examine the exact connection between these features of the masonry."

To the first two of these questions satisfactory answers are now possible, and the committee hope that the work of the present week may throw light upon the last, to which they already have some clue. The third question, however, important as a satisfactory answer would assist materially in determining the date of construction of the fort.

The complete excavation of the northern and southern gateways has revealed the fact that while the former was a double gate with double arches, the dimensions similar to those of the eastern gate, the southern entrance was by a single gateway with a single arch. The leading from this gate towards the Prætorium is well served and consists of coarse gravel on clay. Part of the surface has been carefully riddled, but it has yielded so far nothing worthy of note. The sections of the bank now visible are of interest, first, as showing the relative position of the mound; and, secondly, as indicating by the lie of the bricks what may have been the original slope of the mound. Immediately to the west of the north gate the excavation came upon a large quantity of charcoal. Whether this should be regarded as the remains of a fire has yet to be determined.

From this point the stone rampart has been traced almost to the north-western corner, the flag foundation for the whole distance being intact, and surmounted for part of the way by the first course of dressed stones. As the wall has also been traced for nearly 40 feet at the north-east corner, it may now safely be asserted that a stone rampart surrounded the camp.

the last few days the foundations of the north-
er have been cleared, and it has been found that
of the fort was rounded off by the wall curving
the turret. The exact method of joining will
be seen more clearly from another tower now
mined. The curve of the wall is beautifully
the part uncovered runs straight for nearly 14 feet,
arves inwards 3 feet in the next 20 feet, to meet
Judging from rough calculations the curve
seem to be the arc of a circle.

y measured plans of the gateways have been
a number of excellent photographs of the founda-
y been obtained, a selection from which will be
the report of the committee. No stones found
been in any sense disturbed, and exact measure-

ARCHITECTURE IN GLASGOW.

collection in the Royal Glasgow Institute of the
Arts this year, says the *Glasgow Herald*, is a
a, and there are missing a good many of the names
who customarily exhibit. The source is almost
ly local, for, out of Glasgow, only two English and
burgh architects are represented. The examples
nely to the class of public buildings, domestic
ries second in importance and churches follow.
t are quite unusually few, and buildings are all
in style, as the others are variants on the all-
Renaissance. As the collection is pretty evenly
between works actually executed and those only
about half are photographs. The rest are drawn
en and ink chiefly, or monochrome wash; none
water-colour or in pencil, and, viewed merely as
some have considerable merit.

ton Municipal Buildings as proposed is about the
cheme illustrated. Mr. Cullen's design was
in competition, and has a central flattened dome
les, flanking towers and pyramidal tops something
t Venetian model; a good deal of effect is got by
l rustication throughout. Another design for the
Mr. D. Barclay, illustrated by a fine wash-drawing,
de; plans of neither are given. The Theatre at
ck, also by Mr. Cullen, is placed between
g, so only one façade appears; it is much above
fortunately is the general level of excellence in our
tes, and very freely treated as befits the subject.
ed office of the North British and Mercantile
Company is a stately four-storeyed block in

Princes Street, finely shown in a geometric drawing. There
is a large order in the centre, a rusticated basement and a
main cornice, with no tower or other extraneous feature, all
quite ordinary elements in a modern Classic composition,
but as treated they allow reasonable originality. The
doorway and the window heads of the main floor are not
such as would have been done fifteen years ago. To those
who know, there is really little chance of chronological
confusion in our present-day use of revived styles; what to
some appear copies only have really characteristics peculiar
to themselves. Messrs. Hunter, Barr & Co.'s warehouse
(Mr. David Barclay), one of Glasgow's biggest, is bound
together with good effect by vertical ranges of oriels, but
the detail is coarse. In the design for Technical College,
by Messrs. Thomson & Sandilands, centre and corner
blocks are marked by slated pavilion roofs in French
fashion.

Of the small town libraries that are springing up,
Anderston is a fair example, by Messrs. Stewart & Paterson.
The dome in the reading-room is an excellent feature.
Another library, by Mr. Lindsay, is appropriate. The
municipal offices, by the same, is even better. A design for
Montrose Public Library, by Messrs. Watson & Salmond,
has a broad entrance portico that tells well against the plain
wall making up most of the façade. Kirkintilloch's Town
Hall and Council Chamber, by Messrs. Walker & Ramsay,
on the drawings have nothing to show whether these are
contiguous. Rather oddly, the lantern is the same in each.
Both are two-storey blocks; the former has had given to it
a Greek treatment. Schools are not illustrated, beyond a
sketch of one proposed at Newcastle. A Nurses' Home and
Pathological Laboratory at Lenzie, by Messrs. Salmon, Son
& Gillespie, is a good essay in brickwork inexpensively
treated; and Lanfine Cottage Home, by the same, is even a
simpler subject, but equal care is evident, and the result is
a very interesting building. Messrs. Sawers's premises,
Paisley, by Mr. Eric A. Sutherland, is something beyond the
usual street frontage, and effective too is the co-operative
building, by Messrs. M'Kissack & Son.

Of houses that by Mr. M'Kellar is the most important.
It is illustrated in two very good wash-drawings, in free
Classic manner, with a corner circular tower of up-to-date
type, but quite happily used here. Craigmyle, by R. S.
Lorimer, R.S.A., shown by photographs, is a most interest-
ing north-country mansion, built in granite overcast with
"harl"—through which the stones show, unfortunately—
and full of quaintness. The entrance-door has a fine splash
of heraldic carving over it, if the gables with curved tops
have more of Dutch than Scotch character. The lodge is
good too, but the gatepiece is rather lacking in interest.
Dalveagh, by Leadbetter & Fairley, is also Scottish
domestic and satisfactory; a plan is given. House at
Skelmorlie, by H. E. Clifford. Here length rather than
height asserts itself; the style is Late Tudor, with squat
tower, tall stone chimneys and timber gables. It is
shown by a pen-and-ink drawing. Kennyhill, by
Miller & Black, is a frame of photographs, chiefly
interiors, of a sumptuously-appointed house. A
swimming-pond and a bowling-alley are unusual adjuncts,
and the equipment of a bath-room shown corresponds.
There is novelty in the double grille at the glazed
entrance-door, and in the stained glass in screens and doors
throughout, besides in windows. Normanhurst, by Mr.
Balfour, shown by photographs. Neither exterior nor in-
terior is of much distinction, but not inappropriate. A
series of photographs of the Hill House, Helensburgh, is
by Messrs. Honeyman, Keppie & Macintosh. The perverse
austerity of the outside, where everything is covered with
rough-cast, is consistently maintained within. Fittings,
furniture, wall-hangings and foot-mats have the same
adornment of little squares pierced or stencilled. Decora-
tion according to this recipe is surely simple enough.
Messrs. Annan's building, by the same, and Gadgirth
Library, chiefly interiors, are shown by photograph, where
furniture is almost better illustrated than fabric. Middleton
Hall, by Mr. J. Macintyre Henry, is a photograph of addi-
tions to a house, widespread, symmetrical and bare, of late
eighteenth-century period. A plan is appended. Nord-
heim, by Messrs. Beattie & Morton, is something out
of the common in disposition, but without extrava-
gance. A double house, by Mr. W. Whittie, is also
plainly treated, with oriels that run up as low
towers. More in the picturesque manner is a cottage at
Cathcart by Mr. F. Rowntree, who also has Pilmuir Lodge,
which is yet more rustic—of brick, surmounted with an
extinguisher tiled roof and central chimney-stalk. Villa at

Maxwell Park, by Mr. Nisbet, has its lower storey of red stotie, the upper of rough-cast and timber gables; the interior shows some details of interest. Tulliallan Gate Lodge, by Watson & Salmon, is Jacobean in style, and attached to an imposing arched gateway, set off by an effective background of foliage. A small country house, by Mr. A. N. Paterson, has its entrance at the inner angle of an L-shaped plan. Internally modelled plasterwork of a type presently revived gives interest; a doctor's house, with plan attached, is excellent; and the proposed additions to Kyles Hydropathic, also by the same, help to produce a composition of note. This last is shown in tinted chalks. Small houses by Messrs. Mitchell & Whitelaw, D. W. Sturrock, and D. M'Naughtan have merit—the last specially. The doorways have a good deal of new art in their design. The interior of S.S. *Yongala*, by Mr. J. M. Crawford, has details on rather a larger scale than is usual in yachts.

Dalmuir and Radnor Park churches, by Messrs. Stewart & Paterson, illustrated by photos, are both simply treated; a main doorway is of interest. Baptist church at Springburn, by Mr. James Lindsay, is of good scale and dignified, if only a street frontage. Parish church at Elgin, by P. Macgregor Chalmers; here the buildings are low, so that the square tower without great height is effective—the style is Norman. One of the designs for St. Paul's Church, placed second, by Beattie & Morton, is of Late Gothic, a good deal influenced by "new art," in details principally, but affecting the tower roof of hollow line; the corner buttress is a little in the way. The halls adjoin and group well with the church. A design for St. Columba Church, by Mr. D. Barclay, differs from the one erected in having its side as frontage. There is a spire and the style is Decorated. A fresh architectural sketch rather than a water-colour proper of the porch of St. Mary's Church, Oxford, is by Mr. Wm. B. Fulton. Very little stained glass is shown: a fine memorial window for Forfar Church, by Mr. John Guthrie, is of good composition and rich in colour so far as a sketch can represent that; one by Mr. Stephen Adams is a panel from the Grosvenor Restaurant that is more of a picture, as suits its place and purpose.

ROYAL SCOTTISH ACADEMY AND WORKMEN.

THE Council of the Royal Scottish Academy have issued the following circular to employers of labour in the city, pointing out the special facilities which are now afforded for the working classes visiting the Academy's exhibition in the evenings:—"Royal Scottish Academy, Edinburgh, May 1905. Dear Sir,—The exhibition of the Royal Scottish Academy is open every evening from seven to ten. The new light installation enables visitors to see the collection under most favourable circumstances, and the President and Council believe that if this were generally realised, the public—especially the better class of artisans and their families—would take advantage of this opportunity of evening recreation. I am therefore instructed to ask if you would be willing to distribute, on application, among your men single admission free tickets? It is understood that the holders of these tickets have the privilege of procuring others at the door at 4d. each for the use of their friends.—I am, yours faithfully, GEORGE HAY, Secretary."

YAPTON CHURCH.

AN interesting account of recent discoveries made in Yapton church, Sussex, appears in the parish magazine of this month. "The puzzle," writes Mr. P. M. Johnston, "has always been as to how the church was lighted when it was first built, seeing that such things as the dormer windows, which now so abundantly light the church, were not then in use, and that there were no clerestory windows over the nave arcades. The little Norman window at the east end of the south aisle, together with one or two small openings, which must originally have pierced the west wall of the nave, would thus have been the only means of lighting the church in the twelfth, thirteenth and fourteenth centuries, unless—and this is the point that has until now always remained in question—the low walls of the aisles were pierced with windows.

"So far as the south aisle, at any rate, is concerned, this question has now been solved, for during the present week the vicar and myself," continues Mr. Johnston, "have been

able to make a careful search, with the curious little circular openings have been found in the south aisle. The eastern of these, at the end of the aisle, had been partially destroyed, but enough remains to show that there was a stone frame about a foot in diameter, of plain work, while the western, otherwise similar, is a window of quatrefoil shape. These openings were fitted and rebated to hold glass, but plain leaded glass was found of their having been blocked up on the occasion of their being turned into recesses at some date like 1400; when the large dormer windows were made, they were bricked in and plastered over. Yapton should be proud of these, the latest of the church's antiquities, as there is nothing quite like them anywhere. Any of the low aisle walls of this part of Sussex to go as far as Piddinghoe, near Lewes, to find the same character."

AMERICAN PLANS IN CANADA.

TWO new important buildings for Toronto have been put into the hands of United States architects, the *Canadian Architect*, and the duty on plans collected on a valuation of the blue prints that are based upon the time supposed to be taken by a man in producing them. If there is to be a creditable that its collection should be made a duty on the Government—not the present Government—did acknowledge at one time that the duty should be collected on the cost of the drawings (and not blue prints) but that the duty should be collected on the cost of the importer. The irritating point in the architects is that the best architect in Canada is allowed to erect a hen-house in the United States; another point, equally irritating, is that while the States architect is employed in Canada, he has a better chance in the way of expenditure than the Canadian. His clients are, in fact, a good deal more liberal. As they have sent to New York for advice, would be silly not to take his advice. The effort is to raise the high-water mark of cost all round, far as that is a good thing, we ought to be able to do ourselves.

AMERICAN PRACTICE.

FOR the first time in our history, says Mr. Johnston in the *American Architect*, we have a man educated for a special purpose, who have as their duty to keep abreast of our national development in the main departments of the work for which they are trained. This failure is not due to want of ability. Most of the architects of the new generation are virile and cultured men. But virility and culture accomplish nothing without concentrated effort. The pressure of our modern industrial system has been diverted to other and more urgent channels. This being a materialistic age, the vast majority of the buildings of the character that makes for architectural development are erected for purely commercial purposes. Every advance in science and mechanics is eagerly upon. Radical changes in the building arts are required to adapt modern construction to such an extent that the man can grasp their intricacies and honestly present himself an expert. The changes which the business of the building trades are undergoing are equivalent to a revolution. This is an age of feverish business haste. As we pride ourselves upon the promptness with which we accomplish results. Economic success in building is generally dependent upon rapidity of construction. The owner and contractor show an increasing tendency to be through corporate interests. The mechanic, and frequently the contractor can be dealt with through their organisations, through which the building industry are utilising and developing the forces of cost to the fullest extent.

In the midst of this feverish haste the architect is posed to be an authority in all the varied services for the construction of a huge modern work within a minimum limit of time. A busy architect may find such structures under weigh coincidentally. To vitalise his claim to perform mechanical and scientific service in an expert capacity, he attempts to keep the times by acting as civil engineer, sanitary expert,

ing specialist, professional electrician, and so through the whole gamut of endeavour necessary for the solution of his complicated constructive problems. Sometimes he employs professional assistance, but he attempts to supervise the work of the experts with most exactness, notwithstanding the fact that this is in itself a study to which other men devote their careers.

The architect's claim as an authority in economics is based upon the exigencies of his employment. The architect's exact and careful supervision of financial affairs being paramount to all other considerations. The building must be constructed at the minimum cost and must yield the maximum income. This duty is imperative. The architect is delegated to employ, as is the case with the engineer, more strictly architectural functions of his profession. To hold his *clients* the architect gives the best of his thought to the business of answering this. He involuntarily bends his energies to this end, and becomes thoroughly familiar with the latest and best methods of construction, in order that he may erect his building with the utmost despatch. and one year's loss of rentals may mean financial disaster to his client, and hence to himself.

In the few moments that he has to spare from his other duties he occasionally attempts to design, or make the roughest sort of a sketch, which is then sent to a draughtsman for further elucidation. More often the sketch itself is the work of the draughtsman, and the architect exercises purely advisory supervision. When the design is finished the architect signs his name, and assumes responsibility.

Under these conditions most of our architectural works are done by men whose lack of experience prevents acquaintance with existing sociological conditions, and the knowledge of which is essential to the creation of a new type. Generally these draughtsmen have had no real training in the schools. Historic style is a mere resource. Mistaking transient modes for permanent, they are compelled to achieve results with that careful study is impossible, and even for the desire to be original the text-book becomes the only safe guide.

When the draughtsman has obtained the necessary training to make him a competent designer, he too becomes an architect, and, if successful, must in turn leave his position to subordinates. These young men, fresh from the schools, the real sponsors of most American work are apt to be orthodox in their tastes. Their training prescribes exact rules of procedure. In the early years of their careers, which is the only period when they are free to design, they have not yet learned that their training was simply a preparation for the designing of the actual problems of an architectural practice. The influence of this system much American design is mere judicious copying, and it is commendable in proportion to the judiciousness with which the copy is accomplished.

What is the future? What has architecture to offer in the development of our national art? Its ranks are being recruited from the best types of our young men, whose training in the technical schools, both at home and abroad, is equal to any that the world affords. Many of our architects are men of broad view and great energy. Here are two conspicuous examples of American architects who have devoted time and concentrated energy to designs, whose work shows strong personal and original characteristics. It has devolved upon a Philadelphia practitioner to demonstrate to the world of American designers to meet modern conditions untrammelled by precedent. The Westerner's solution of the steel-frame building is as modern and national as the building itself. It plainly indicates its structural character. It makes no pretence to being supported by masonry. The large expanse of windows laughs at precedent, and claims a new and light structural material. The architect's treatment of the more humble problems of domestic architecture is equally original, for although he is perfectly familiar with historic style, he has chosen to proceed according to his own untrammelled taste. So the lack of harmony between Gothic mouldings and modern ornament, and the results have justified his choice. The whole profession has contributed to the development of the small American suburban residence, and the same dwelling is one triumph of national architecture in which all of the workers may claim a share. There

were no precedents to hamper the designer. There were no historic motives in the material used. There were no complicated methods of construction such as are involved in the larger works. The problem was purely architectural, and its solution appealed to that large middle class which is itself so characteristically American. The result has proved satisfactory, whether considered from an economical, mechanical, artistic or national point of view. It is the one bit of purely American architecture evolved under conditions compelling and permitting original artistic thought.

Thus in this isolated field, where the American architect has expended time and energy, he has produced national types, and in the realm of science and mechanics, where economic necessities have compelled constructive inventiveness, he is also thorough and original. How can the American architect be allowed to devote equal energy and to obtain equal results in the broader art of design which, in its ultimate aim, is the quality which distinguishes him from the engineer?

In England, where the same conditions obtain to some extent, a small band of men is attempting to solve the question by making it a rule to accept only a limited number of commissions in each year; agreeing with each client to devote personal attention to his work, with the understanding that the fee be increased above the usual amount.

In the United States the solution is being forced by our corporate interests. This is an age of specialised and co-operative effort. Modern industry is subdividing its energies to the utmost. It puts definite metes and bounds to every man's labours, and exacts of each only the work for which he is best equipped.

The greater portion of our large architectural works are no longer promoted by private patrons. Corporations large and small are now in control. Their activities functionise the powers of the owner as well as the contractor, and frequently appear in both capacities. At the head of each of these enterprises is an expert in executive management. He knows to a nicety just what he requires of each unit under his control, and realises their limitations with exactness. He knows that as business counsellors his financiers excel. He appreciates fully that his mechanical experts are far more competent to advise in heating, in electricity and in engineering problems than his architect. But he knows further that no one is as competent as his architect to design and to assemble his multifarious technical forces. He needs the architect as a supervisor purely in an advisory capacity. He therefore insists that the architect should simply design and assemble the constructive parts, and he places the burden of the details of business, of mechanics and of science with those best fitted to render the maximum amount of expert service.

This is the system of the large corporations whose activities are becoming such a revolutionary force in the building trades.

Their programme is being imitated by the small corporation especially formed in order to finance one building, an arrangement so frequent that in our large centres of population the private owner is almost eliminated. The system is bound to reduce the power of the architect as a business force; but when he is shorn of many of those duties which now consume all of his working hours he will again have leisure to devote his abilities to his specialty. Thus the disease is its own cure, and the economic evolution which has forced the architect into a position alien to his art will in time restore him to his proper place. He will then be able to create, to construct, and, above all, he will again design. With the enormous energy and undoubted ability which is our national endowment, who can doubt that under these conditions the American architect will produce new types truly national artistically as well as constructively, and not copies of the forms and methods of older lands?

The Council of the Society of Arts at a meeting last week passed the following resolution:—"In view of the feeling which appears to have been aroused amongst some of the proprietors of the London Institution with regard to the proposed amalgamation with the Society of Arts, and the consequent probable difficulties of effecting a harmonious fusion of the two corporations into a single institution, the Council of the Society of Arts have decided not to take any further action in the matter, and hereby discharge the committee which, at the instance of the Board of Managers of the London Institution, they appointed to consider the scheme for amalgamation."

GENERAL.

Mr. G. H. Widdowes, assessor in a competition for the erection of a new boys' school at Buxton, has placed the plans as follows:—(1) Mr. Charles Swain, College Road, Buxton and Manchester; (2) Messrs. Garlick & Flint, Buxton; and (3) Mr. W. R. Bryden, Buxton. Mr. Swain's estimate was 4,000*l.*, and it was decided to recommend the adoption of his plans to the education authority.

An Exhibition of works left by the late Mr. G. H. Boughton, R.A., will be opened on Saturday, May 20, at the Leicester Galleries, Leicester Square. It will include oil-paintings, pastels and a collection of landscapes in water-colours. The exhibition will remain open for one month.

Mr. A. S. Parker, architect, Plymouth, has been awarded the first premium of 50 guineas in a competition for proposed extension of the police court and fire brigade dépôt in Bristol. The estimated cost of the scheme was 48,000*l.* The second premium went to Mr. H. Williams, Bristol, whose plans were estimated to entail an expenditure of 53,000*l.* Fifteen plans were sent in. The work has been postponed for three years.

The Death is recorded, at Scarborough, where he had resided for some years, of Mr. William Crozier, M.I.C.E., formerly surveyor for the county of Durham, a position now held by his son.

Sir Caspar Purdon Clarke, C.I.E., the director of the Victoria and Albert Museum, will be entertained at a public dinner prior to his departure to New York. The executive committee, which includes the Earl of Carlisle, Sir E. J. Poynter, P.R.A., Lord Balcarras, Sir George Donaldson, Sir L. Alma-Tadema, R.A., have proposed June 28 as the day.

The Committee of patronage for the International Art Congress, to be held in Venice in September, has been appointed. Great Britain is represented by Sir W. B. Richmond, R.A., Mr. W. M. Rossetti, Sir Aston Webb, R.A., and Lord Windsor.

The Cookham Rural District Council have selected Mr. T. Street, formerly surveyor for the parish of Hurley, for the post of district surveyor. There were more than 100 applicants.

The Home Secretary has decided that for the year 1905 the remuneration of the members of the Tribunal of Appeal under the London Building Act, 1894, shall continue upon the same scale as heretofore. Under this scale each member of the Tribunal receives three guineas for the first hour and two guineas for each subsequent hour of each day's sitting.

Brington Church, near Northampton, is to be restored when the necessary funds have been collected. The church is noteworthy as being the burial-place of the ancestors of George Washington and of the Spencer family.

Mr. G. McDonell, district surveyor, South-West Islington, having passed the age of sixty-five, has sent in his resignation as from September 30, 1905.

The Chichester City Council have received 123 applications for the surveyorship, although the inclusive salary is only 150*l.* The election will take place to-day.

The Leeds University Council have appointed Mr. James Gilchrist, B.S., to the lectureship in civil engineering vacant through the death of Mr. George Wilson. Mr. Gilchrist is a graduate in science of the University of Edinburgh, with first-class honours in engineering. He has had varied and wide experience as a practising civil engineer, and is at present on the staff of the engineer in chief of the Caledonian Railway.

The Council of the Edinburgh Architectural Association, at a meeting on the 11th inst., considered the terms and conditions upon which a parish council propose to elect an architect and superintendent of works. On the ground that the remuneration offered was far below the recognised scale of professional charges, the Council of the Architectural Society expressed disapproval of the same and resolved to communicate with the parish council on the subject, and to ask them to reconsider the conditions of appointment.

The Birmingham Art Gallery has been presented with a large landscape painted by Thomas Creswick, R.A.

The Window designed and made by Mr. John La Farge, of New York, and presented to St. Saviour's Cathedral, Southwark, by Mr. Choate, the United States ambassador, as a memorial of John Harvard, founder of Harvard University, will be unveiled by his Excellency and dedicated on Monday.

Cambridge University has received from Wilkin, of Wadhurst, Sussex, an offer to endow a scholarship in memory of his son, Mr. Anthony Wilkin, of King's College. The benefaction is intended for the furtherance of ethnological and archaeological researches, preferably for fieldwork among the more primitive peoples of Greece, Italy or Egypt.

The Church of St. Michael Coslany, Northampton, has not been used for the past seven years, is to be pulled down. The structure is in a ruinous condition.

M. Stehukine, a Moscow collector of objects of art, has given to the Moscow Historical Museum his collection of objects as well as the building and land on which they are stored. The value of the gift is estimated at four millions of rubles.

The Baldacchino over the high altar in the Cathedral of St. Peter will shortly be erected. It will cover a space of 31 feet by 15 feet. The central space over the altar will be covered by a vault 15 feet wide, supported by four columns of deep yellow Verona marble. All the columns will be placed on pedestals of green marble from Carrara. The bases, capitals, mouldings and carvings generally will be of ivory white marble, while the flat surfaces will be of variously coloured marbles, lapis lazuli, and gold. The vaults and ceilings are to be constructed of concrete and covered with mosaic.

Experiments on Nickel Steel have been made at the Watertown Arsenal, U.S. They demonstrate that the elastic limits and tensile strength, accompanied by ductility, result from the addition of nickel to steel.

Cheddleton Asylum is to be enlarged in order to accommodate 400 additional patients. The outlay will be a heavy addition to the expenditure of the Staffordshire Council.

The Provincial Association of French Architects held their general meeting at the Château de Blois, France.

The Woking Urban District Council have instructed a sanitary committee to "take into consideration the desirability of so modifying the building by-laws as to provide for the erection of cheaper cottages."

The French Minister of Fine Art has announced the disposal of 30,000 francs in premiums varying from 1,000 francs, which will be awarded to artists who have completed two years whose works in either of the said categories are considered to indicate ability that merits encouragement.

The Late Mr. Stanley Connor, an American sculptor, died last year in Florence, has bequeathed to the city of Florence one of his models.

M. Gustave Michel, the sculptor, has been appointed professor in the Ecole des Beaux-Arts, as M. Engelbert.

M. Georges Lefenestre has commenced a course of lectures in the Louvre on Sandro Botticelli and his contemporaries in Florence and Rome.

Mr. Holman Hunt's latest work, "The Lady of Shalott," will be on Saturday and afterwards exhibited at Tooth's galleries in the Haymarket.

The Visit of the Edinburgh Architectural Association to-morrow will be to Dundee, when the old buildings will be examined with the aid of members of the local Institute of Architecture.

Mr. H. Percy Boulnois, inspector of the Local Government Board, recently conducted an inquiry into an application by the Corporation of London to borrow money for connection with the new scheme of sewerage disposal. The Corporation were authorised under the Act of 1901 to borrow 290,000*l.* for this purpose, but the amount was found insufficient by 30,000*l.* An application was also made for the period of repayment to be extended from forty to sixty years, but Mr. Boulnois expressed doubt whether this would be granted. The whole of the work except the erection of the pumping station, is virtually completed.

French Delegates from the Council-General of the Department of the Seine, who are paying a visit to London for the purpose of studying the latest methods of purification of sewage in our large towns arrived from Paris last week. The members of the delegation were M. Grebauval (president of the Council-General), M. Moreau, Chenal, Jolibois, Parisot, Carnignac, Jacquemin, Thomas and Levée (councillors), M. (director), M. Bechmann (chief engineer), Dr. (director of the Pasteur Institute at Lille), MM. (engineers), and M. Garnier (secretary).

THE WEEK.

CUSTOM has, we suppose, dictated that a Bill for the Registration of Architects should be again introduced, although any Parliamentary agent would have pointed out there was not the least probability of it becoming an Act. Like its predecessors, it is presented by Mr. ATHERLEY-JONES, and it is supported by Sir WILLIAM CODDINGTON, Mr. WALLACE and Sir CHRISTOPHER FURNESS. The short title is the Architects Act, 1895, and it is assumed that it will take effect from January 1, 1906. It is proposed to have a general council of architectural education and registration, consisting of five persons nominated on the advice of the Privy Council, five representatives of the Royal Institute of British Architects, one of the Royal Academy, one of the Irish Institute, two of the Society of Architects, two of the Architectural Association, five of the provincial societies and nine of the registered practitioners. The members shall hold office for a term not exceeding five years. Registrars and other officers are to be appointed. Fees are to be paid to members of the general council as well as travelling expenses. Fellows and associates of the Royal Institute of British Architects, the Society of Architects or of any architectural society affiliated with the Institute shall be entitled to be registered on payment of registration fees. All applicants for admission after the passing of the Act must not be less than twenty-one. An apprenticeship entered upon after the passing of this Act must be served under indenture to a registered practitioner or practitioners. Any person not registered shall not be entitled to use the name of architect, and any such person who uses the name shall be liable to a fine not exceeding 20*l.*, and on repetition of the offence 50*l.* Qualifying examinations are to be held by the Institute or other body appointed by the Privy Council. None but registered persons are to be entitled to recover charges in any court of law for professional services, or to hold public appointments in which the preparation, examination, approval, or passing of buildings is concerned. An exception is made in favour of members of the Institution of Civil Engineers and of the Surveyors' Institution. The term "legally qualified practitioner" is to mean a person registered under the Act. Arrangements are to be made for the registration of colonial and foreign practitioners.

As Mr. Justice LAWRENCE impounded the documents used in *MEABY and Another v. Hearts of Oak Benefit Society*, and promised to hand them over to the Public Prosecutor, we cannot, of course, discuss the merits of the case, although it is one in which all architects will take an interest. But it throws a light on a system of obtaining business which it is to be feared is often employed at the present time. Everyone knows that one of the ways to commercial success is to erect an imposing building, and several benefit societies are expending large sums of money on new offices. The Hearts of Oak resolved to devote 55,000*l.* to the erection of premises in the Euston Road, in addition to 36,000*l.* for a site. There was a competition, and Mr. MEABY, the Society's surveyor, obtained the second place. Afterwards his plans were adopted by the Society. He calculated that at 1*s.* a foot the building could be erected for 46,048*l.* There was some alteration in the building-line, and in consequence a new set of plans had to be prepared. The plaintiff in consequence said he believed the old stipulations of cost were no longer binding. The Society, however, considered that the new plans would cost from 80,000*l.* to 90,000*l.* or more, and therefore held that the arrangement between the Society and the plaintiff was at an end. The plaintiff sought to recover 3,374*l.* for his services, while the Society counter-claimed 1,240*l.* 3*s.*, the amount paid to a surveyor for

taking out quantities from the plans. The plaintiff's evidence was of a kind that was unsatisfactory to his counsel. The jury decided it was not worth while listening to any more, and the Judge said that the matter was not one which could end there. The remarkable fact was that the plaintiff, although he was surveyor to the Society, and in such a position his capabilities should be known, was allowed not only to compete, but to receive the commission for an important building, although apparently his greatest architectural achievement was the erection of a house and shop. No doubt a competent man was obtained to prepare the designs, and we suppose he would also be competent to look after the erection of the building. But the whole responsibility would, of course, remain with the man who had served as surveyor. When ordinary individuals engage on schemes in an unwise manner the Courts can interfere on the application of their relatives. Members of benefit societies would do well to insure that their representatives who enter on large contracts for buildings have the assistance of architects, surveyors and builders about whose rectitude there can be no question.

It seems to be inevitable in this country that certain classes of public buildings are sure to be monopolised by a few architects. It is unquestionably an advantage to have specialists; but in an art like architecture anything useful which can be devised is sure to be imitated. When work is retained in a limited number of hands it is likely to become stereotyped, and there is an advantage in allowing several minds an opportunity for considering whether new solutions of difficulties cannot be employed. At a recent meeting of the County Councils Association the question arose about the economical gain of architectural monopoly. Mr. J. WILLIS BUND declared that there was something like a "ring" for the erection of asylums and hospitals. The Lunacy Commissioners preferred men who knew their requirements, and if a county council did not select one of those architects the members would suffer. The favoured architect, he said, was sure to have a preference for some builder. In that way, according to Mr. WILLIS BUND, the cost of one asylum ran up to 32*s.* a bed. Great extravagance was also seen in the erection of isolation hospitals. As a result it was resolved to call the attention of the Government to the matter.

THE most popular of DANTE ROSSETTI's paintings is the *Dante's Dream*, of which the Liverpool Corporation are the fortunate possessors. One proof of this fact is to be found in the number of applications for its exhibition in different places. Although in 1891 the arts committee of the Corporation came to the resolution that the painting was not to be again lent, it has not always been kept in the art gallery. At a recent meeting it was decided to send it away in order that it might be relined. Mr. HARFORD, who is a member of the committee, has objected to the proposal, for he considers the operation should be carried out in the Liverpool gallery under the supervision of experts. That travelling is not beneficial to ROSSETTI's work is suggested by one of its journeys abroad in order to be photographed. According to Mr. HARFORD, "When the picture arrived back in Liverpool it was discovered, to everybody's dismay, that during its absence it had been revarnished without authority from the committee. One is justified in asserting that something had been done to the picture, and that it was revarnished to cover it up. Everything now points to the fact that whatever the process was that it went through it necessitated revarnishing, and that the canvas has become weakened to such an extent as to cause the upper part to give way and leave the stretcher. This is most unusual in ROSSETTI's pictures, so profound was his knowledge of his materials."

THE ASSOCIATION SKETCH-BOOK.

THERE are so many successful examples in the series of volumes of the Sketch-Book of the Architectural Association, the contributors of late years can hardly fail to become emulous and produce plates which are superior specimens of draughtsmanship. It is, of course, easy to be fascinated by some examples of architecture and then to attempt picturesque representations of them. But for a student of architecture the process of measuring is more profitable as discipline than any freehand drawings such as the young painter would give. We are glad to see that the majority of the plates in the latest issue are the results of measurement rather than of sketching. It is also satisfactory to find that except in a very few unimportant instances there is no attempt to employ photography. Volume VIII. of the third series may therefore fail to be as attractive a table-book as some of its predecessors, but it is acceptable as an exact record of a variety of subjects, and evidence of sterling if unostentatious work.

The first example by Mr. E. GUNN shows the thirteenth-century font in Barnack Church; local stone was no doubt utilised, and the sharpness of the ornament is a testimony to the endurance of the old "rag." Mr. C. WONTNER SMITH has several views, including Burford Church, the west window in the tower of Campden Church, the Trinity Chapel, Cirencester, the tower of Fairford Church, part of Minchinhampton Church, Northleach Church, Pershore Abbey, Stow-on-the-Wold Church and fireplace in Upper Swell House. They are reproduced from freehand drawings in pencil, and are suggestive not merely of general effect, but of detail. Two plates of carving from Venice represent a different style of work, but are also characteristic of the original treatment. The curves in the panelling of the Frari Church are given with rare precision. All of them appear as if "knocked off" by Mr. SMITH *con amore*. The Queen's House at Greenwich is the subject of three plates by Mr. HORACE CUBITT. In the designing INIGO JONES, WEBB, his assistant, and WREN appear to have aided. It is Italian, but without much variety. Mr. C. H. MURRAY has selected the lady chapel at Lichfield, which from its size is a suitable subject for a page. The cloisters of Westminster Abbey have been shown on four sheets by Mr. F. WINTON NEWMAN and on two by Mr. BAXTER GREIG. The former are the more elaborate. The vaulting is skilfully delineated. St. George's Church, Hanover Square, has been selected by Mr. C. F. CALLOW. There was a time when JAMES's building would not be thought worthy of measurement, but by modern canons it is believed to have much to recommend it, and it is at least adapted for fashionable weddings. We cannot praise the drawings for neatness; lines are not uniform in thickness, and there is much carelessness in their junctions. The plates seem to be reproduced from tracings executed in a hurry. Two houses from Stamford are shown in measured drawings by Mr. EDWIN FORBES. They are good examples of seventeenth-century work, and are worth comparing with the house in Upper Westwood, Wilts, which Mr. A. D. THACKER gives. The latter is of somewhat earlier date, but it would be considered as not so well adapted for modern needs. The monument to Sir WILLIAM POPE, in Wroxton Church, is given by Mr. A. E. BULLOCK. From the figures and the quantity of the ornament the subject is difficult, and has been very carefully rendered. Details from Convocation House, at Oxford, have been selected by Mr. J. GILLESPIE, and are drawn in workmanlike style.

Scottish buildings offer a pleasing variety when introduced among English examples. Craigievar Castle, to which Mr. ANDREW ROLLO has devoted seven sheets, dates from 1610, but it might belong to an earlier period. The house occupies an area of not more than 50 feet by 40 feet, and yet from its height has an imposing appearance. The hall has elaborate carving; over the fireplace is a large carving of the arms of JAMES I., as king of

England and Scotland; the ceiling amidst the strap ornament presents portraits of ancient rulers. All the details are shown, even to the hinges. The west doorway of Jedburgh Abbey is treated skilfully by Mr. J. GILLESPIE. It is twelfth-century work, and exemplifies Scottish Norman, which sometimes was more interesting than any English varieties. Mr. J. M. KOTT shows a well canopy at Pinkie House, Musselburgh, which from its refinement must have been designed by an artist.

We may always expect foreign examples in the Sketch-Book. Mr. F. C. MEARS has taken the remains of the ancient house which are in the grounds of the museum at Rouen, part being modern restoration. It is easy to imagine from the drawing the attractiveness of the house when it was in habitable condition. In style it has the luxuriance of late Rouenese Gothic. Mr. P. J. MARVIN offers four studies of German and Swiss towers which he made in 1875. Mr. D. T. FYFE suggests the character of S. Abbondio, Como, and of the Palazzo Costabili, Ferrara. As a rule, people are content with the lower part of the sacristy of San Lorenzo, Florence, in which the great Medici tomb by MICHEL ANGELO is placed. Mr. A. NOBBS has had the courage to represent the whole structure to the cross above the lantern. It is an advantage to have so important a set of drawings, which, however, suggest that they were produced under difficulties. Sta Maria sopra Minerva is the only Gothic church in Rome. The tomb of Bishop DURANTUS, which is the subject of Mr. H. MORLEY's drawing, indicates the influences both of an earlier and a later time. Sculpture, mosaic and fresco are combined. The seated MADONNA recalls CIMABUE, but the attendant saints are less striking. The prelate was a Frenchman, who preferred an obscure diocese to the Archbishopric of Ravenna. The most important of the Italian examples is the noble church of the Madonna, in Podi, which used to be ascribed to BRAMANTE. FERGUSON said it is the only church wholly by him which now exists, and he adds, "though neither very large nor very elaborate in its decoration, it is a very beautiful church, and forms a perfect pendant to ALBERTI's church at Mantua; the one being the earliest and best type of the Basilican, as the other is of the domical or Byzantine form of the Renaissance." On the drawing the exterior is credited to COLA DI MATTEUCCIO DA CAPRAROLA, A.D. 1504 or 1508, and the interior to AMBR. DA MILANO and FR. DI VITO LOMBARDO, 1517-24; the dome was added in A.D. 1606.

Each volume of the Sketch-Book is evidence of the loyalty of the members to one of the institutions of the Association. If other circumstances permitted it would, we believe, be practicable to bring out volumes more often. It must be a difficult task where so many members are anxious to see their plates reproduced to decide upon a selection. Style as well as subject has to be considered, and it must be acknowledged that the endeavour to produce acceptable plates has had a beneficial effect on the draughtsmanship of this country. Mr. W. G. B. LEWIS and Mr. W. A. PITE can be congratulated on their success in obtaining so varied and excellent a volume.

THE RIGHT TO LIGHT.

BY A BARRISTER.

IT may perhaps be thought that when the House of Lords has pronounced an authoritative judgment such as that in *COLLS v. the Home and Colonial Stores*, and when it has thus laid down a definite principle for the decision of a certain class of cases, the uncertainty of the law dealing with such cases will at once be laid to rest. In reality it is not so. The very fact that a case is a leading case implies either that it lays down certain new and far-reaching principles, or that it sets old principles in a new light. Some time is needed both to familiarise the minds of lawyers to the new environment and to settle the exact application of the principles.

themselves. These general remarks are illustrated by the case of *KINE v. JOLLY*—a recent case upon the right to light which has divided the Court of Appeal. We shall state the facts of that case, and say something about the judgments delivered thereon, because it deals very carefully with the scope and interpretation of the principles laid down in *COLLS v. the Home and Colonial Stores*, and because it unfortunately tends, as we think, in some degree to obscure their application.

The judgment of the Court of Appeal was founded on the facts as found by KEKEWICH, J., and those facts, so far as they are material to the question which we intend to discuss, were as follows:—The principal cause of complaint was the obstruction of light to the plaintiff's morning-room. Before the obstruction it was an exceptionally well-lighted room, and even after the obstruction it was well lighted. The room could still be used for the purposes for which it was designed. But it had ceased to be so cheerful a room, and had thereby lost a great part of its special advantage and charm. The learned Judge, on these facts, came to the conclusion that the obstruction of the light was a nuisance. The Court of Appeal affirmed this judgment, ROMER, L.J., dissenting.

It was conceded on all hands that the question whether the obstruction to the light was a nuisance was the question to be determined; and that a man cannot complain of a nuisance unless, to use the words of VAUGHAN WILLIAMS, L.J., "that which has occurred is a substantial interference with his comfortable and profitable occupation of his dwelling-house or warehouse or house of business." It was clear in this case that the room was still sufficiently lighted for use for the purposes for which it had been designed, *i.e.* as a morning-room—that, in fact, it was still well lighted. It was equally clear that the room had less light than it enjoyed before the obstruction, and that in consequence the letting value of the property had been diminished. It was held by VAUGHAN WILLIAMS and COZENS-HARDY, L.J.J., that therefore the obstruction was actionable. Two short extracts from their judgments will show clearly the ratio decidendi. VAUGHAN WILLIAMS, L.J., said:—"They [the expert witnesses] say that the house has diminished in value to the extent of, I think, 20% to 25% a year; and even if it were taken at a less sum, I cannot doubt but that the house must have been made substantially less comfortable and convenient according to the ordinary notions of mankind by reason of the obstruction." "Is it any answer," said COZENS-HARDY, L.J., "to say that the room is still a well-lighted room? I think not, if the building makes the room less fit for occupation, and I do not think that we can bring in the phrase 'according to the ordinary notions of mankind' to cut down the effect which would otherwise result from a building of this nature. I for my part accept the findings of fact of KEKEWICH, J. He has found, as I read his judgment, that the letting and selling value has diminished, and that the plaintiff's morning-room is materially affected, so far as the comfort and convenience of the morning-room are concerned. That being so, I agree with my Lord that there is a good cause of action." If, in fact, the letting or selling value of a house is diminished, if the comfort and convenience of the occupier is affected, an action will lie, even though the room is well lighted and capable of use for the purpose for which it was designed.

ROMER, L.J., as we have said, dissented from the majority of the Court. He considered that the findings of KEKEWICH, J., really negatived the idea that any nuisance had been caused. The room was still well-lighted and capable of use for the purposes for which it was designed. It is true that the "cheerfulness" of the room had been interfered with, but that did not mean that its comfortable and profitable use as a dwelling-house had been rendered impossible. A deprivation of "cheerfulness" which leaves the room still well-lighted, still capable of comfortable use as a morning-room, is no nuisance in law.

It seems to us that there is much to be said for the view of ROMER, L.J. No doubt a deprivation of cheerfulness would diminish the letting or selling value of a house. No doubt it might in some degree affect the comfort of the occupier. The question is whether the plaintiff had a right to that especial degree of cheerfulness and comfort. If a warehouse has had the use of an extraordinary amount of light, and that light is diminished by an obstruction, the letting value of the warehouse would be diminished, and likewise the comfort of those who used the warehouse. But the great principle which *COLLS v. the Home and Colonial Stores* laid down was that mere diminution of that extraordinary amount of light would not be actionable unless it caused a nuisance (see *The Architect*, March 17, 1905). To infer a nuisance from the diminution in letting value and the diminution in comfortable user is to bring back again much of the old uncertainty which we thought *COLLS v. the Home and Colonial Stores* had set at rest. Such facts may, indeed, be evidence of a nuisance, but they are not conclusive evidence. If they are to be regarded as conclusive evidence of a nuisance we must modify our views as to the proper test of what is and what is not a nuisance. The test will no longer be, are the premises less fit than before for ordinary business or ordinary occupation? Rather it will be, are the premises less valuable and less comfortable than before to the present plaintiff? The view that a room can still be well lighted, and still be capable of being used for the purpose for which it was designed, and yet the obstruction of light can be a nuisance, seems to enlarge the conception of a nuisance, and to obscure the distinction between a "partial inconvenience" and a "real injury" upon which that conception rests. It is easy to see that many cases will arise in which the obstruction complained of is on the border line between these two categories. But we must confess that the findings of KEKEWICH, J., induce us to think, with ROMER, L.J., that this case should have fallen into the former rather than into the latter category. No doubt the findings of fact in this case created much difficulty. But, however that may be, we think that all those who have anything to do with building operations would be sorry to see the broad principle laid down by the House of Lords in any way obscured by subtle distinctions which tend to illustrate the cleverness of those who lay down the law rather than to promote the convenience of those who are bound to obey it.

THE THEORY AND CONSTRUCTION OF GIRDERS.*

THE invention of the wrought-iron beam is to be credited to WILLIAM FAIRBAIRN. The new support was only a development of the cast-iron beam, and the theory was of a very simple kind. The breaking weight was easily found as soon as the area of the beam, its depth and breadth were known, the constant being derived from experiments. But in the course of sixty years a beam has come to be looked upon in a different aspect to that in which it appeared to the eyes of the engineers who had constructed the early wrought-iron bridges. It is not to be concluded that the formulæ used were incorrect, for beams can still be made by their aid which will be enduring. But on the whole there is more economy when the modern system is applied. MR. ATHERTON'S book is essentially modern and practical. Instead of beginning with a consideration of an abstract beam, he treats of one under the form of a beam of a Cornish engine, or as

* 1. *An Introduction to the Design of Beams, Girders and Columns in Machines and Structures.* By William H. Atherton. (London: Charles Griffin & Co., Ltd.)

2. *Constructional Steelwork: being Notes on the Practical Aspect and the Principles of Design.* By A. W. Farnsworth. (London: Charles Griffin & Co., Ltd.)

one of the slides for a 68-ton gun or as a crane jib. In that way the student is at once made acquainted with actualities, and he comes to ascertain what forces are warring against the stability of a beam and how they are neutralised. In all beams it is supposed that there is a plane where the opposing forces die out and there is equilibrium. It is commonly said that in a section a point of the neutral axis corresponds with the centre of gravity. What Mr. ATHERTON remarks on the subject will suggest the spirit of the book:—

This rule is much too often stated without the slightest explanation or qualification. But we require a reason for it, as the justice of the rule is not obvious on the face of it. Why should the neutral axis pass through the centroid of the section of the beam? The reason assigned by one writer is, "Because there is then just as much metal above the neutral axis as below it." He adds that "this can only hold when the material is as strong in tension as in compression," thus implying that for beams made of such a material as cast-iron—which is far stronger in compression than in tension—the neutral axis does not pass through the centre of area of the section. As the assertion that the neutral axis does pass through the centroid of every section lies at the very root of the regular strength formulæ for beams, and as so many engineers seem to have no idea why it does, but are content to take the rule on trust, without troubling themselves about the rationale of the matter, it will surely be worth while looking carefully into the grounds of this assumption. Mere rules, divorced from principles, are to be distrusted, especially if they seem to be opposed to common sense. . . . The exact statement of the case is this. The neutral axis of a stated plane transverse section of a loaded beam will pass through the centroid of that section, provided that the tensile modulus of elasticity of the material composing the beam is exactly equal to its compressive modulus of elasticity, but not otherwise. In other words, the material must be such that

$$\frac{\text{pull per unit area}}{\text{extension per unit length}} = \frac{\text{thrust per unit area}}{\text{compression per unit length}}.$$

In the case of materials for which the tension modulus is less than the compression modulus, the neutral axis should be placed rather nearer to the compressed face of the beam than the centre of area of the section. But as a matter of fact, the shifting of the neutral axis due to this inequality is so small that it is commonly neglected altogether in practice. The whole question of the proper location of the neutral axis is one of considerable difficulty, and has given rise to much contention.

In the other parts of the treatise there is a similar endeavour to enable the students to realise the theory of girders, and not to be satisfied with accepting formulæ as if they were charms. Examples are given which show the applicability of the reasoning to girders of various kinds and sizes. Mr. ATHERTON is not, however, to be taken as a revolutionist who wishes to initiate a new system. He respects results which have stood their ground. Thus in speaking of the trade catalogues of rolled girders he says that some men prefer to ignore the tables. He, however, believes they can be used with advantage, but he warns the inexperienced that unless they know what factor of safety has been allowed in calculating standard tables serious errors are likely to arise. The book will be a most efficient means of initiating a student in the theory of beam construction.

It would often be interesting and instructive for architects' and engineers' assistants if they knew how their drawings of girders and columns were judged in the drawing-offices of manufacturers. The representations are useful for general dimensions, but in many cases they are not strictly followed in detail. A girder is, however, a comparatively simple object, and yet in the preparation of the drawings of one it is possible to make the cost of construction unnecessarily expensive. Manufacturers would often gladly supply the drawings without cost, and indeed those received have frequently to be, as it were, translated into a form which will be understood by foremen and workmen. Any draughtsman who has not had at least a short experience in

workshops should not attempt to prepare drawings until he has carefully studied Mr. FARNSWORTH'S volume.

He adopts economy as his guide, and he is not in sympathy with those who talk about making beautiful girders. Beauty, in his opinion, is "not a thing of patches, or holes, or curves only, but, according to our canons, of breadth of effect and disposition of form." He doubts whether railway passengers would pay a higher fare in order that the bridges over which they are carried might be more in keeping with the landscape. Steelwork he contends is engineering not architecture, and his idea of the chief duty of an engineer is to produce designs at the lowest possible cost. One of the first obstacles to economy he considers to be the ordinary specification. Let each of two engineers prepare one for the same set of drawings, and it is possible, he says, the prices will vary as much as 5% per ton. In America there are "manufacturers' standard specifications," which are generally adopted, and to them is owing in a large measure the fear we have of American competition. "The American has but certain fixed laws to follow, and his work must automatically become accepted; the Britisher has innumerable laws—for every job in his yard has a different set—and the added cost of clerical work and oversight alone must put him out of the race with his rival. Give the home maker the same or any other standard specification to work to, and a very different tale would soon be told." Another cause of expense arises from the time clause, for if the manufacturer has to accept the risk of heavy penalties he must discover some sort of compensation. As regards drawings, Mr. FARNSWORTH says that no sizes or dimensions ought ever be left to scale; figures should be placed everywhere, and every view should be dimensioned fully in order to obviate the hunt for a particular figure. The most common errors relate to rivetting, for rivets are often shown in positions where they could not be put in. The following advice is given:—

In commencing the drawing a faint rectangular outline of the girder should be first made, and on this the centre lines of all fixed points—centres of cross girders fishing in, and all connections—put in. Then must come the consideration of the stiffeners and rivetting pitch, and the aim must be to primarily obtain as regular a pitch as is possible. Generally the draughtsman seeks to place his stiffeners at mathematically correct centres apart. This is a mistake. There are few girders, especially those in buildings, of which the moving of a stiffener one or two inches either way would affect the looks. Certainly a symmetrical placing is pleasing to the eye, as also it fits in best (on evenly loaded girders) with theoretical requirements; but the eye cannot judge to an inch or two, and generally it is only this inch or two which is needed to give the rivets a regular pitch. It is a bad plan to place the stiffeners and then space the rivets between as best they will go. Perhaps at a given point a 4-inch pitch is desirable, and through this being done the pitch actually becomes $3\frac{3}{4}$ inches. Does the draughtsman ever think of the extra time required by the template-maker to set out a $3\frac{3}{4}$ -inch pitch over a 4-inch one? Somebody has to pay for that time, and it is not usually the maker. By slightly moving the stiffeners the 4-inch pitch might have been used, and the extra time and cost saved.

It is also an advantage for the designer to employ sizes and sections which are always likely to be found in stock. For instance, 4×4 inch angles can be delivered in a week, but $4\frac{1}{2} \times 4\frac{1}{2}$ inch might require from three to six weeks to be obtained. It is also economical to avoid insisting in trusses on diagonals fitting closely to the flanges. No harm would arise if there was a difference of a quarter-inch between them. Rounded ends for girders are wasteful. It is a very safe dogma, Mr. FARNSWORTH says, to beware of the fire. Any operation which depends on fire and heat is bound to be expensive, and is consequently to be avoided as much as possible. Rivet-holes are now preferred to be drilled, but it has no superiority over punching. "On some pettifogging span of 20 feet," says Mr. FARNS-

WORTH, "a British engineer will have a specification pages long, insisting, among other things, on 'all rivet-holes being drilled from the solid.' An American will make and confidently put up an Atbara bridge with a specification of only a few clauses, and no mention whatever of any method for making rivet-holes but punching." A kind of punching which the author condemns is that of piercing the webs of girders to obtain ornamental patterns; such work probably increases the cost by 5% or 6% per ton.

All we have referred to concerns the preparation of drawings in the office of the architect or civil engineer. The greater part of the book describes in detail the operations in the girder shops and smithies by which the steel structure is realised. Here Mr. FARNSWORTH shows himself a master, and the arrangements, which are all inspired by economy, are amply explained. For anyone who proposes to set up a business for constructional steelwork the author's conclusions will be found invaluable. There is no book which is so well adapted to serve as a guide under such circumstances. The two volumes by Mr. ATHERTON and Mr. FARNSWORTH, if taken together, reveal all the mysteries connected with the construction of steel girders.

THE SOCIETY OF ARCHITECTS.

THE twenty-first annual dinner of the Society of Architects was held on Friday evening last at De Keyser's Royal Hotel, Victoria Embankment, E.C., Mr. Walter W. Thomas, president, in the chair.

Among those present were:—Lord Stanley of Alderley, the Lord Mayor of Liverpool, Alderman Sir H. E. Knight, Sir R. Melvill Beachcroft (chairman of the Metropolitan Water Board), Mr. W. Watson Rutherford, M.P., Mr. C. McArthur, M.P., Sir J. Pulestone, the Very Rev. Canon Vere, Mr. L. A. Atherley-Jones, K.C., M.P., the Rev. Russell Wakefield, J.P. (mayor of St. Marylebone), Mr. A. Crisp (master of the Carpenters' Company), Mr. Austin Taylor, M.P., Alderman Fitzroy Doll (mayor of Holborn), Councillor Percy Gates (mayor of Kensington), Mr. F. Higgs (president of the London Master Builders' Association), Mr. B. Greenwood (president of the Institute of Builders), Mr. Cholton James (president of the Cardiff Society of Architects), Mr. James Jeffery, J.P., L.C.C. (mayor of Chelsea), Mr. W. E. Riley (superintending architect of the L.C.C.), the Mayors of Paddington, Greenwich, Finsbury, Deptford, Wandsworth, Lambeth, Hackney, Chatham, the Rev. A. Mercer, Dr. Lloyd Roberts, Colonel A. W. Holme, Major L. Whitehead, Major M. H. Hall, Messrs. G. Hubbard, Howard Colls, H. K. G. Bamber, H. Anderson, E. O. Sachs, A. W. S. Cross, J. R. Croger, G. A. Pridmore, G. Gard Pye (vice-president), A. A. H. Scott, C. Mason, S. C. Hanson, J. M. Frazer, L. F. C. Bell, H. Greville Montgomery, W. B. Bryan (chief engineer of the Metropolitan Water Board), J. R. Manning, R. de Burgh d'Arcy, H. Prosser, Alderman Viney, Alderman Skinner, Alderman Batchelor, G. E. Bond, T. Marcus Houghton, C. H. Rosher, W. Nightingale, R. Wellings Thomas, C. Day, W. B. Willmot, J. R. Featherby, W. Lees McClure, J. T. Wood, Owen Owen, C. W. Stevens, A. F. Fowler, B. R. Tucker, Philip Condry, Herbert Warren, F. Childe Warren, G. A. Child, H. C. W. Blyth, F. W. Macey, J. B. Corby, J. H. Champness, Anthony Scott, F. J. Byrne, A. Colman Scott, T. Falconer, S. Marsland, Ellis Marsland (hon. secretary), C. McArthur Butler (secretary), D. L. Fulton, C. Palmer, M. W. Tattershall, Walter C. Williams, E. J. Sadgrove, A. Burnell Burnell, A. Y. Mayell, Thos. R. Richards, A. A. Atkins, W. E. Wanmer, D. Morgan, T. J. Jones, A. E. Mullins, J. E. Burkmar, E. C. Beaumont, A. Paterson, R. A. Jack, C. Watkins, Herbert Knight, C. H. Mead, E. Carr, H. V. Milnes Emerson, G. H. Paine, C. L. Gibbs, M. Williams, W. D. Jenkins, A. P. Killik, A. T. Franklin, G. A. T. Middleton, H. H. Richardson, T. F. Tickner, W. Atkinson, R. Leighton, Adolph Curry, A. E. Pridmore (vice-president). After the loyal toasts the Rev. RUSSELL WAKEFIELD proposed "The Houses of Parliament."

Lord STANLEY OF ALDERLEY replied for the House of Lords.

Mr. C. MCARTHUR, M.P., in his response for the Commons said it was getting more difficult year by year

for Parliament to pass Acts because the House was overburdened by work, and it would be well if the House of Commons was relieved of much of the smaller legislation submitted to it. He was aware that the Society had a burning interest in Parliament, and he hoped their Bill for the registration of architects would have a short and successful voyage. It was a wise measure the Society had organised, since by registration there would be a guarantee that no one should use the honourable name of architect without being fully qualified.

Mr. W. WATSON RUTHERFORD, M.P., submitted the toast of "The London Local Authorities." He hoped it would be considered appropriate that he should propose the toast, because he was once Lord Mayor of Liverpool, and because that municipality was the largest in the kingdom. In alluding to his municipal experience, he said the evil effects of many of the present by-laws hampered architects. There was no doubt that at the present time architecture in England as regarded the greater and important buildings was distinctly improving, but as regarded the common dwelling-house there was deterioration. This he attributed to the by-laws in force in many districts which tended to bring about a uniformity that was squalid, a condition which was the greatest foe to art and to the advancement of comfort and convenience.

Alderman Sir H. KNIGHT responded for the City of London. Mr. J. JEFFERY, for the London County Council, said that body was desirous of giving architects all they desired. London was a more healthful place to live in than Brighton because the County Council had done their duty. He believed they would have true architecture, and was proud that the County Council was spending so much money in the improvement of the conditions of the Metropolis.

The Mayor of KENSINGTON spoke for the borough councils, and Sir R. M. BEACHCROFT replied for the London Water Board.

Mr. ATHERLEY-JONES, K.C., M.P., in proposing "The Society of Architects and Architecture," said the toast intimately concerned the Society assembled there that evening and the larger number of architects outside their membership, and, he might add, the British public. Reference had been made to the desirability of the devolution by Parliament of some of its vast labours. He cordially sympathised with the motive which inspired those remarks. Parliament really found a difficulty in passing useful legislation which in former years was successfully carried through by non-official or private members. The time of Parliament was monopolised by the Government in the promotion, not so much of useful and necessary measures, but of measures which tended to promote the interest of a political party. However useful a measure might be, and however desirable, it was impossible to carry it into law unless it was of a wholly uncontroversial character and unless it received the support of every member. He regretted to say that the measure he had the honour of introducing for the Society still lacked a place in the statute book. He was not insensible to the fact that they lacked co-operation in the promotion of that measure, and he regretted that the Institute of Architects had not supported it in securing a passage through Parliament. He believed the measure would be of inestimable value not only to the architects as a profession, but to the public at large. He hoped that at no very distant date the House of Commons would resume that control over public business which at present was assigned to a comparatively narrow section of the House, and that the small and useful measures which were desired by large sections of the community would receive attention, and which did more to contribute to the true welfare of the people than those measures which contributed to the rivalry of different parties.

The PRESIDENT, in his response, referred to the fact that they were celebrating the coming of age of the Society of Architects, and said he was glad to be in a position to congratulate the members upon the position which it had attained. They would like to know that during the past few months in particular the number of candidates for membership had been something like 50 per cent. in excess of previous years, and that both as regards finances and membership it was never in a better position to carry on the objects for which it was founded. The chief of these as they all knew was the question of the statutory education and registration of architects, with which the Society of Architects had been actively identified from the beginning—twenty-one years ago. It really seemed as though they

were on the eve of realising their object, seeing that, after strenuously opposing the matter for many years, the senior architectural institution, the R.I.B.A., was, it was understood, seriously considering the question of taking the lead in that important question. Indeed if their information was correct, a committee of the R.I.B.A. had the matter in hand, and were actually drafting a Bill on the subject for presentation to Parliament. As the members were aware, there was at the present time a Bill already before Parliament on the matter, promoted by the Society of Architects, and which was the outcome of many years' work. It had been carefully revised from time to time and was framed on thoroughly sound principles. Matters seemed therefore to have reached that stage when it was no longer a question as to whether the profession was in favour of registration or not—the Society of Architects settled that question by a poll of the profession, some years ago—but whether there should be two Bills before Parliament on the same subject, or whether there should be one Bill promoted by the senior institution and supported by the unanimous voice of the profession, including their Society. He would repeat what they had constantly said in public and in private, viz., that the Society of Architects was prepared to stand aside in favour of the Royal Institute, if that body was prepared either to adopt the present Bill or to substitute another one which should be of a character to satisfy the members of the Society of Architects that the principle which they had so long upheld should be adhered to. Their position was not the aggrandisement of the Society of Architects, but the promotion of a measure which should in some degree remedy the undeniable disadvantages under which the practice of architecture was at present pursued, affecting the public equally with the architect. What further proof of their *bona-fides* and sincerity could they give than to offer to forego the fruits of many years' work, and to let others reap where they had sown? The previous night they had had the pleasure of meeting two members of the R.I.B.A. and of discussing the matter with them, and they were hopeful that the discussion which took place would not be without good effect. They had carried their work to a certain point and were awaiting with interest to see what the R.I.B.A. proposed to do before they continued their active propaganda. The next move was with the Institute, and if they were in earnest in the matter it would be one which would enable them to approach Parliament with a united front. If, unfortunately, other counsels prevailed, the lead would be with the Society of Architects again, and they should not fail to take advantage of it. They were pledged to see the matter through, and were quite certain of success in the long run. In conclusion, he said they should like to see the profession a united body again, and if the Institute came to the front the Society of Architects would give them all the support they could, and he hoped they would go to Parliament shoulder to shoulder.

Mr. CHOLTON JAMES (president of the Cardiff Society of Architects) also replied to the toast, and said the architects in the provinces felt the need of registration more than those members of the profession practising in London. In the provinces they had to compete with men who had never served one hour even as articled pupils or as qualified assistants. It was in consequence of those untrained men that architecture in the provinces was deteriorating. There were large buildings erected, but Londoners competed and took the whole business. As many provincial men contributed to the Institute, they believed it only fair that they should have a voice in their counsels and seek registration, because without it they could only look forward in the future to increased competition from outside and unqualified men.

Councillor JOHN LEA (Lord Mayor of Liverpool) submitted the toast of "The Arts and Crafts Allied to Architecture," and assured them that Liverpool had done its full share in the promotion of architecture. Before London had awakened to the need for improvement Liverpool had to a large extent rebuilt its principal streets. Those men who followed the profession of architecture held a very high and honourable position among the people, and he was one who believed good building influenced the character of the nation and was an incentive to high morality.

Alderman FITZROY DOLL, who responded, said he earnestly desired that architects as a profession should be united. He believed it was owing to the want of unity among them that architects did not meet with the respect in England which such a great profession should command. There was a time when most architects had looked upon the builder and the craftsmen engaged on a job with the eye of

a policeman, believing it was the architect's duty to watch the interest of his client by being as severe as possible upon the builder. In the present time their sympathies were more with the builder and the craftsmen than they were before, because architects realised the difficulties the builder had to contend against. The lack of technical education among the English was deplorable, and in building work it meant that many of the details were supplied by foreign craftsmen.

Mr. A. E. PRIDMORE proposed "Our Guests." Mr. G. HUBBARD briefly responded.

REBUILDING THE QUADRANT, REGENT STREET.

THE Building Act committee of the London County Council report that they have considered an application by Mr. R. Norman Shaw, R.A., on behalf of Mr. J. F. F. Horner, a Commissioner of His Majesty's Woods and Forests, for consent to the rebuilding of the portion of Regent Street known as the Quadrant, and situated between Piccadilly Circus and Vigo Street on the south side, and Piccadilly Circus and Glasshouse Street on the north side, with the front portions of the upper floors of the new buildings carried over the entrances to Air Street on both sides of Regent Street. It is stated that the reason for desiring to carry the upper floors of the new buildings over the entrances to Air Street is to preserve unbroken the curved sweep of the upper cornice, and it is pointed out that the entrance to Swallow Street has always been similarly built over. Mr. Norman Shaw has expressed his willingness to make satisfactory provision on the second floor for the ventilation of Air Street, and also for that of Swallow Street, although the latter street does not come within the limits of his application. The committee think that the proposed rebuilding will effect a great improvement in the appearance of Regent Street, and in order that the Council may see what is proposed to be done, they have given instructions for the elevation submitted by Mr. Norman Shaw to be exhibited in the lobby of the Council chamber. It is recommended that the Council, in the exercise of its powers under sections 13 and 22 of the London Building Act 1894, but in no way otherwise than under such sections, do consent to the rebuilding of The Quadrant, Regent Street, with the front portions of the upper floors of the proposed buildings carried over the entrances to Air Street on either side of Regent Street, as shown on the plans (Registered No. S.A. 10,262) submitted with the application of Mr. R. Norman Shaw, R.A., on behalf of Mr. J. F. F. Horner, a Commissioner of His Majesty's Woods and Forests, such consent being subject to the following conditions—that satisfactory provision be made by means of an opening at the second-floor level in the buildings over Air Street, on both sides of Regent Street, for the ventilation of Air Street; that the buildings be commenced within twelve months and completed within two years from May 23, 1905; and that the buildings be otherwise erected and retained without any addition thereto and in exact accordance with the application for the consent and the plans and particulars which accompanied such application. That the applicant be informed that the above consent does not relieve the owners of the property from the necessity of obtaining any necessary consent from the local authority to the erection of buildings over the public way.

WOOTTON WAWEN.

THE antiquity of the church and the hospitality of the hall combined to make last Saturday's visit to Wootton Wawen, says the *Birmingham Post*, one of the most successful excursions in the history of the Birmingham Archaeological Society.

The carriages stopped at the fine old parish church of Wootton Wawen, where the Rev. F. T. Bramston (vicar) was waiting to welcome the archaeologists and to point out some of the interesting features of the building. Time did not permit of full justice being done to its historical and architectural treasures. Dating back to the period of the Saxon heptarchy, the church has passed through many vicissitudes, and each succeeding century has added something to the fabric. Some of the additions and alterations have seriously interfered with the symmetry of the structure, but they afford a rare opportunity of tracing the development of English architecture. The church contains

examples of Saxon, Norman, Early English and fourteenth and fifteenth-century work. The centre of interest is the Saxon tower with its four massive square pillars and remarkably small round arches. The original structure is almost surrounded by later additions. On the east side is a fourteenth-century chancel, and the south aisle has also been extended eastwards to form a chantry chapel. Here a stone slab marks the burial-place of William Somerville, the poet who wrote "The Chase." He lived in the neighbouring hamlet of Edstone during the latter half of the seventeenth century. The church also contains some fine monuments to the Smythes, Harewells and Carringtons of Wootton Wawen Hall.

Their historic mansion, which has recently been purchased by Mr. Capewell Hughes, a Birmingham manufacturer, is within a stone's throw of the church. The house is a very handsome and commodious one in the Italian style, and it stands upon an extensive and picturesque estate. Lord Francis Carrington rebuilt the hall in 1687. Tradition says that Sir Christopher Wren prepared the plans, and there is good reason for believing that Grinling Gibbons was responsible for the beautiful carving of the cornices. It is certain that Wren and Gibbons were concerned together in similar work at Arbury, and that Sir Christopher was living in Warwickshire when the building was commenced, though he did not buy Wroxall till 1713. The Wren family remained for 150 years at Wroxall, which is six miles above Wootton Wawen on the stream that flows past the hall into the river Alne.

The present owner of the hall has spent a great deal of money in restoring the fabric, renovating the interior and improving the estate. The house has been decorated and furnished in accordance with modern ideas of comfort, but with due regard to the historic associations of the hall. In planning the improvements Mr. Hughes has availed himself of the antiquarian knowledge and artistic skill of his friend and neighbour, Mr. W. J. Fieldhouse. There is striking evidence of Mr. Fieldhouse's ingenuity in the Italian pleasure-land that has been laid out in the walled garden. Here Mr. Hughes's collection of foreign and antique sculpture is displayed to advantage. When the creepers have covered the walls, the roses have entwined the rustic bowers, and water-lilies have grown in the ornamental pools, it will be difficult to imagine that this Arcadian retreat was not part of the original scheme. All over the estate one finds new work grafted on to the old in such a natural way that nothing but the newness of the stone is out of harmony with the setting, and that will soon wear off.

Mr. and Mrs. Capewell Hughes received their guests in the entrance hall, which has been used as a drawing-room for the last 100 years, but has now been restored to its original form and adorned with beautiful frescoes depicting scenes from Shakespeare's "Much Ado About Nothing," by Mr. F. W. Davis, a former student of the Birmingham School of Art. Under the able direction of Mr. John Humpries, the genial organiser of the Society's excursions, the party passed through the drawing-room, which is rich in tapestries, to the mezzotint galleries, where they had a glimpse of the study, in the oldest portion of the house, which contains several secret escapements. The house has been in Roman Catholic hands from the time of the Reformation, and there remains abundant evidence of its adaptation for concealing priests in time of persecution. Some of the hiding-places have recently been sealed up, but privileged visitors were allowed to peep into several secret passages and staircases in the thick main walls of the building. After admiring the oak panelling, carved with the Carrington crest, in the morning-room, the archaeologists ascended the staircase, at the top of which they noted the entrance to the priests' apartments. The powdering-room reminded them of the days when powdered wigs were the fashion, and the private chapel recalled the story of Father Bishop, who is supposed to have been hidden there for several years. Descending to the kitchens, the experts pointed out traces of another chapel. Below this they came to the old well, the crypt cellar and the subterranean passage, which is said to branch into two, one outlet being near the church and the other in the village. It is a well-preserved brick tunnel, but is flooded with rain-water. This fact induced the sceptic of the party to suggest that the tunnel was not made for an escape, but for a drain.

Passing through the billiard-room, the visitors saw the minstrel gallery, and in the dining-room they noticed the frames of family pews, indicating that this room was used as a private chapel 100 years ago. Up to the time when Mr. Hughes acquired the estate the Roman Catholics of the

district worshipped in the adjoining chapel, which is now called the music-room. By the generosity of the past and present owners of the hall, the local priest has been provided with a new church not far away.

Tea was served in the music-room, which is worthy to be ranked among the works of Wren. Before partaking of the delicacies provided by Mrs. Hughes, the company listened to a short address by Sir Benjamin Stone. The member for East Birmingham referred to the hall as one of the most interesting country seats in Warwickshire, and congratulated Mr. and Mrs. Hughes on the way in which they had restored their historic and beautiful mansion. The history of the hall was, he said, intimately associated with that of the parish church, and the ruined priory that could still be traced on the estate. Probably both ecclesiastical buildings grew out of a hermit's cell established by a missionary from one of the older monasteries on the Continent. The history of the priory could be traced back to the year 850, when it received a grant from Ethelbald, king of Mercia. After referring to the civil and religious disturbances that had left their mark on Wootton Wawen, Sir Benjamin spoke of Edward Arden as a connecting link between the family of Somerville and that of Shakespeare. He suggested that the tragic death of John Somerville, after his mad threat against the life of Queen Elizabeth, might have had something to do with Shakespeare's departure for London, which occurred about the same time.

Mr. J. A. Cossins (president of the Society) expressed the hearty thanks of the company to their host and hostess. He also referred to the fact that the excursion was the hundredth in the annals of the Society, and the first of the present season. The attendance was more than twice as large as usual.

Mr. Hughes, responding, referred to the evidences of Shakespeare's fondness for the Forest of Arden.

LONDON COUNTY COUNCIL SCHOOL OF BUILDING.

THE education committee of the London County Council have made inquiries as to the causes of the poor attendance at the classes in architecture at the school of building. When the school was established by the late Technical Education Board it was recognised that it would be necessary at an early date to appoint some well-known authority on architecture to act as director of the architecture instruction at the school, and to give courses of lectures on architectural subjects. Inquiries have been made with the object of finding some well-known authorities who would be prepared to undertake work of this kind. Of the gentlemen interviewed, Professor Beresford Pite, F.R.I.B.A., professor of architecture at the Royal College of Art, South Kensington, appears to be the most suitable candidate. He is prepared to give courses of lectures and direct the architectural work of the school for a fee of 300*l.* a session, which would include attendance at the school for three evenings a week. The lectures would deal with architecture as a building art with the purpose of practically illustrating the essential relation between building craftsmanship and architectural progress. Ancient architecture would be dealt with, Greek, Roman and Renaissance buildings being brought under review, not merely in historical sequence, but as practical illustrations of problems in design and construction. In connection with the work of the building craft classes, supervision and advice would be given to impart architectural character and usefulness to the work of the classes for drawing, stone and wood carving, decoration and decorative plastering. Assistance would also be given in arranging the several building craft classes into a complete course of architectural education. The education committee recommend that a director of architectural instruction and lecturer on architectural subjects be appointed at the London County Council school of building at a fee of 300*l.* a session, and that the appointment do include attendance at the school on three evenings a week.

The Executive Committee of the Bradford Exhibition have received a balance-sheet showing profits of nearly 15,000*l.* It was decided to hand over 5,000*l.* to the Corporation for disposal as thought fit, and about 10,000*l.* to the libraries committee for the purchase of pictures. The visitors to the exhibition numbered over two millions.

NOTES AND COMMENTS.

It is satisfactory to find that Mr. HOLMAN HUNT, although he has nearly reached his eightieth year, can still use his pencil like a master. In Messrs. TOOTH'S Gallery can now be seen his *Lady of Shalott*. No one will complain that he has treated the subject as far back as 1857, for the woodcut in Moxon's "Tennyson" corresponds in a large measure with the painting. The poem which TENNYSON published in 1832 was inspired by an Arthurian legend, and the most difficult of all the passages was selected by Mr. HOLMAN HUNT. The girl who afterwards was to figure as ELAINE, the lily-maid of Astolat, in numerous English paintings, is entangled in the threads of the magic web which she had been weaving night and day. In the painting as in the engraving she has seen LAUNCELOT riding down to Camelot, and she turns her eyes from the mirror. Her long hair appears to be under the same influence as the web, and seems as if about to envelop her. In the woodcut she is shown dressed in white, but in the painting her dress might be made of peacock feathers with a pink and white skirt. On the wall, instead of a painting of the Crucifixion, there is one of the MADONNA and HERCULES in the garden of the Hesperides. Mr. HOLMAN HUNT has been faithful amidst the faithless, and the *Lady of Shalott* is a resurrection of pre-Raphaelitism with its brilliant colouring and mysticism.

It appears that at the present time the members of the education committee for Kent transact the greater part of their business in London, which, as they have work of their own, is found to be convenient. But other members consider that Maidstone should have all the offices of the County Council. It was agreed at the annual meeting held last week to appoint a committee to consider the relative advantages of London, Maidstone, or elsewhere, and that such committee be empowered to spend such sum as may be necessary to obtain a report on the proposed site and plans for the building, and an estimate of the cost of erecting and equipping such building, and of the cost to be incurred in repaying a loan to meet such cost. Another proposition which was made at the same meeting by Lord HARRIS indicates the tendency of the time to consider county work as belonging to engineers alone, although some of the cases referred to were distinctly architectural. For instance, it was said that the public works business of the Education Department was in the hands of laymen who were without professional advice. If that is the case it is unwise, but the best remedy for it would be consultation with an architect. According to Lord HARRIS, the lunatic asylums were under one engineer, the police buildings under another. He therefore proposed, "That it be referred to a committee consisting of the chairmen of committees to consider and report whether or not it would be advantageous to the county to engage the services of a chief or consulting engineer." The Council, however, considered it was not prudent to increase the number of officials, and the motion was therefore rejected.

At a meeting of the Birmingham Corporation on Tuesday, Alderman KENDRICK, in presenting the report of the museums and art gallery committee, was able to announce that for fourteen successive years the municipal art school occupied the first place in the national competition. South Kensington must respect so promising an auxiliary, and in fact the authorities have yielded to the representations from Birmingham by admitting that craftsmanship or executed design should be eligible for awards instead of the drawing merely, as formerly insisted upon. The principal competitor against Birmingham used to be Glasgow. But that

school is now in the happy position of being independent of Government assistance or supervision, and can follow an independent course. Many towns in England must desire that they could follow the Glasgow example. It is necessary, however, to have liberal supporters, and they are not everywhere to be found.

ILLUSTRATIONS.

LANGWITH LODGE, NOTTS.

THIS house, situated about midway between Mansfield and Worksop, not far from Welbeck, has been built as a residence for the Duke of PORTLAND'S agent, on the site of an old house of no architectural interest, very inconveniently arranged and somewhat dilapidated. The position of the former building decided that of the present one, with its aspect due south and the domestic offices on the north and west sides, the new house occupying less space than the old one, but providing considerably more accommodation, being much more compact. The arrangement of the ground floor will be seen on the plan, and there are large cellars. On the first floor are five bedrooms, three dressing-rooms, day nursery, schoolroom, linen-room and bath-rooms, &c., and on the second floor eight bedrooms, box-rooms and bath-room, &c. The house is faced with red bricks of a quiet colour, with Anston stone dressings and green Buttermere slates, the wood-work being painted white. The staircase and principal doors on the ground floor are mahogany, and the floors of narrow pitch-pine boards with "pavodilos" joints. The walls of the hall, staircase and drawing-room are panelled, and the rooms have ornamental plaster ceilings by Messrs. GARVIE & SONS. The walls of the kitchen, lavatories and bath-rooms, &c., are lined with blue and white Dutch tiles by Messrs. M. VAN STRAATEN & Co., and those of the scullery and larder, &c., with white tiles. The house is lighted by acetylene gas, and partly heated by water on the low-pressure system. "Rational" grates are used throughout, and the chimney-pieces are of eighteenth-century style. The furniture is chiefly old, of the Chippendale and Sheraton periods. Mr. EASTWOOD, of Warsop, Notts, was the builder, Mr. HELLIS the clerk of works, and Mr. LOUIS AMBLER, F.R.I.B.A., of London, the architect.

THE RESTORATION OF MARK CHURCH, SOMERSET.—VIEW LOOKING N.W.—INTERIOR, LOOKING S.E.

NO. 1 COURT, COUNTY SESSIONS HOUSE, PRESTON.

A HOUSE AT SIDCUP.

WE give this week an exterior view of this house. Mr. F. T. W. GOLDSMITH, A.R.I.B.A., of London, is the architect. The drawing was exhibited at the recent Building Trades Exhibition held at the Agricultural Hall. The ground-floor accommodation is indicated by the plan, and has been slightly varied as regards the hall and staircase, which is all in oak. Local red bricks interspersed with black headers have been used for the elevations and Aylesford tiles for the wall-hangings and roofs. The work has been carried out by Mr. T. M. BRIGHTLING, builder, Sidcup.

THE whole of the beautiful marble and mosaic work which has been carried out in connection with Indemnity House, 1 Old Broad Street, London, E.C., and which was illustrated in our last week's issue, was entrusted to the Art Pavements and Decorations, Ltd., and was prepared at their new works, St. Paul's Crescent, Camden Town, N.W.

THE ARCHITECTURAL ASSOCIATION.

THE members' annual dinner of the Association was held on Thursday evening the 18th inst. at the Criterion Restaurant. Mr. E. Guy Dawber, president, took the chair.

There was a good muster of members and friends, and the evening proved a great success. Among those present were:—Messrs. H. L. Florence, H. T. Hare, Leonard Stokes, John Murray, J. S. Gibson, Louis Ambler, Maurice B. Adams, H. Stannus, Cole A. Adams, J. D. Crace, F. Hooper, W. J. Locke, H. P. G. Maule, Leslie W. Green, A. N. Prentice, H. Tanner, G. B. Bulmer, E. A. Rickards, A. Keen, J. MacLaren Ross, G. Northover, W. G. B. Lewis, P. L. Forbes, A. H. Belcher, H. H. Robinson, S. L. Crosbie, G. Leaning, C. W. Beaumont, N. Forsyth, W. A. Pite, G. H. Jenkins, J. B. Fulton, A. Campbell, F. G. Christmas, T. L. Dale, R. A. Jack, S. J. Tatchell, W. S. Dakers, Gilbert H. Lovegrove, H. R. G. S. Smallman, G. L. Elkington, H. B. Elkington, F. G. Newton, G. Drysdale, W. I. Travers, G. F. B. Daniell, Maurice E. Webb, F. R. Taylor, Alan Potter, C. L. Hampton, D. M. Wilson, V. C. Batalha-Reis, P. Tilden, J. Heron Watson, R. F. Wheatly, G. F. Webb, J. W. Denington, T. Frank Green, E. Gunn, C. R. Davy, W. Kerr, W. G. Green, B. H. Colcutt, F. H. Atkinson, R. Frank Atkinson, R. S. Balfour, T. O. Foster, A. N. Campbell, H. C. Ingram, Cecil G. Hare, A. O. Collard, Max Clarke, E. J. Gosling, C. H. Freeman, J. C. Tanner, E. Harding Payne, G. M. Nicholson, G. J. Morriss, Percy French, Walter Cave, F. T. W. Goldsmith, F. J. Potter, R. Harry Hale, R. Dircks, R. H. Weymouth, Stanley Towse, W. Paul, J. A. Rogers, H. G. Turner, C. E. Varndell, P. J. Westwood, W. A. S. Pettit, A. Cyril Caudwell, R. H. Dods, W. A. Webb, H. Gregory Collins, Alfred Cox, F. Dare Clapham, T. C. Yates, A. E. Munby, C. McJarrow, H. J. Worrow, L. J. Spragge, H. C. Willies, Frank Yerbury, H. L. Samson, J. H. Squire, H. M. Wakley, and D. G. Driver, secretary.

The first toast, "The King, Queen and Royal Family," having been loyally passed, the PRESIDENT proposed "The Royal Institute of British Architects." He regretted they had not the President of the Institute with them, but they had in his place one of its vice-presidents and an old member of the Association. The Institute was rather the parent of that body, and many members of the Association eventually joined the ranks of the Institute. Kindness had always been shown to them by the Institute, and for years past they had given an annual grant of 100l. towards their work. They had also very generously aided them in the Building Fund. The assistance, too, that all students received from officers of the Institute was most gratifying, and it gave him great pleasure to submit the toast.

Mr. H. T. HARE, in response, said the regret their Chairman had expressed for the absence of the President of the Institute was mutual, because he was sure the reply to the toast would have been better coming from the President than from one of the vice-presidents. As had been remarked, the Institute was very closely connected with the Association, regarding with the greatest sympathy all its work, and wishing to give it every support in the schemes for education. The ranks of the Institute had been, and he supposed they always would be, recruited from the Association and the Institute must look to it for members in the future. It would be the wrong time and place to introduce any question of politics, but, as they all knew, there was at the present time a considerable difference of opinion on certain questions concerning the profession, and it was doubtful whether those who held office in the Institute would be able to retain their positions. Still, whatever might be the outcome of the controversy, the members of the Association could regard it with the greatest equanimity. Every member of the Association was an educational enthusiast, and whatever qualifications might be imposed upon architects in the future in order to permit them to practice as such, they would not be felt by members of the Association. The movement would only be conducted against those unworthy members of the profession who did not wish to study, and it could not, therefore, affect trained men. In conclusion, he thanked them for the kind way in which the toast had been proposed and received.

The PRESIDENT, submitting the toast of the "Architectural Association," said it was altogether out of order for him to do so. He was sure that no words on his part were needed to commend the toast to them. The presence of such an assembly proved the interest they took in the work of the Association. During the last two years they had embarked upon two large undertakings. They had removed from their old premises to new ones in Tufton Street, and they had

established on a very firm footing their day school. Those two undertakings, which had been successful far beyond their wildest dreams, had not been done without a monetary outlay, and it was only within the last few weeks they had been able to find out how much those undertakings had cost them up to date. The actual cost and including legal expenses had been 10,211l. An enormous sum. A year ago they had collected a sum of 6,420l., leaving practically, when he came into office, 3,790l. to be collected. They would, perhaps, remember that a very generous friend at the beginning of the session made an offer to them of 1,000l. provided that the debt was wiped off by the end of the session. He was sorry to say they had not been able to wipe off the debt, but, notwithstanding that, he had had a letter handed to him in which, while expressing disappointment that the liabilities had not been paid off, their generous friend had decided to convert the offer into a gift. (Applause, and cries of "Name.") He was not at present permitted to divulge the name of their friend, but he thought the whole Association thanked the generous donor very deeply. The debt, therefore, was reduced to 2,790l., and since submitting the report in October last they had collected a sum of 1,631l., leaving a debt at the present time of 1,134l. When they came to think of it, he felt that was a record to be proud of. He did not like making appeals, and he was sure they must be perfectly sick of the sight of the letters that they had received. He felt, however, that the Association was indebted to the architectural profession for helping them to clear off that debt, and he should like to say that if those members who had not contributed anything would send only one guinea, the secretary had informed him that they might start the next season without debt. The Association had, as they knew, done a work that he felt they were all proud of without public or official recognition. They had established themselves firmly, and with a school that he felt was going to do a large amount of work in the future. On the other hand, he felt there was a slight rift in the lute, and he believed that in their anxiety to clear off the debt and put the educational scheme on a sound foundation they had rather forgotten the primary object of the Association, which he took it was the good fellowship and social life which should be cultivated among its members. They did not want the members to feel that 18 Tufton Street was a cramming establishment. They did not want people to think that education was the be-all and end-all. They wanted them to feel that the Association was an aid to the social side of their work, because he thought they would find in after life that the greatest friends were those of their youth. Yet if as members of the Association they held aloof from one another, and did not share in keeping it in the position it had gained, the work they had done in the past would be nullified. He would suggest that during the next year of office they should try to get up some social evenings and try and mix more than they had. For instance, during one evening in the autumn they might have an "At home," at which the sketches members had made during the holidays would be hung up and freely criticised. Another evening might be given over to the students to ventilate their grievances. There was another thing which he felt they ought to do. They ought to make their premises more attractive as a club. The state of the common room, with the few very hard chairs and just one or two professional building papers, was not likely to attract the student. He suggested that they should subscribe to all the foreign and American professional papers, and that they should take in all the papers that had any bearing upon their profession. The catering too would be improved. He asked members to remember that they had only been in their premises for one year, and it was difficult to get the building and arrangements into perfect working order in such a short space of time. He would like also to see more members join generally in the discussions at their meetings. He felt the Association had had a very magnificent past, and it rested with them to see that it had an equally magnificent future. If they looked round amongst the leading architects they would find, without exception, that the men who were doing the really brilliant work had either been or were members of the Association, and it was a fact they ought all to be proud of.

Mr. W. CAVE, in response, said it was a matter of congratulation that Mr. Dawber had accepted the presidency for the coming year. Mr. Dawber had dealt with the social side of the Architectural Association, and he thought there was another side which was perhaps of secondary importance, and that was the educational. He believed that the work the school was carrying out was some of the very best

done among the younger men of the day, and that they would look back to the foundation of the architectural teaching system as being one of the best arrangements the modern course of instruction could provide, and it was a matter which the Association might congratulate itself upon. The importance of a thorough grounding to students before they entered an office was of the greatest value to them, and anyone who had had to do with pupils would know that the system of scientific teaching was the proper training for architects. He thought the virility and enthusiasm of the Association was really remarkable in a body that was composed of 1,600 members. There was no place in the whole world where so much architectural work was going on as in London. It was practically being rebuilt, and there was a chance for every member of the profession to show his ability.

Mr. A. O. COLLARD submitted the toast of "The Visitors." Mr. P. L. FORBES briefly responded.

The PRESIDENT, in proposing the last toast, "The Health of their good Secretary, Mr. Driver," said no one took a deeper interest in the Association, and no one had done more to further the educational work they had organised.

Mr. DRIVER returned thanks.

During the interval between the speeches Mr. Percy French gave a refined and inimitable entertainment entitled "Chuckles in Chalk."

THE MONUMENTAL TREATMENT OF BRONZE.

SEVENTEEN years ago I had the honour of addressing this Society on the subject of "The Monumental Uses of Bronze." I then confined myself to illustrations of sepulchral monuments. Not many weeks since my friend Mr. Marion H. Spielmann also read here a paper on royal monuments, describing those erected and in process of erection to the memory of our great Queen Victoria and her mighty contemporaries, the Emperor William and King Victor Emanuel, all three builders of empires. There remains, however, a vast field to which not one but many meetings of this Society might be usefully devoted. Commemorative monuments, indeed, may be classified into five great groups—religious, sepulchral, allegorical, historical, iconographic—each a subject for separate treatment.

Those designed to honour divinities, lest unseen their awful power should be forgotten, are the earliest of which we have any knowledge. These were visible symbols if not actual habitations of the gods, or temples set apart for their cult. Later, temples were erected with more mixed motives, but always with the dominant, if unexpressed, idea of bettering the life to come. Associated with religious beliefs, they took the practical form of providing places of worship for the people and domiciles for the priesthood. The few other religious monuments, as fountains dedicated to the Virgin, or isolated statues of saints, are exceptions of slight importance.

Another group marks the burial-place and perpetuates the memory of illustrious dead. These sepulchral monuments assumed at times vast proportions, like the Pyramids, the Mausoleum, the Castle of St. Angelo, the Taj Mahal, the Medici Chapel, the cenotaph of Maximilian and the chapel of Henry VII. Like the Wellington monument in St. Paul's, and the Royal Mausoleum at Windsor, they denote the actual places of interment.

Another more fanciful and poetic group consists of impersonations of the forces of Nature, of the Attributes, Passions, the Past and the Future, as well as concrete things, such as rivers and people, by means of symbolic or allegorical imagery. The Greeks and Romans delighted in these, and they continue to appeal to the multitude even at the present day. With us no symbols are more popular than Britannia, the British Lion and John Bull. The series of seated statues of the cities of France around the Place de la Concorde in Paris, erected with no such motive, serve in no small degree to keep green the memory of the losses of the Franco-German war.

An equally imaginative group is the Historical, commemorating auspicious or important national events. These are for the most part set up in public places and take varied forms, the most usual being arches, columns, obelisks, cairns and allegoric statuary. These monuments, so important among nations of antiquity, had fallen into disuse in Europe until revived by Charles V. and Louis XIV. The

Columns of July and Napoleon, our own Monument, the Arcs de Triomphe and du Carrousel and the Portes St. Denis and St. Martin are conspicuous examples.

The last and by far the most numerous group is Iconographic, or erected to commemorate the deeds, virtues and appearance of famous personages. These were equally familiar in ancient Greece and Rome, but forgotten later until the Classic revival in the Italian Renaissance led to the production of monuments resembling those of antiquity. Our Nelson and the Duke of York columns and Alber Memorial are familiar examples, but such memorials more commonly take the less ambitious form of simple portrait statues.

We in England have shown little interest hitherto in monuments commemorating past events, however important, and few are of historic value unless sepulchral. The commemoration of our monarchs and greatest men in bronze or marble was never a national concern until late in the seventeenth century. The men themselves, or their immediate heirs, erected the monuments that exist, as well as countless others that have perished through fire and decay. Had the customs of Greece or Rome by good fortune been maintained, statues would have been set up to most popular heroes of the day, and the likenesses of hosts of interesting personalities preserved and now be familiar to us.

Setting aside sepulchral monuments, with which I do not propose to deal, the most ancient and the most touching is the series of stone crosses erected to mark the resting-places of the bier of the beloved Queen Eleanor, of whom we have fortunately a splendid portrait in bronze in Westminster Abbey. For the most part the crosses have long since crumbled away and been removed, but one especially is perpetuated for ever in the name "Charing Cross." The sentiment that dictated the erection of these and its mode of expression have remained unique. A long interval elapsed before any other commemorative monument was set up in London, and then it needed nothing less than the appalling destruction of the entire City proper, with all its churches and historic buildings, to awake in the English mind a sentiment that had been so predominant in ancient Greece and Rome. "The Monument," so called because there was no other, remains practically unique in England, and except in the naming of Waterloo Bridge and Trafalgar Square there is no visible sign that the nation cares to perpetuate the great events which have built up its history. But for the Guards Monument there is nothing publicly commemorating the Crimean war; there is no sign of any national monument in remembrance of our struggles for supremacy in South Africa; and even the arrival of "Cleopatra's Needle" failed to make us realise that in it we possess the most fitting memorial of our occupation of Egypt. Monuments of stirring national events should provide history written large and artistic object-lessons for the people. To ancient historic monuments we are indebted for our sole accurate knowledge of the actual arms and appearance of such mighty historic nations as the Egyptians, Assyrians, Medes, Persians, Dacians, Scythians, Greeks, Romans, Gauls, indeed of every nation that has made up the world's history. A Roman triumphal arch affords the only actual representation of the mystic seven-branched candelabrum of the Jewish Temple, while Trajan's column presents a minutely accurate representation of the chain-mail and weapons that proved as fatal to Crassus as to the English at Hastings a thousand years later. Our neighbours across the channel show a thorough appreciation of the value of grand commemorative monuments. The columns of July and Napoleon, their triumphal arches, the Trocadéro, the bridges and names of streets and places keep alive the national glories and chequered career of the great nation. Already most of these monuments are mellowing into historic value, just as in time to come even our indifferent Guards Monument will serve not only to preserve the memory of our first great struggle with our northern enemy, but will record the exact costume of those who fought the battles. How valuable contemporary monuments in bronze would be to us of the heroes and rank and file who won our historic victories. Our pride in our Empire should surely induce us to hand down the presentment of those of us who fight our country's battles, and also of their gallant foes, whether Zulus, Afghans or others. With no very earnest or successful antiquaries among our living sculptors, it is perhaps unwise to attempt to construct monuments commemorating anything but the immediate past and present, for certainly Boadicea, in her scythed chariot, and the warrior waving a sword in Palace

A paper by Mr. J. Starkie Gardner, F.S.A., read before the Applied Art Section of the Society of Arts on May 2.

Yard, with bronze bas-reliefs on the pedestals, do not appeal to us as historically accurate; but the great events of our own day, the union of the British Isles, the federation of the Colonies, and the consolidation of our Indian Empire, our political freedom and that of the Press, might be treated seriously if competitions were open to all British subjects. An Alfred Stevens may exist among us, or some scenic artist or poetic dreamer might give birth to ideas for the professional architect and sculptor to realise. My own experience is that the power to design and the power to execute do not necessarily or invariably occupy one cranium. The dearth of reasonable presentments of our historic worthies in the public spaces of our Metropolis has only been lessened of late by the portrait in bronze of Cromwell, and the Achilles in Hyde Park still remains our only symbolic statue against the scores set up in other capitals.

Contrasted with those of Paris, our monumental efforts appear insignificant indeed. Emerging a few days since from the Louvre on to the Place du Carrousel, I was at once faced by a series of superb monuments, including that to Gambetta. A few steps west led by the triumphal arch, with its bronze quadriga, to the Tuileries gardens, where I was confronted with a galaxy of statues and groups, comprising two fine groups of lions and rhinoceros and tigers in bronze. Continuing to the Place de la Concorde I found myself in the presence of the great Luxor Obelisk and two splendid fountains, around which are placed in solemn dignity the great statues emblematic of the noblest cities of France. Beyond, again, are other monuments, including the Marly Horses, the vista being closed by the great Arc de l'Etoile. Grand monuments meet the eye in every part of Paris, and, unlike ours, are effectively placed, and appear to be purposely designed to occupy the positions in which they are seen, frequently amidst trees and flowers. Our monuments, on the contrary, are generally designed before any position is allotted to them.

In our vast Metropolis—laid out for the most part to accommodate the high number of inhabitants by the great landowners, who parcel out the largest part of its area—there are fewer magnificent sites for monuments than in cities laid out by monarchs or powerful corporations. Most of the open places of London are enclosed squares and gardens closed to the public, each of which in Paris would be laid out with palms, plantains and flowers, and seats around some central fountain or artistic monument. At some not far distant time the happiness of the many may be regarded as more worthy and pleasing than the solitudes of which so few make use. Meanwhile several fine sites for monuments are available. A new and splendid façade to the National Gallery, with loggias and statues, and Trafalgar Square remodelled as a broad approach to it, could commemorate the federation of the Empire. Parliament Square, with its majestic surroundings, would also provide a matchless site for a noble commemorative monument. There are other less important sites, though it is unfortunate that the few commanding spaces at the intersections of main thoroughfares, created by our municipal councils, fit for the reception of beautiful objects, have been seized upon by the sanitary department for underground conveniences which a refined taste would have gladly relegated to equally accessible but less prominent situations.

It must be quite obvious that monuments that tell in London are not the ordinary portrait statues in garments which do not lend themselves to artistic treatment, and on which so many thousands of pounds have been expended without adding one touch of beauty to the town. Monuments to be telling in London must either comprise more than a single figure or be of larger size than the heroic size sanctioned by tradition, or, best of all, be equestrian. A rider on his steed assumes a dignity of pose embodying mastery of an animal many times more powerful than himself, which is most gratifying to humanity. Monuments might assume grander proportions were kindred spirits to be commemorated, associated in groups, or as parts of a whole. Britannia and some of her statesmen might symbolise the union of the British Isles; Neptune, with seamen and navigators, our vast maritime power; Victory and warriors a victorious reign. Allegories of Commerce, Science, Peace, Prosperity, Wealth, Fortitude, Charity, Justice, Mercy, Truth, are all capable of artistic treatment, and would elevate the thoughts of the gazer and passer-by, which I take to be the chief reason for setting up monuments, which are not erected merely for pomp and vain glory. Such might take the form of groups, or combine

with columns, triumphal arches, fountains or bridges—which will perhaps provide the most important sites we are likely to acquire in the near future under existing régimes. Mediæval bridges with their defensive gates, chapels and figures of guardian saints, were picturesque objects. In the cases of Blackfriars and Westminster, we have realised the difficulty of decorating bridges not designed for the purpose of receiving statuary; while visitors to the Paris Exhibition realised on the other hand the surprising possibilities afforded by bridges when designed to be commemorative. Instead of the commonplace pannier-like widening of London Bridge, it might have been converted into a glorious monument to the British navy; while the new bridge at Vauxhall might have been fitly made to commemorate the services of the Household Brigade in Egypt and South Africa, the purely utilitarian expenses being defrayed as heretofore, and the monumental features by subscription.

I fear I have trespassed on your time by this discursive preface. But the loss, all too recent, of a beloved and one of the greatest monarchs of our history, and the losses incidental to the far-reaching struggle in South Africa, have turned the thoughts of all towards the subject of memorials. The spirit of Empire too, seems in the air, beginning to stir the pulse of the nation, and perhaps ideas now sown may, like grains of mustard, produce large results in the future.

I shall now proceed to exhibit a very few examples of monuments of the past, limiting them to those of bronze which, in our climate, is the only material suitable for sculpture exposed to the elements. In the short time at our disposal these must obviously be limited to one or two minor groups. Objections and difficulties notwithstanding, it is unlikely that committees who manage these things will set aside the full-length portrait statue. We have no recognised embodiments of the powers of nature, like the Greeks had—Zeus, Athena or Apollo—to represent and idealise, neither do we commemorate victorious athletes in the nude, nor is the general attitude of the populace encouraging as yet. In ancient times it was one of eager expectancy, and general acclaim rewarded the sculptor when one of his triumphs was set up. This was so in the halcyon days of Greece, Rome, Italy, and it is still seen, to some extent, in France, as we saw at Bordeaux a few days since, when the unveiling of the Gambetta monument amounted to a national fête. Even Germany and other countries contrast favourably with the utter apathy of the English, who seem collectively to have lost touch with everything truly artistic. Added to this is the difficulty of modern costume, which proves an almost insurmountable and always distressing problem to the modern sculptor. If those he habitually commemorated were champion swimmers, oarsmen, football or tennis men, the matter would be otherwise; but, unhappily for art, those deserving of statues are great statesmen, like Joseph Chamberlain, scientists, benefactors and so on, and the costume in which we know them best, the tall hat and eyeglass, the immaculate frock-coat and well-stretched trousers, the starched waistcoat and stiff collar, must make artists despair, however well-knit and alert the original may actually be. Only the few can be portrayed in majestic draperies, like kings and German emperors.

With animals the sculptor is on safe ground; they present their natural grace and beauty unspoiled by art. The most venerable bronze in existence, still resisting the ravages not of centuries, but of millenniums, and yet retaining its ancient position in the hippodrome at Constantinople, where it was set up as a trophy when Christianity was in infancy, is the ancient Pythian tripod from the temple at Delphi. It is formed of intertwining snakes, now headless, and the monument is now sunk in a deep pit, a witness to the change in the level of the ground brought about during the centuries it has stood erect at Constantinople.

Once in near association with this and no less venerable are the four bronze horses of St. Mark's, removed from the hippodrome by Doge Dandolo in 1204. They originated in Greece, probably in the fifth century B.C., and after adorning several triumphal arches in Rome were transferred by Constantine to his new capital, whence they found their way to their present position over the porch of St. Mark's Cathedral in Venice. They formed part of a quadriga and were formerly gilt, and are said to be of pure copper cast extremely thin, hardly one-sixth of an inch in thickness, and are thus triumphs of the founder's skill, unless they are hammered work. The head and neck were cast separately, the junction being hidden by the collar. Parts of the horses, being ungilt, show where the

trappings formerly existed, and there are holes for their attachment. Their frequent removals have caused injuries to the lower parts of the legs, and some of the gilt trappings and ornaments disappeared after the French had taken them to Paris and been compelled to restore them. The bodies are round, the necks short and muscular, and the heads superb. A bronze horse of the same date, but mutilated, is in the Conservatorio at Rome. The third illustration is also of venerable antiquity and by far the most ancient bronze equestrian portrait statue in existence. It stands in the Piazza del Campidoglio at Rome, and was placed on its present pedestal by Michel Angelo in 1538. The figure is that of Marcus Aurelius, bareheaded and in simple drapery, seated in an easy attitude upon a saddle cloth or saddle of singular construction.

There is a long interval between this and the next equestrian statue, which is said to be of iron and not bronze. This is the St. George and Dragon in the cathedral square at Prague, made by Martin and George Clussenbach in 1373, and shows armour partly scaled and partly of plate. It was partially restored in 1562. There is a cast of it in the Victoria and Albert Museum.

There is mention of a cast of an equestrian statue of St. George being in England in the time of Richard II.

Equestrian statues were produced in Italy during the Renaissance, the earliest being that of Gattamelata, by Donatello, in the piazza in front of the great church at Padua. This celebrated commander of the Venetian army in 1438 is in the armour of the period, truncheon in hand. He is bareheaded, with curly hair and a slight beard. An enormous cross-hilted sword is slung at his side, and he wears the long rowelled spurs of the fifteenth century. The horse is short-necked and extremely powerful, the tail being twisted into a knot.

An even finer statue is that of Bartolomeo Colleoni, another captain-general of the Venetian forces, who died in 1475, and was one of the first to use field cannon in war. He is sheathed in richly decorated armour and wears the Venetian salade and short rowelled spurs. The horse, like that by Donatello, resembles those of St. Mark's, but with more vigorous action. The saddle is high, back and front, and richly decorated like the harness; the feet are in stirrups. The statue stands in front of the church of SS. Giovanni e Paolo, in Venice. It was modelled by Andrea Verrocchio, who, however, died in 1488, leaving it to be cast by Alessandro Leopardi, who completed it in 1496. This is probably the finest equestrian statue in existence; the pose is superb, and horse and rider present an irresistible force.

Passing over the French equestrian portrait statues, most of which were destroyed in the Revolution, we come to those of our own country. The only one still remaining of the seventeenth century is that of Charles I. at Charing Cross, by Hubert le Sueur, a French pupil of John of Bologna. It was cast in London in 1633, at the expense of the Howard family, and saved from destruction during the Rebellion by John Rich, a brasier, who presented it to Charles II., in whose reign it was re-erected in 1674. This graceful and commanding bronze statue has been erroneously described as of lead. The same artist commemorated James I. by a bust over the principal entrance to the Banqueting House, and both James I. and Charles I. by statues now on each side of the choir at Winchester Cathedral. An equestrian portrait of Charles II. was set up in the Stocks Market by Sir Robert Vyner in 1672, which had a similar fate to the George II., of lead, brought from Canons, the seat of the Chandos family, and set up in Leicester Square in 1754. The statue of George III. in Cockspur Street was not erected till 1837, and is by Matthew Wyatt, and the George IV. in Trafalgar Square was not completed till after the artist's (Sir Francis Chantrey) death in 1843. It would be easy to produce faithful representations of at least Elizabeth, Cromwell, William III., and Marlborough, and who would all form splendid subjects for commemoration in this manner.

Statuary was formerly rendered realistic by colouring, and the material chosen mainly for texture, more than one material being used for producing a single figure. Ivory for the flesh and golden drapery was most favoured, but Parian, Naxian and Pentelic marble, probably left white for the flesh, with coloured hair, eyes, &c., and drapery, were most often used for female figures. Sometimes the head and limbs only would be marble and the rest of porous stone filled in with stucco and strongly coloured. There can be little doubt as to bronze having been chosen to represent athletes and demigods from its colour re-

sembling the sunburnt bodies of these, and probably the original colour was carefully maintained. Otherwise the pallor of death given to Jocasta by alloying with silver, and the red blush of shame to Athamas by iron, as Pliny says, would have disappeared under the ordinary patina, even under Grecian skies, after a few days' exposure. We are accustomed to admire bronze for its patina, and to take pleasure in the varying shades of rich browns and greens it assumes everywhere away from our fuliginous cities, and cannot understand the obvious admiration of the ancients for the natural golden glint of the well-scoured metal, often replaced by actual gilding. But then we are equally unable to realise their love for polychromatic statuary, the idea of painting or staining marble being repugnant to us. We even dislike, or are slow to replace, the gorgeous blue, scarlet and gold decoration of the carved stone interiors of our Perpendicular churches and screens.

Admitting that art bronzes are to be patinated, the question of the best means of controlling and producing the tones becomes of interest. The Japanese excel in this. Our own empiric methods range from inhumation in a dung-heap to suspension up a smoky chimney—preferably where wood or peat fires are burnt, besides acids and alkalis and trade solutions, the components of which are secrets. The exhaustive researches on the cooling of bronze alloys carried on within the past few years shows that the metals remain separate and crystalline, but present structures as diverse as those of the porphyries, gneisses and granites, according to the rate at which they are cooled. The tones of the more delicate natural patinas would be considerably affected by the internal structure of the alloy. The chemicals useful for the purpose will be found chiefly among the muriates, ammoniates and sulphides.

The time remaining at my disposal must be given up to a form of monument which was practically never known in England, and the high symbolic import of which is even yet scarcely appreciated.

When not only palaces and pleasure-grounds, but every edifice, sacred or lay, and every city, was closed with defensible and well-nigh impregnable gates, the question as to whether these would be found open or shut must have been of the most momentous. The hope of the night's shelter, warmth and food hung upon the contingency, and oft the traveller must have been met with the stern rebuke, "Too late, too late; you cannot enter now." Inevitably the imagination fenced in the places to be desired in a future life with gates inexorably closed except to the favoured few. The keys of the gates of heaven or Paradise were committed to St. Peter, rarely to be opened to anyone without intercession, but the gates of hell and purgatory gaped wide. Open or shut gates were the focus of interest, and could not be approached in primitive days without awe, curiosity or emotion. It is hence not surprising that they were sumptuously and magnificently decorated. The Roman triumphal arch was only the apotheosis of the gate, recalling difficulties gloriously overcome. The question, figuratively, of the open or closed door to commerce is almost the only one about which civilised nations might still go to war.

In the days when iron was little used, the massive wooden doors were sheathed for protection from fire and for strength in bronze, and revolved upon massive bronze hinges. Upon these were sometimes pictured the mighty deeds of the monarch of the country. The bronze portions of two pairs of enormous doors were found many years since by Mr. Harmuzd Rassam in excavating at Balawat in Assyria. The city contained a palace standing in a long rectangular enclosure, with four entrances, near two of which the remains of the doors were found. The larger were about 22 feet high, 6 feet wide and 3 inches thick, each leaf being attached to a cylindrical post, about 18 inches in diameter, to which strong bronze pivots were fixed, working in stone sockets. Across each door seven or eight plates of bronze 11 inches wide were fixed by nails at regular intervals, these plates lapping round the post. On each of these plates are representations of the Assyrian army on its war path, and other events of the first nine years of the reign of Shalmaneser II. These are in two bands of repoussé work, executed with great fidelity and spirit and much freedom of drawing. Between embossed bands narrow spaces are left, relieved at regular intervals with the rosettes through which the nails are passed that fixed the plates to the woodwork of the doors. The "brazen gates" of antiquity were probably of this kind, and we are singularly fortunate in the possession of these splendid examples by our national museum.

Of the Roman period there are several bronze doors, but of a different type and not depending on wood for their construction, still preserved in Rome itself. These are the large central doors of St. John Lateran, decorated with foliage, and brought from the Æmilian Temple in the Forum and of about the date of Our Lord. Another pair, brought from the Baths of Caracalla, and of about the third century, close the oratory of St. John the Baptist, in the church of S. Giovanni in Fonte, the ancient baptistery in Rome. The vast bronze doors of the Pantheon remain in their original position, dating possibly from the time of Agrippa, 31 B.C. The doorway of marble, 39 feet high and 19 feet wide, contains their massive framing, consisting of two bronze pilasters, to which the doors are hinged, and the lintel over them, which is a pierced bronze scale-pattern grille. The doors themselves are not decorated in relief, but are of severe and dignified simplicity.

Next in point of antiquity are the Byzantine gates which revert to the partly wood construction of the East. Examples of these still exist in Constantinople, but the best known are the bronze doors to the vestibule of St. Mark's in Venice. Some of these were brought from Constantinople, it is supposed, from S. Sophia, after its reconstruction by Justinian, and may date back to the sixth century. Three of the oldest are divided into four panels of double arches, with crosses and foliage rising out of vases under each arch. The other two are in the later Byzantine style, the central one, of early eleventh century, divided into forty-two framed panels inlaid with figures of saints in silver, the heads of some in relief, and a lower row of six panels decorated with bosses only. The frames are broad and studded with bossed nails, and twisted pillars separate each row of panels vertically. The remaining door is treated similarly, but divided into twenty-eight panels with figures, and is older, since the inscriptions are in Greek characters. The frames of the panels are richly decorated with geometric and florid designs, and there is a central row of six lions' heads among the bosses. In the large central doors these are replaced by a row of eight lions' heads with rings, and the inscriptions identifying the prophets and saints are in Roman characters.

Next in age are the principal doors from the venerable abbey church of Monte Cassino, executed by order of Abbot Desiderio, later Pope Vittorio III., 1088. They also are inlaid with silver curiously reciting a list of the properties held by the abbey in 1066. The crosses at the base are like those of the earlier doors of St. Mark's. The cathedral at Amalfi has doors similarly ornamented; and the doors of the cathedral at Salerno, erected by Robert Guiscard, are also inlaid with silver, and were executed at Constantinople in 1099. Other examples exist.

The central doors of the cathedral of Benevento are divided into seventy-two panels, filled with bas-reliefs, except four containing lions' heads with ring handles. Those above represent scriptural scenes crowded with figures, and below are single saints under simple canopies. The framing is made of egg-and-tongue moulding, with large rosettes at the intersections. They are supposed to have been made in Constantinople in 1150.

There are exceedingly interesting bronze doors at Canosa closing the Mausoleum of Boemond, the son of Robert Guiscard; portions of the cathedral doors of Susa, of Byzantine eleventh-century work, are preserved in the treasury of that cathedral.

Bronze doors of Italian make first appear in the twelfth century, the earliest artist of whom we have definite records being Barisano da Trani. The bronze doors to Trani cathedral, made in 1160, are his work, and are divided into thirty-two panels of subjects in relief with rich scrolled borderings, and mounted on hard wood. The side doors of Monreale are by the same artist, but somewhat later, divided into twenty-eight panels with reliefs and excessively rich borderings. Even finer are the doors of the cathedral of St. Pantaleone at Ravello, by the same artist, and produced in 1179. The figures are very varied and of some merit, considering the date, and constitute a landmark in the history of Italian art. Equally celebrated for bronze work is Bonanno da Pisa, who produced the great central doors of Monreale in 1186. The entrance is arched and richly sculptured, and the doors are divided into forty small panels, with scriptural subjects in relief, and in plain frames studded with rosettes and separated vertically by bands of acanthus foliage treated conventionally. At the base are two lions and two griffins, and above are enthroned the Saviour and the Madonna with angels. To the same artist we owe the doors of the Baptistery at Pisa, less

important as to size, but more delicate in design and workmanship. To the last year of the thirteenth century belong the well-known openwork scale pattern doors of St. Mark's, Venice, inscribed "MCCC + Magister Bertucius Aurifex Venetus me fecit +." The details of these are noteworthy.

The doors of S. Zeno Maggiore at Verona are in the Italian style, but have been assigned to an unknown German artist, who produced them in 1178. They comprise forty-eight panels with scriptural subjects in relief and two with large heads, serving as knockers or closing rings. They betray a slight tendency to the grotesque, but the architectural details seen in the panels are of great interest, suggesting an Italian source.

With the appearance of Andrea Pisano in the fourteenth century we reach more familiar ground. He was commissioned in 1311 to make the doors to the baptistery of the cathedral in Florence, designed by Giotto, being regarded as the best artist for the purpose to be found in all Italy. They occupied twenty-two years, notwithstanding the assistance of his son and two fellow artists, Lippo Dini and Piero di Jacopo, and were cast in Venice by Master Leonardo del Avanzo, and finally gilded by fire in 1339. They were shifted from the northern entrance to make way for the gates by Ghiberti, and re-erected at the south. They consist of twenty-eight panels with scenes from the life of the Baptist in relief, placed in barbed quatrefoils with rectangular moulded framing, studded with bosses and lion heads in relief. When they were set up the Signory came in solemn state to applaud the artist and confer on him the dignity of citizenship. The architrave was added by Ghiberti, who made a corresponding pair of doors for the northern entrance in 1403, when he was but twenty-two. These occupied twenty-one years, though many assistants were employed, including his father-in-law, Bartoluccio, a great silversmith. They weighed 34,000 lbs. and cost 16,204 florins. Founded on the work of Andrea Pisano they nevertheless show marked progress in Italian art. In 1425 the same Lorenzo Ghiberti was commissioned to execute the central doors, spoken of by Michel Angelo as worthy to be the gates of Paradise. They mark an entirely new departure, a striving for pictorial effects, to an extent never before attempted. Ghiberti has left on record that he "strove to imitate nature to the utmost, and by investigating her methods of work to see how nearly I could approach her. I sought to understand how forms strike upon the eye, and how the theoretic part of sculptural and pictorial art should be managed. Working with the utmost diligence and care, I introduced into some of my compositions as many as a hundred figures, which I modelled upon different planes, so that those nearest the eye might appear larger, and those more remote smaller in proportion." Perhaps the novelty led to the somewhat exaggerated praise. The founding was commenced in 1440 and completed in 1452 at a total expense of 14,594 florins. They thus occupied twenty-seven years, or, according to Vasari, forty. The scenes are from the Old Testament, and fill the ten panels. The framing comprises twenty statuettes in niches and four recumbent figures, and twenty-four heads in the highest relief, among them one of the sculptor himself. The framing of the doorway, also of bronze, comprises foliage, fruit, flowers and numerous animals and birds, all in high relief.

Florence also boasts two small pairs of doors by Donatello for the sacristies of the church of S. Lorenzo, with ten panels in relief of saints and martyrs. These were produced in about 1457, eleven years before his death. There are also bronze doors to the sacristy of the cathedral by Luca della Robbia, executed in 1464, comprising ten panels of subjects in high relief, which have almost the finish of silverwork, and were highly commended by Vasari.

A pair of magnificent bronze doors were cast for the Triumphal Arch of the Castel Nuovo at Naples, erected by Pietro di Martino for Alfonso of Aragon, to commemorate his entry into the city in 1443. They occupied nineteen years, not being finished until after his death—a grief to a prince known as the Magnanimous, and a great patron of art. Guglielmo lo Monaco of Umbria completed the work in 1465. They are divided into six large panels, the two uppermost forming segments of an arch, all crowded with figures of mounted men at arms in battle array, with citadels in perspective in the background.

The art of bronze-founding had, no doubt, attained its zenith in Italy in the fifteenth century, yet to the sixteenth belongs the superb door to the sacristy of St. Mark's, Venice, by Jacopo Sansovino, produced about 1529, when he was

appointed architect and sculptor to the Venetian Republic. It is divided into two panels, with scenes from the life of Christ, bordered in the manner of the later Ghiberti gates, the portraits being, however, of great interest, since they are those of himself, Titian, Aretino, Paul Veronese, Giorgione and Tintoretto.

The front of the cathedral at Loreto has three pairs of most sumptuous doors, the central by Girolamo Lombardi, of Ferrara, and his sons, who worked on them from 1534 to 1560. They comprise six large and eight smaller panels, illustrating the story of Adam and Eve, with richly worked borders. The left-hand doors are by Tiburzio Verzelli da Camerino, of somewhat later date, but corresponding generally in design, and those on the right by Antonio Calcagni, each having employed several assistants.

The seventeenth century produced the three magnificent doors to the cathedral at Pisa, by John of Bologna, executed in 1602, evidently inspired by the later door of Ghiberti in Florence. The principal panels represent scenes from the life of the Virgin, and the borders comprise branches of laurel and of orange, roses, figures, &c., with a considerable tendency to realism. He employed several assistants.

The last of the illustrations shows the bronze gates of the Campanile Loggia in Venice, to our taste perhaps wanting in repose, but comprising some fine modelling. Gates of this sort are almost confined to Italy, and few exist anywhere wholly of bronze unless closing an arch or entrance. Little appears to be known of the artist—Antonio Gai.

It may have been noticed that the doors were originally modelled on the lines of the strongest form of wooden doors known, and the interspaces occupied by the panels are therefore necessarily reduced to very small dimensions. Ghiberti was the first to abandon the strongly constructional form and introduce larger panels, and these were generally adopted, until in the doors at Naples there are only three panels to each leaf.

In England we have rarely since Mediæval days, when splendid ironwork was laced over doors to give them strength, been conscious of the decorative value of metal for doors, though the Italian artists had for centuries lavished their finest work upon them, and many were famous *chefs-d'œuvre*. The oldest bronze gates we have close the entrance to Blenheim Palace. In London there are bronze gates closing both the Marble and Wellington arches, and there is a pair in the central arch to Buckingham Palace. Those for the Marble Arch cost 3,000 guineas.

There are many occasions when relatively small sums are available for commemoration, and many sites where beautiful gates, whether of iron or bronze, would add greatly to the importance and dignity of the scene. Memorial gates can be and are produced at from 60*l.* to several hundred pounds, in iron, and I have plans before me for bronze gates running into thousands. When these are executed it may be interesting to describe the process of manufacture from the commencement. A very fine pair of bronze doors for a Liverpool bank is illustrated in the "Encyclopædia Britannica" under Art Metalwork.

In conclusion, I have to express my thanks to Sir George Birdwood, our chairman, for his kindly introduction; to Mr. William Reid, of Lauriston Castle, Middlethian, who obtained for me during his recent tour in Italy the illustrations you have seen; and to Lady Theodora Guest for most kindly translating the descriptions of the gates which I have made use of, from the original Italian.

VALUATION FOR RATING.

A REPORT has been prepared by the local government, records and museums committee of the London County Council respecting the reform of the process of valuation for rating. In the speech from the throne it was announced that His Majesty's Government proposed to introduce legislation in the present session for amending the law with respect to valuation authorities and the procedure for making valuations. Several resolutions have been received from metropolitan borough councils in favour of the reintroduction, with modifications, of the Valuation Bill of last year, and as the Council has devoted considerable attention to the reform of the valuation system, and is largely concerned as representing the ratepayers in the county of London, it was thought to be desirable to ask the Local Government Board to afford the Council an opportunity of submitting its views; and a reply has been received, stating that the Board will be glad to consider any suggestions in writing which the Council may wish to submit.

The Council on February 25 and March 4, 1902, adopted a scheme for the reform of the valuation system in London, based mainly on the recommendations in the report of the Royal Commission on Local Taxation, and on June 21, 1904, passed various resolutions with respect to the Valuation Bill, which was introduced by His Majesty's Government that year.

The Council resolved:—"That each district committee should, with the concurrence of the county valuation authority, appoint an assessor to be paid out of the county funds, whose duty should be—(1) To prepare all valuation lists; (2) To act as expert adviser to the district committee."

The Valuation Bill of 1904 proposed that the local authority should have the option of appointing a person to survey and value any hereditaments, subject to the consent of the central authority, and also that the central authority, on the application of the local valuation committee, should appoint a competent person to act as assessor to the committee. The objections to both these provisions are twofold. First, the appointment of an expert was optional, and, secondly, if appointed he could only assist the valuation committee whose duty it would be to revise the valuation list, and not the Borough Council, which prepares it. In London, where over two-thirds of the rates are raised centrally by an equal pound rate over the whole county, it is very important that the same system of valuation should apply throughout the entire area, and the valuation of property by an expert would be likely to produce greater accuracy than one prepared under the existing system where no valuer is called in. To consult an expert when the list has been prepared, merely to advise the valuation committee in connection with the comparatively small proportion of cases in which objections are lodged, would be to considerably reduce the value of his assistance. It is most desirable that a skilled valuer, if retained, should be employed upon the work from the beginning, and should be responsible for the preparation of the valuation list in the first instance, as only in that way can the lists be prepared on a uniform and scientific system. It appears that the most satisfactory course would be for such expert assessor to be an officer of the Borough Council, and for him to attend the sittings of the valuation committee when the valuation lists which he had prepared were under consideration. The appointment of such a borough officer would tend to the convenience of the public and to secure economy of time and money. His office would be open to ratepayers for the purpose of inquiries and explanation, and in this way the number of objections would be reduced. As, however, the work of the assessor would benefit the county as well as the borough in which he was employed, it would be desirable that his appointment should receive the concurrence of the central authority, and that he should be paid out of central funds.

The Royal Commission on Local Taxation recommended that an independent assessor of railways should be appointed by the Local Government Board, the expenses of the office to be borne partly by the valuation authorities and partly by the railway companies.

One of the great defects in the Valuation (Metropolis) Act, 1869, is its failure to provide adequate machinery for securing a uniform basis for contributions to common expenditure throughout the county. The machinery for appealing against totals, which was probably intended to effect this object, has been rendered valueless by the decisions of the Courts. The Council's resolution on this point was as follows:—"After the valuation lists have been dealt with by the district committees the county valuation authority should revise the same, and after hearing any objection to the decisions of the district committees should fix the totals."

The Council's resolution with regard to the arrangement for hearing appeals was as follows:—"That the jurisdiction of both quarter sessions and special sessions as regards assessment should be abolished, and that appeals from the decision of the county valuation authority should be dealt with by a valuation court, constituted according to the provisions contained in clause 24 of the Valuation (Metropolis) Act approved by the Assessment Conference in 1894, and the valuation court should sit at the headquarters of each district, costs and fees to be on the lowest possible scale."

Every quinquennium which passes shows more and more the need of an expert tribunal to deal with the complicated questions which now form the subject of appeals to quarter sessions. The business of the Court of Quarter Sessions is mainly criminal, and the members are too numerous from the point of view of dealing with valuation

questions, and are unable to give the time required to studying the rating problems which come before them. Owing to the number and irregular attendance of members of the bench at the London Quarter Sessions it is quite possible for decisions on matters of fact (from which there is no appeal to the High Court) to be given on diametrically opposite bases, according to the views of the majority of members present. It is the practice at the present time to refer a large number of the more difficult cases by consent to a special adjudicator, whose decision ultimately becomes the finding of the Court. The experience of all such cases shows that a small expert tribunal continually dealing with rating cases would be able not only to save much public time, but also to build up a code of general practice which could be recognised and relied upon to an extent which would render it much easier than at present to forecast the probable result of an appeal, and thereby to reduce the amount of litigation.

The Council resolved:—"That adequate machinery should be provided for obtaining uniformity of valuation as between county and county throughout England and Wales." There was no provision for this purpose in the Valuation Bill of 1904. The point is important to counties like London, whose authorities own institutions such as infirmaries, asylums, industrial schools, pumping stations, &c., situate in other counties. The Court of Quarter Sessions of these other counties have a direct interest in putting the assessment of such properties at the highest possible figure, and there being no appeal from their decisions on questions of fact, the county owning such properties has no redress against an unfair decision. Such properties should, we think, be dealt with by an independent tribunal, which might be either the Railway and Canal Commission or a tribunal appointed by the Local Government Board.

The Council's resolution was:—"That the system of a quinquennial revaluation should be continued, but that each district should be subdivided into five sections, so that the revaluation may be spread over five years."

This suggestion was not embodied in the Valuation Bill of 1904, but its adoption in London would be of great advantage. All the officials and authorities engaged in the work are now overworked during a few months of the quinquennium, while for the rest of that period they have very small amount of work to do. Great economies could be effected by spreading the work over the whole quinquennium.

We are of opinion that the above suggestions, and also those contained in the Council's resolutions of February 25, 1902, and March 4, 1902, should be placed before the Local Government Board for consideration in connection with the proposed Bill for the reform of the valuation system.

ABUSE OF BY-LAWS.

THE extent to which a peculiar interpretation of by-laws can hinder building operations has been lately exemplified in South Stoneham on buildings of which Mr. R. M. Lucas is architect. It appears that by May 1 two good and substantial six-roomed dwellings should have been built and occupied, and their owner paying rates. For three months or so workmen would have been earning wages in building them. Money which now is to remain invested elsewhere would have been spent in the district. A building worth 500*l.*, permanent rates on two dwellings worth 7*s.* or 8*s.* a week each, three months' wages in the pockets of local workmen, all thrown away, refused for the district on the advice of Mr. Watts, the surveyor, whose last demand is for ventilation between the wood and the concrete of the proposed solid floor.

The circumstances are now fully related in the following letter which Mr. Lucas addressed to the clerk of the Council:—

May 1, 1905.

Proposed Double Cottage at Little Bassett Wood.
Dear Sir,—I shall be much obliged if you will be kind enough to bring this letter before your Council at their next meeting.

Three applications have been made by me on behalf of a client for your Council's permission to erect a simple and substantial dwelling for his coachman and gardener. The last application was rejected on the 11th of last month.

I beg to submit that this rejection was wrongful, as the design and the expressed intentions as to the construction of the building are entirely in accordance with the by-laws,

and that the reasons alleged for the rejection are, as I am advised, unsound and unreasonable, being due firstly to an apparently frivolous or grossly ignorant misreading of the by-laws, particularly those relating to walls and floors, and secondly to the disregard of my statements as to party-wall construction, &c., and the absence of cesspools and sinks (see my letters to Mr. Watts, dated February 18 and April 6).

When returning the plans to me the third time, Mr. Watts, in a letter dated April 12, made the following remarks as reasons for their rejection:—

1. "With regard to main external walls, where larders and w.c.'s adjoin, you know these walls must go up same thickness from the base." (Reply.) These portions of walls referred to are not external walls, as anyone can see, and they may in fact be omitted altogether, as by altering the words "larder," &c., to "cupboard," "recess," or "bay-window." By no definition whatever can the partitions of half-brick between the larders, &c., and the dwelling-rooms be made to appear external walls.

2. "Cesspool receiving bath and scullery waste must be 50 feet from the house." (Reply.) There is no cesspool. There are no sinks. This I had already told Mr. Watts in a letter. As to the bath water, it was to have run into the rain-water tank for garden use. Owing, however, to this unaccountable objection to a very desirable arrangement, the baths will probably be omitted. It is difficult to see how sanitation is likely to benefit through this objection having been made.

3. "Section C.C., not in duplicate and party-wall, must be shown right up to the ridge." (Reply.) This demand is *ultra vires*, for a third section cannot in such a case be required—in fact, Section C.C. was merely sent because, with the elevations, &c., it was on the sheet of working drawings from which one set of deposit-tracings was made.

4. As to party-wall and corbelling, ample assurance had already been more than once given that these would be strictly in accordance with by-laws.

5. "Ventilation under floors in accordance with by-laws." As to this, Mr. Watts telephoned to me two or three days before the Council met to consider the third application, asking for particulars, although the plans are perfectly clear on the point, and the same kind of floor exactly has been shown on each set from the first. I explained that the floors in question (the ground floors) were just the ordinary solid wood-block floors laid direct on concrete with tar, in short or long lengths. Mr. Watts replied that, in accordance with by-law 64, ventilation must be provided between the wood and the concrete. I pointed out that this by-law referred solely to hollow wood floors and that such ventilation would prevent the proposed floor being a solid floor—in fact, that such ventilation was impracticable altogether. It would be no more ridiculous to ask for ventilation under the tiles of a scullery or the asphalt of a footpath. In spite of my explanation of this simple matter of ordinary floor construction, Mr. Watts repeated that ventilation must be provided, and asked if he might take it that the floors would not contravene the by-laws. I replied that he might certainly do so. Yet the plans are again returned—a third rejection; but the first on this account, no notice whatever having been taken of these floors before.

Compliance with a request of this kind is, of course, absolutely impossible; and I respectfully ask your Council, sir, to put these three questions to Mr. Watts. (1) Whether he understands how to construct an ordinary solid floor; (2) whether he made his long-delayed demand for this ventilation ignorantly or maliciously; (3) why, in either case, he did not make it when commenting on the first and second applications showing this same floor? Mr. Watts's letter concludes with a very extraordinary request for a new set of plans, alleging that they have been "mutilated." Now, before replying to this request, I must call your Council's attention to the fact that my plans have been damaged and obscured, while in Mr. Watts's charge, by someone scribbling on them in several places and by tearing off and scratching up pieces of linen which had been carefully pasted down, and by pinning one piece on in a careless manner. Am I to understand that the alleged "mutilations" formed one reason for the return of the plans and the request for a new set? If so, and if such plans are still asked for, I shall certainly demand from your Council or their surveyor the charge to be made for preparing them.—I am, dear sir, yours faithfully,

R. M. LUCAS.

Mr. E. T. Westlake, clerk to the South Stoneham Rural District Council.

**The Edinburgh Architectural Association.—Proposed
Autumn Exhibition.**

SIR,—An exhibition in Rome of drawings and photographs of architectural "refinements," part of the research work of Mr. W. M. Goodyear, of Brooklyn, has recently aroused much interest amongst architects and antiquarians in Italy.

In view of the increasing recognition of the importance of Mr. Goodyear's investigations, and in the belief that a knowledge of them must be of high educational value alike to architects and amateurs, the Edinburgh Architectural Association desires to seize the opportunity of this collection being in Europe to hold an exhibition in Edinburgh during the months of August and September.

The trustees of the Brooklyn Institute of Arts and Sciences have been generous enough to offer a loan, not only of what is at present in Rome, but of the whole of their extensive collection, to which Mr. Goodyear himself most kindly proposes the addition of many valuable drawings which are his own property. A complete representation of the work so far achieved would thus be attained.

"Refinements" in Mediæval architecture are still under investigation, and this exhibition would commit neither the Edinburgh Architectural Association nor any one connected with it to definite views as to their origin or their intention. That Greek work is full of constructive curves is now accepted as a commonplace, and Mr. Goodyear contends that Egyptian and Roman remains show corresponding deflections from the straight line. The mass of evidence which he has collected, to indicate the linking on to classic tradition of the far more complex Mediæval building, is given to the public in the photographs and drawings now proposed to be exhibited. Apart from any conclusions one way or another as to their significance, the facts ascertained by Mr. Goodyear are of the greatest interest, and must act as an immense stimulus to more searching investigation and more accurate observation of the irregularities of Mediæval work. That America has led the way in this matter is no reason why we in the Old Country should lag behind, and the first step is to become familiar with the results already attained.

The expenses of freight, insurance, advertising, the printing of the necessary catalogue, and other outlays incidental to an exhibition are greater than the Association can meet alone, and it confidently appeals to those interested in architecture, archæology and education to assist its members in raising a fund of about £200. Cheques may be made payable to Colin B. Cownie, hon. secretary, Edinburgh Architectural Association, 17 York Place, Edinburgh.

A few subscriptions, varying from one to ten pounds, have already been received.

As it is essential that the trustees of the Brooklyn Institute have a reply to their kind offer this month, your attention to this circular before the 27th inst. will much oblige.—I am, sir, yours obediently,

HAROLD O. TARBOLTON,
President of the Edinburgh Architectural
Association, 117 George Street, Edinburgh.

GENERAL.

The Tate Gallery trustees have accepted, on behalf of the nation, the late Robert Brough's picture "Fantaisie en Folie." Mr. Brough made the provision in his will that if the picture was not accepted by the Tate Gallery it was to be given to the Aberdeen Art Gallery.

M. Allar has been elected to fill the vacancy in the sculpture section of the Academy of Fine Arts caused by the death of M. Emile Guillaume. He was born in Toulon in 1845, and is a former "Prix de Rome." Among his works are a "Jeanne d'Arc," "Les Adieux d'Alceste" and a "Sainte Cécile."

Government House, Cape Town, will shortly contain a gallery of portraits of all the representatives of British rule who have lived there since 1806, when the colony was ceded by the Dutch. The first of these replicas is that of the second Earl of Caledon. It is being executed by Mr.

Catterson Smith, Royal Hibernian Academy, from the original which hangs at the family seat in county Tyrone.

The Incorporated Association of Municipal and County Engineers will hold their thirty-second annual meeting in Norwich on June 22, 23 and 24, with Mr. A. E. Collins, Norwich city engineer, as president. The Association comprises about 1,100 members, including colonial and continental engineers. One of the important matters to be discussed at the Norwich conference is that of building by-laws.

M. Albert Besnard, the painter, has been selected to fill the vacancy in the Superior Council of Fine Arts caused by the election of M. Roll as president of the Société Nationale des Beaux-Arts. By virtue of his new office M. Roll is an ex-officio member of the Superior Council.

The Bucks. Archæological and Architectural Society's Jubilee Exhibition will be opened on July 5 at Aylesbury by the president, the Earl of Rosebery.

Mr. W. Banks Gwyther, architect, has proceeded to Simla, where he will be on deputation duty under the Department of Commerce and Industry for about three months, in connection with the scheme for the extension of the Indian Museum, Mr. H. H. Risley, representing the trustees, and Mr. E. B. Havell, of the School of Art, being associated with him in the preparation of the project.

"The Capture and Blinding of Samson," by Rembrandt, formerly belonging to Count Schönborn's gallery in Vienna, is about to be sold to the Städel Gallery at Frankfurt-on-Main for 16,750*l.*, the highest price a picture ever fetched on the German art market. It was painted in 1638, and is, after the "Night Watch," the largest canvas left by Rembrandt.

The Dutch Second Chamber have voted 58,300*l.* for the purchase of a site, measuring five hectares, in the park at The Hague known as "Zorgvliet," for Mr. Carnegie's Palace of Peace.

The Chichester City Council on Friday last elected Mr. Frank J. Lobley, surveyor of Hale, Cheshire, to the post of surveyor and inspector of nuisances, in place of Mr. Pym Jones, resigned, the inclusive salary offered being 150*l.* per annum. The three other candidates selected by the sub-committee were Mr. Thackeray, of Eastbourne; Mr. Chivers, of Eastleigh; and Mr. Percy Beeham, surveyor's assistant at Chichester.

Mr. J. Meikle Alexander, a partner in the firm of Messrs. F. W. Mayor & Co., architects and builders, of Tithebarn Street, Liverpool, died on the 19th inst. in his forty-third year. Mr. Alexander acted as president of the Liverpool Artists' Club.

The Liverpool Institute, which includes the Blackburne House and the School of Art, was formally handed over on Monday to the civic authorities. These institutions, which are fully equipped, have an attendance of 1,100 or 1,200 students of both sexes. To the gift of the buildings must be added a very large cash investment, including a reserve fund of 20,000*l.* and a scholarship fund of 16,000*l.*, and a considerable area of freehold land, particularly in the case of Blackburne House, which was placed at the disposal of the Institute as a school for girls.

The North British Railway Hotel, in Glasgow, has been reopened. The building has been increased in height by the addition of an attic storey and the entire interior has been reconstructed. The hotel contains 105 bedrooms. The fireproofing of the entire building was carried out by Messrs. P. & W. Maclellan, Ltd., Clutha Works, Glasgow and London. The work has been executed in accordance with the designs of Messrs. Baird & Thompson, Baird Street, Glasgow.

The Visit of the Society of Architects to Chester and Liverpool will be on June 2 and 3. Applications for railway tickets from Euston only, with a remittance of one guinea for each person, must be made to the secretaries not later than May 29. Those joining the party at any other centre but London will make their own travelling arrangements.

The Baths Committee of the Bradford Corporation on Wednesday decided to recommend an outlay of 40,000*l.* on new baths.

Proposals are before the Senate of the University of Cambridge for the establishment of a diploma in forestry and the organisation of a scheme of instruction and examination on that subject, and a syndicate is to be appointed to consider the question.

THE WEEK.

IN his charge at Portsmouth, Archdeacon FEARON, on Saturday last, expressed his surprise at the excellent condition of nearly all the churches he visited. "It was quite marvellous," he said, "and a cause for deep thankfulness, to see what admirable work of restoration had been done all over the county during a time of anxious trial and depression in the past fifty years. It was most touching sometimes to observe cases where both parish and clergyman were obliged to stint their personal needs, where money and care had never been stinted, to maintain the shrine of the highest aspiration in a condition worthy of its consecration. At present he should say, roughly, that of the 220 churches he had not seen more than six or seven which seemed to him urgently to need any large expenditure of money, while in most of these cases the necessary expenditure was already proposed." It is not often authorities are willing to testify to the services which architects and builders render in upholding churches. The financial difficulty affects them also; there is generally not merely a delay in payment, but in the majority of cases the amount received can only be a scanty remuneration for the work done.

THE competition for the new public library in Worthing has been decided in favour of Mr. H. A. CROUCH. Mr. BELCHER, A.R.A., was the assessor. Three additional plans were selected by the committee to send to Mr. CARNEGIE, who is supplying the funds for the erection of the library. They were by Messrs. LANCHESTER & RICKARDS, Messrs. RUSSELL & COOPER and Mr. J. O. GIBSON. There has been some delay in the final determination. Mr. CARNEGIE had been travelling in America and the plans were despatched to him. At New York they were retained by the Customs authorities, who imposed a duty of 19% upon the parcel. At length they reached Mr. CARNEGIE, who gave his preference to the design marked "N" (Mr. CROUCH's). Although separate tenders have to be obtained for the library, Mr. CARNEGIE insists on the Local Government Board sanctioning the borrowing of money for the erection of the technical schools, which should form part of the group. As the rate which can be levied, or a penny in the pound, will only bring in 610%, the financial position of the project is not considered satisfactory unless the West Sussex County Council will be sufficiently liberal in granting money towards building.

THE decision which was given by Mr. Justice FARWELL in HIGGINS v. BETTS is another revelation that an imaginative interpretation of COLLS v. HOME and Colonial Stores is not wise. The owners of opposite properties are not henceforth to be expected to allow buildings to be raised without restriction. Indeed, it would seem that the humbler the property and the narrower the street the more are old rights of light and air to be considered sacred. The plaintiff in the case was the occupant of a public-house having a frontage of 67 feet to Benjamin Street, which has a width of only 13 feet and has an outlet to Cow Cross Street, near the Farringdon Street station. A building on the opposite side which was only 30 feet in height was proposed to be increased to 38 feet, and the plaintiff's dining-room, which used to have 67 degs. of light, was left with only 32 degs. The bar and other rooms also suffered. An interim injunction had been obtained, but the operations were not suspended. Mr. Justice FARWELL remarked it was generally supposed that COLLS's case had caused a greater disturbance than it had. He said that any interference with the comfortable use and enjoyment of a house was actionable as a nuisance. Noises

or disagreeable smells were similarly actionable. The difference between the right to light and the right to freedom from smell and noise is that the former has to be acquired as an easement in addition to the right of property before it can be enforced; the two latter are *ab initio* incident to the right of property. The wrong done is in both cases the same, viz. the disturbance of the owner in his enjoyment of his house. But in the present case there was more than a mere nuisance, for the premises were materially affected with serious results to the plaintiff's business. Owing to the privation of light he could not carry on his business as beneficially as before the opposite building was increased in height. His Lordship in granting the injunction said he hoped that the architects on either side would be able to arrive at some reasonable arrangement, and so prevent the case coming back for consideration again in an inconvenient form.

UNDER Section 60 of their General Powers Act, 1898, the London County Council can "purchase by agreement buildings and places of historical or architectural interest or works of art, or contribute towards the cost of preserving, maintaining and managing any such buildings and places, and erect and maintain or contribute towards the provision, erection and maintenance of works of art in London." This power, which was obtained owing to the fact that the Council had no power to expend money on the *Boadicea* group, it appears only applies to buildings and places of historical or architectural interest or works of art. Although the Council have full power to purchase, erect and maintain or contribute towards the provision, erection and maintenance of works of art, it cannot spend money in acquiring or maintaining buildings in which to preserve and exhibit such objects. The records and museum committee consider that this state of things should be remedied without delay, in order that the Council may not be precluded from considering any offers which may be made to it. They accordingly recommend:—"That an application be made in the next session of Parliament for an amendment of Section 60 of the London County Council (General Powers) Act, 1898, so as to enable the Council, if it thinks fit, to acquire, maintain and manage buildings for the preservation of works of art, &c., or to contribute towards the cost of maintaining and managing any such buildings."

IN his articles on JEAN GOUJON which are appearing in *L'Art* M. HENRY JOUIN, the secretary of the Ecole Nationale des Beaux-Arts, has cast some light on the history of the French sculptor. There can be no question that tradition was correct in assigning to JEAN GOUJON many of the examples of architectural sculpture which are to be seen in the Hôtel Carnavalet, now used as the museum of Old Paris. The figures on the keystones of the arches and the charming escutcheon over the entrance were undoubtedly executed by him. But it is now believed that the figures of the Four Seasons, although designed by him, were carved by some other sculptor. There exists some doubt as to whether the sculpture was commissioned before or after the owner of the mansion appeared as one of the ambassadors from France at the Council of Trent. As there is an absence of ecclesiastical symbols it is likely the work was undertaken before his journey. LESCOT was the original architect for the Hôtel Carnavalet, but JEAN BULLANT also held that office. It is therefore inferred that LESCOT had to give up the appointment in order to devote himself to the work of the Louvre, in which case JEAN GOUJON would be likely to imitate him. It is, however, strange that, although the sculptor must have had workshops in Paris, no record remains of where they were to be found. There is a tradition that they were in the neighbourhood of the house of CLEMENT MAROT, the poet. In that case they would be near to the site of the Rue Racine in the Quartier Latin.

ASSESSORS' DUTIES.

A LARGE part of the latest number of the Journal of Proceedings of the Royal Victorian Institute of Architects is occupied with an account of an affair which has caused some excitement throughout Australia. In other words, there were discussions and voting as to whether two members had been guilty of conduct derogatory to their professional character, and whether they should not be suspended from membership for a period of twelve months. The two architects, Mr. GEORGE CHARLES INSKIP and Mr. WALTER R. BUTLER, were prominent members of the Institute, the latter having been a member of Council for no less than twelve years. The circumstances which brought them into disfavour were of a kind which should not be judged by local circumstances. The two members, who were partners, accepted a semi-judicial office in acting as assessors and advisers in a competition. The office is not one peculiar to Australia, and therefore should be judged by some general principle of action which is accepted in other countries where competitions occur.

It appears that over a year ago a Mr. SYME invited competitive designs for professional chambers. Architecture as a business has not been flourishing of late, and the invitation was responded to by other architects besides those in Melbourne. Mr. SYME, it appears, appointed Messrs. INSKIP & BUTLER to assist in the judging, and they sent in a report to him about the middle of May, 1904. The competitors were not informed of the result until July. The news, however, got abroad that Messrs. INSKIP & BUTLER had prepared sketches for chambers on the site. When the Council of the Institute heard of what was done it was resolved to hold an inquiry, and a committee of five members was appointed for that purpose. Evidence was taken, of what kind is not stated, but the conclusion was arrived at that the two assessors had been guilty of unprofessional conduct. They were informed that judgment would be pronounced at the next meeting, but, if they appealed, a special general meeting would be called. When it is considered how important is reputation to an architect the precipitancy of the Council, although it may have been a sign of zeal, was undoubtedly indecorous. It was, however, only another instance of that belief in their own absolute authority which is one of the characteristics of the councils of architectural societies.

Then it was heard that Messrs. INSKIP & BUTLER were acting under legal advice, which no doubt aggravated the alleged offence in the eyes of the Council. They also sought the help of lawyers and they discovered, what ordinary business men should have known before, that they were in error in delegating the duty to five members instead of three, and in deciding to hold an "inquiry" into the "conduct of the competition," instead of bringing a "charge" against a member. New tactics were adopted. The three members who had conducted the previous inquiry were entrusted with the duty of investigating the charge which was made by another member of the inquiry committee. As a result a report was prepared which was adopted by the Council and by which it was resolved that Mr. INSKIP and Mr. BUTLER should be suspended for a year. Meanwhile Mr. INSKIP resigned, and the Institute ascertained from their lawyers that it was doubtful whether he was amenable to them, and the intended judgment against him was cancelled. Mr. BUTLER resolved to face the proceedings in spite of the prejudice against him.

According to Mr. BUTLER's statement, the partners were appointed as advisers, and they advised Mr. SYME to award premiums to certain designs. Mr. SYME objected to award premiums, and his solicitor thought he need not pay them. Then he informed the competitors that he had sold a portion of the land. The first competition might therefore be considered a fiasco, and if there was any grievance among the competitors it should be charged to Mr. SYME rather than to his advisers. He next asked Messrs. INSKIP & BUTLER to prepare

plans for chambers on the restricted site. According to Mr. BUTLER, there was not an item in the competitor drawings they were asked to follow or had followed. There were only five possible ways of dealing with the light areas, and inevitably some similarity in all the arrangements for that end was to be expected. The meeting, however, was in favour of upholding the Council's determination, and by 11 votes to 6 it was decided that Mr. BUTLER should be suspended from membership for a period of twelve months. Whether by their success the Council have involved themselves in a serious responsibility is a question which deserves investigation by a court of law. For to declare that an architect has been guilty of conduct of an unprofessional character is a serious affair, especially when we remember that the *gravamen* of the charge is that Mr. BUTLER did not suggest to the owner to open negotiations or consult with the authors of any of the designs placed first, second or third, upon which they reported favourably.

If there existed an accepted code of ethics relating to professional practice by which an assessor was expected to become the champion of all the competitors, it might then be supposed that in the Melbourne case there was a departure from a well-established rule. But there is no such code, and English assessors at least have not hitherto acted in that spirit. Several years ago a very angry letter was written to *The Architect* by the late Mr. EWAN CHRISTIAN because an article had stated that he had acted as assessor in a competition for a church, although he was aware there was no money available for the erection of the building. A very large number of architects, between eighty and ninety, were attracted by his name, and believed that the competition was genuine. Mr. CHRISTIAN declared it was for them, not for the judge, to discover whether there were funds for the erection of the building. As regards the promoters of competitions, Mr. CHRISTIAN was no less indifferent. He acted as professional assessor in one of the competitions for new Government offices at Whitehall, although he believed the site was inadequate. A man in his position should have declined to take any step towards the erection of buildings in an unsuitable place. In both cases his attention was concentrated on the plans he had to examine, and it was left to others to consider subjects which were more important. If we find so honest a man excluding all other circumstances from his mind, it is too much to expect that assessors who have still to struggle for a living should be more chivalric and self-sacrificing.

In the history of English competitions cases can be found where public and other bodies, after a competition, gave the commission for the erection of the building to the assessor rather than to the author of the plan which received the highest premium. Clients are supposed to know their own interests, and if they pay the premiums which were promised, and gave no guarantee that any of the prizemen would be entrusted with the erection of the building, there is no law known to the English Courts to prevent them engaging whatever architect pleases them. It is undoubtedly hard that those who have had the trouble of preparing designs should all be disappointed. But the practice of architecture is attended by irregularities which are unknown in other professions.

There may be much else in the Melbourne affair which the Council of the Melbourne Institute have not reported. But taking the official statement as evidence, there seems to be no doubt that the Council wished to display their power as local rulers of the profession, and did not act with that deliberation which is necessary in a delicate case affecting an architect's honour. Clubs and societies are allowed a large amount of liberty in dealing with members, but the Council of the Victorian Institute have been at fault in handling so indefinite a subject as professional conduct just as if it were already expounded in detail in the regulations of the

Institute. It is a weakness of men to expect others to display more virtues than they would in a similar position. Messrs. INSKIP & BUTLER may not think much of their suspension, but they will confer a benefit on other architects by bringing the conduct of the Council under the notice of the Courts. The proceedings are worth attention, as they suggest the need of a clearer idea about an assessor's duties. If he is not under any condition to accept a commission to act as architect, that should be distinctly expressed when he receives his instructions to report on designs.

MODERN CONCRETE CONSTRUCTION.*

ALTHOUGH the revival of concrete must be credited to Englishmen who used it for foundations, military defences and other purposes seventy or eighty years ago, it seems strange that in any treatise on the recent developments of the material there should be no mention of English works. We have before us two elaborate volumes referring to varieties of construction in Europe and America. But the only English work referred to is that of a wharf at Southampton, which is carried on concrete steel piles and was constructed in 1898. As it was executed by a French company, there can be no claim to consider it as an English example. It might therefore be inferred that in Great Britain we have scarcely realised how wide is the applicability of concrete when it is aided by steel in one form or another.

It is true, concrete of the kind is occasionally employed by county councils and railway companies. But they have not at the present time gained a reputation for advanced construction. An American, German or French writer would therefore hesitate in accepting such instances as worthy of record. Not until concrete is used for the exterior of buildings, as well as for floors and partitions, can it gain any noteworthy position among English works. Cases are continually arising for which concrete appears to be the most eligible material, but so long as building regulations are inimical to it, the employment of it must be confined to structures which are beyond official control, or where the supervision is not rigorous.

The two books to which we have referred are by American engineers, and both display that thoroughness for which we suppose Americans are indebted to the German spirit which pervades all their scientific work. Messrs. TAYLOR & THOMPSON have been able to secure liberal assistance from experts. They say:—"To broaden the scope of the work and avoid personal inaccuracies, each chapter has been submitted for criticism to at least one, and, in some cases, to three or four specialists in the particular line treated."

The list of the engineers who have co-operated in the production of the book is long. In England it would be impossible to obtain such varied information, for if a man happens to make a discovery of a trivial kind in construction he is careful to keep it to himself. This is seen especially in the transactions of architectural societies, for however long may be the papers which are read, there is a careful exclusion of facts which could be turned to account by other architects. Messrs. TAYLOR & THOMPSON are therefore able to treat of concreting under numerous forms.

In reading their pages it is easy to understand why the subject should have more fascination than would seem to be possible by anyone who has witnessed the slovenly manner of dealing with concrete in building foundations in this country. As now employed con-

crete calls for an advanced knowledge of chemistry, and the forms given to the steel auxiliaries for strengthening it are so varied, the determination of their proportions is more of a test of mechanical science than the calculation of the ordinary elements of large bridges. Prejudice counts for much, and those whose experience is confined to the use of concrete in primitive forms find it difficult to realise how much delicacy is needed for the perfection of many kinds of work. The following extract from Messrs. TAYLOR & THOMPSON's book will suggest some of the methods adopted in America to impart finish to concrete:—

Concrete or mortar may be cast by special moulds into blocks of any desired size or shape, or moulded for ornamental decoration in designs which vie both architecturally and in durability with finely carved sandstone, limestone and granite. The colour may be slightly varied by mixing different kinds of crushed stone. Artificial colouring matter is apt to fade. Ornaments are run whole in a mould which is made in halves, or are moulded in two or three pieces and cemented together. Moulds of plaster of Paris, shellacked within, are commonly employed. Another method of moulding, similar to that employed for iron castings, is with fine, damp sand, which is sometimes treated by a patented process. A wooden core is made and sand packed around it, then the core is removed, and the mortar is poured in. The surfaces, after setting, may be rubbed down and floated. At the Harvard Stadium the wooden core, which was of the form of an L for riser and tread, was removed from the sand, reinforcing wire placed and thick grout of the consistency of cream run in from a box car. The proportions of material were about 1 part Portland cement to $2\frac{1}{2}$ parts fine crushed trap rock under $\frac{3}{8}$ -inch diameter.

The Harvard Stadium is by itself sufficient to exemplify the modern use of concrete in buildings. It is an American Coliseum which serves not only for games, but for the representation of Greek plays. An immense number of spectators can be accommodated, and there is no misgiving either as to the stability or endurance of the structure. But the uses to which reinforced concrete is applied in the United States are numberless.

MESSRS. TAYLOR & THOMPSON begin with a description of the materials which can be utilised in concrete, and they supply the tests which should be applied to them. There is perhaps less empiricism about the proportioning of concrete than in any other branch of construction, for experiments appear to be made in each important contract, and formulæ are modified accordingly. There are, of course, many rival systems, and it is to the interest of the promoters of each to establish their peculiar advantages. That can only be done by severe scientific testing. The following are the systems of reinforcement which the authors select as being extensively used in the United States, and which are often referred to in papers on construction:—

Bonad.—Metal of cruciform cross-section.

Chaudy and Degon.—Cross rods passing under bearing rods, but looped up between them.

Coignet.—Round bars in top and bottom of beam connected by diagonal wire lacing.

Columbian.—Vertical steel plates with horizontal ribs.

Cottacin.—Round rods interlaced in the same manner as in wire netting.

Cummings.—Bars of different lengths having their ends bent to an incline and formed into a loop to resist internal stresses.

De Man.—Undulated bars.

Donath.—Inverted T-beams or I-beams connected by horizontal diagonals of light flat metal on edge.

Expanded Metal.—Sheet steel, slit and expanded, so as to form a diamond mesh.

Habrich and Düsing.—Flat metal twisted hot.

Hennebique.—A combination of alternate straight bars and bars with ends bent up at an angle, with vertical U-bars; or stirrups, of flat iron passing around the straight bars and reaching nearly to the top of the beams.

Holzer.—Metal in form of I-beams.

Hyatt.—Flat plates or bars set on edge and pierced with holes, through which pass small round rods to form the cross reinforcements.

* *A Treatise on Concrete, Plain and Reinforced; Materials, Construction and Design of Concrete and Reinforced Concrete.* By Messrs. F. W. Taylor & S. E. Thompson. (New York: John Wiley & Sons. London: Chapman & Hall.)

Reinforced Concrete Construction. Part I. Methods of Calculation, by A. W. Buel. Part II. Representative Structures. Part III. Methods of Construction, by C. S. Hill. (London: Archibald Constable & Co., Ltd.)

Johnson.—Corrugated bars.

Kahn.—Horizontal flanged bars with flanges sheared up at intervals.

Lock-Woven Steel Fabric.—Steel wire mesh, locked at intersections.

Melan.—Steel ribs, either I-beams or four angles latticed, embedded in the concrete of the arch.

Monier.—Two series of round parallel bars at right angles to each other.

Parmley.—Bars with bent ends, to be placed in the sides of a conduit or the haunches of an arch to resist tension.

Rabitz.—Various combinations employing galvanised wire.

Ransome.—Square steel rods twisted cold.

Roebbling.—Flat steel bars set on edge, clamped to supporting beams, and held in alignment by flat bar separators.

Schüller.—Like the Monier system, except rods are placed diagonally.

Thacher.—Bulb bars.

Visintini.—Beams of concrete, cored out so as to form lattice girders.

Messrs. TAYLOR & THOMPSON have united the theoretical and the practical in their pages, and their book should be possessed by every architect who is likely to undertake concrete construction.

Messrs. BUEL & HILL begin by treating of methods of calculation for concrete structures, and they give applications of the results. The second part contains representative examples as shown by foundations, buildings, bridges and culverts, conduits, tanks and reservoirs, retaining walls, chimneys, &c.; while the third part describes the methods of construction which are most in favour. Without concrete it is difficult to imagine how the immense buildings which have to be expeditiously raised in America could be accomplished in other materials at so cheap a rate. An ample description is given of each work selected, and the illustrations are in the excellent style of the *Engineering Record*. The following relates to the dome of the Nassau County Court House, Mineola, New York, which was built in 1901:—

It consists of an outer or roof dome and an inner or ceiling dome, the two being carried on a pair of concentric rings, each supported by twelve columns. The ceiling dome is a segment of a sphere with an 11-foot circular skylight at the crown. Its shell is 2 inches thick and is stiffened by radial and circular ribs on the underside. The reinforcement consists of radial and circular $\frac{1}{4}$ -inch twisted rods in the shell and of four $\frac{1}{4}$ -inch bars in each rib. This dome is supported on a 4-inch cylindrical wall or drum $4\frac{1}{2}$ feet high, which has a 10 by 12-inch bottom ring or girder reinforced by two $\frac{1}{2}$ -inch rods. Outside of this drum and concentric with it is another 10 $\frac{1}{4}$ inches thick and 9 feet high. A flat annular roof $3\frac{1}{2}$ inches thick, and reinforced with $\frac{1}{4}$ -inch bars 18 inches apart, extends about 3 feet inward from the top of this drum, and is stiffened by 10 by 22-inch girder ribs on the underside. Each of these ribs has four 1-inch reinforcing bars. These ribs carry most of the weight of the roof-dome drum, 7 inches thick and 6 feet high. The oblique ribs under the circular annular roof are tangent at eight points to the drum-wall on centre lines, and carry part of its weight directly to the inner row of columns and to the large circular girder, while the remainder of its weight is supported by the cantilever action of the circular roof. The roof-dome has a solid shell 3 inches thick without ribs, and is reinforced by $\frac{1}{4}$ -inch radial and circular rods. The horizontal or circular rods are 12 inches apart, and the radial rods are 12 inches apart at the bottom of the drum. The radial rods are set $\frac{1}{4}$ inch from the outside surface for the first 7 feet in height of the dome and then cross over to the same distance from the inner surface, which they follow to the apex. All rods lap 18 inches at joints and are well wired together. The concrete of the dome was composed of Portland cement and unscreened $\frac{3}{4}$ -inch broken stone.

The dome being the most important of all architectural features, there may be objection to have it represented by what will appear to many architects as no more than a casting. In the same way the moulded concrete blocks, which assume the appearance of all varieties of dressed stone, will also be deemed to be

unworthy of the architect's skill. In these respects we are in a period of transition, like that which was seen when machinery first supplanted hand-labour. The great number of people have to be satisfied with imitation of products which were once to be obtained only by manual work. Such things are cheaper, and they are generally as useful as the more expensive varieties. The dome at Mineola affords a larger amount of a space to the court below. It aids in the lighting and was inexpensive. The only objection that can be made to it is that the art of construction has become a mechanical operation, and that ironworkers and labourers are employed instead of masons. There was no necessity for costly centring, and the concrete dome will serve as well for painting or mosaic adornment as if it had been imitated in its creation from one of the older domes of Europe. It is not in America alone similar construction has been adopted. A concrete dome having a diameter nearly 29 feet covers the mausoleum of FREDERICK III. at Potsdam.

There are other kinds of construction which are generally supposed to be outside the province of aesthetics, and for them there can be no objection to the employment of concrete. America insists on its use in tall chimneys, conduits, reservoirs, water towers, columns. The Russian lighthouse at Nikolaief, which is 132 feet high, is another prominent example. It is practically a single piece of reinforced concrete, and the interior spiral staircase is also in one piece. The weight of the structure is 348 tons, while a brick tower of the same dimensions would weigh 1,365 tons. The cost was 40 per cent. less than one of masonry or steel.

There are over 300 illustrations in Messrs. BUEL & HILL's book, and they are so neatly drawn they serve as well as if they were on a large scale. As a record of what has been done of recent years in the United States in the way of concrete construction the volume is invaluable.

THE NEW YORK MUSEUM.

BEFORE Sir C. Purdon Clarke left New York he was invited to a dinner of the New York Chapter of the American Institute of Architects. In introducing the new director of the Metropolitan Museum of Arts, Mr. G. B. Post, the president of the Chapter, said:—It is not so long since that an architect was regarded as a few degrees beneath the carpenter and bricklayer. The first job I was ever offered I never received. My client asked me to draw the plans of a house. I had hardly started when he told me that there was no need for my services; that the carpenter who was to do the building kept an architect of his own. It is with deepest pleasure that I introduce to you the architect who is to come to us from England—a man who is a living illustration of the evolution of the architect—Sir Purdon Clarke.

Sir Purdon Clarke, in reply, said:—"Brother Chips," I am really very grateful to you. I call you "Brother Chips" because in England architects are known as "Chips." I suppose this is because they were stonemasons not so long ago. I have been in your city now about ten days. Every time I have been introduced to a stranger here I have been asked two questions—what my policy as director of the Museum will be, and what I think of the New York skyscraper. To the first question I have answered that my policy would be to do my best for the Museum. To the second query I have to answer more in detail. I was in New York twenty years ago and it looked like any other great city. Now it does not. Your great, big sky-scrapers place the city in a class by itself. American architects have opportunities which are not enjoyed by their brothers in England. I don't know whether you are hampered with building laws as much as we are, but if you are not you will be. For myself, I am an Anarchist. I don't believe any man has a right to tell an architect how much light and air he must provide. It's arrant nonsense—an outrage I call it. Everything that is bad in architecture I put down to the building laws. There is one thing which has impressed me particularly since I have been in your city—the haste with which clients expect architects to do their work. A client will place an order and expect to have the

house by return post. In England, when an architect agrees to construct a house in a year everybody knows it won't be through for a year and a half. In America, when an architect says he will build a house in a year the owner keeps after him all the time to finish it in ten months. I sail for home to-morrow on the *Baltic*. I hope to be back with you soon and to begin my earnest work among you. I shall tell my neighbours at home of what I have seen, and congratulate them on the future which America is opening up for them.

KINGSTHORPE CHURCH.

A PARTY organised by the Archæological Section of the Northamptonshire Natural History Society, which is doing valuable work in calling attention to the many treasures the county possesses, spent an afternoon pleasantly in examining the beauties of Kingsthorpe Church. The building is one worthy of a shire which has particular reason to be proud of its spires, says the *Northampton Mercury*, and the party were fortunate in having as their guide the Rev. R. M. Serjeantson, a gentleman who has made himself intimately acquainted with the history of the edifice, and has written charmingly upon it. The church is popularly supposed to be of Saxon origin—a supposition which Mr. Serjeantson believes unfounded. There is nothing Saxon about the original windows which remain, and the herring-bone work found in the structure is commonly seen in buildings belonging to a later period. Consequently, the rev. gentleman inclines to the view that it was constructed soon after the Norman conquest. Its size was, of course, not then great, and an increasing population soon demanded its extension. Consequently, about a century after its foundation aisles were added to it, arches being cut through the walls of the building. From time to time the church continued to grow. Thus during the reign of Henry III. the next alteration was made. A chapel was added to the church, which was a beautiful specimen of Early English work. In the early portion of the following century the chancel was extended eastwards, while some time in the later half of the same fourteenth century a curious alteration was made. They pulled down the chancel arch and erected another further eastward, which remained until 1863. Somewhere between 1380 and 1400 the crypt was made, and the tower and spire built. Amongst the alterations made at the restoration in 1863 was the pulling down of the south wall and rebuilding in line with the south chapel. Documents contained in the church chest make a number of interesting disclosures. Kingsthorpe was a curiously constituted place, inasmuch as its lands were held direct from the Crown—a very unusual thing for a village. In the time of Henry VIII. the church was much troubled by the rabbit question. Accordingly, a communication was made to the king strongly complaining of the depredations of conies which emerged from Boughton Park and did much damage in the surrounding fields. Said the complainants:—“The fourthe part at the least of the corne and grass of the town is spoyled and destroyed by the said great number of conies remaining in the fields over and beside the destruction of their common, so that it is a great starving and famishing of their beasts, to the utter undoing of the said inhabitants; and this besides the loss of their corne.” Poachers would apparently have had little difficulty in securing booty. Obviously the trouble became acute, and the good men of Kingsthorpe decided that they could not tolerate it any longer. So in 1547 they sent three delegates to the Star Chamber. The fact that the journey took 34 days shows that the travelling arrangements of that interesting time were not very perfect; men could not then rush through space at 60 miles an hour. Still, according to the records yet existing the three delegates of old had a very good time and spent 9*l.* 4*s.* 5*d.*, which, representing about 100*l.* of the money of to-day, was a large sum. A simple method of raising cash was employed—the church plate was sold. In these days when religious organisations benefit financially by the holding of such things as teas, it is interesting to learn, as Kingsthorpe's records show, the less sober way in which the churches in the Middle Ages often raised funds—by the brewing of ale. The laws were framed to assist the Church, and provided that in case of such a brew all other brewers should cease brewing until the ale was drunk. This would have been an awkward time for beer-drinking dissenters. Obviously it was a case of Church ale or compulsory teetotalism.

A canon of 1603 ordered the wardens to provide in every church a comely and decent pulpit, and Kingsthorpe has a

rather good specimen of Jacobean work. The bells in the tower date from the early part of the seventeenth century. The first, dated 1621, has inscribed on it the unpretentious rhyme:—

Robert Atton made me
The treble bell for to be.

The altar-rails date from the time of Charles I. Dr. Clerke, the vicar of the parish between 1608 and 1641, was one of two commissioners appointed to compel the people of the county to erect altar-rails designed to protect the altar from profanation. They were to be “one yard in height, and so thick with pillars that dogs may not get in,” a provision which reads curiously in these times. The church also possesses its chained books: the “Paraphrase” of Erasmus, 1547, Jewell's “Apology,” 1609, and Fox's “Book of Martyrs,” in three volumes, 1641. The donor of the last-named inscribed in the first volume; “I desire that this book (called the ‘Book of Martyrs’) may be kept in the parish church in Kingsthorpe, and not carried to any private man's house lest it be spoyled, or be in time lost.” His desire has been respected. In the church hangs a dilapidated copy of an Act passed in the time of William III. for the suppression of profane swearing. It provided that on and after June 20, 1695, “every servant, day labourer, common soldier and common yeoman” convicted of swearing was to pay one shilling and every other person two shillings for each oath for the use of the poor of the parish. If payment were refused goods were to be seized, while if there were no goods the culprit was to be put in the stocks one hour for each offence. In April 1698 Samuel Witsey for swearing four times was set in the stocks for two hours, and on October 19 of the following year Peter Barrett was fined 10*s.* upon being convicted of profane swearing five several times and of profane cursing five times. Apparently they drew delicate distinctions then. Prosecutions for swearing in those times involved considerable arithmetical calculation. This is instanced in the case of one of the worst offenders mentioned locally, a Hanslope gentleman named Mortimer, who on July 5, 1729, was convicted of profanely swearing six-and-forty awful oaths. He was obviously a voluble blackguard, and was fined 4*l.* 12*s.* for the use of the poor of All Saints parish, where the offences were committed.

ARCHÆOLOGY OF THE SOUTH DOWNS.

A LECTURE was delivered on the 18th ult. by Mr. J. H. A. Jenner before the Brighton and Hove Natural History and Philosophical Society on “The History of the South Downs.” According to the *Sussex Daily Mail* he said it was once thought there were no men of the palæolithic age in Sussex, but the discoveries of Mr. R. Garraway Rice had provided evidence of his existence both at Portslade and Chichester. Neolithic man was known by his weapons, and these, Mr. Jenner reminded his hearers, occurred in enormous numbers on the Downs, and were much more carefully and finely made than those of the palæolithic age. He recalled the paper Mr. Toms had read on discoveries of flint instruments, observing that the great “Sheffield” flint knife and hammer factory of the South appeared to have been at Cissbury, from which site there were many specimens in the museum. At Cissbury the chalk was tunnelled to obtain the fresh flint, which chips so much more easily than that which has been lying on the surface. Other centres he had found were one west of Newhaven, where the flints were evidently obtained from the sea cliffs as well as from some pits, and the well-known district near Eastbourne. These flints appeared to have been bartered with natives of other parts, but from the amount of remains and debris that could even now be found the business must have spread over many thousands of years. Mr. Jenner also quoted from Professor Boyd Dawkins's “Early Man in Britain,” a reference to the activity and fine workmanship at Cissbury.

What language these people used, continued Mr. Jenner, we know not, but it is probable that they tilled the ground to some extent, and the Downs furnished suitable light soil for this. The Weald being covered with forest, they also hunted game and wild animals, as evidenced by their arrow-heads and spearheads, and as occasionally some of these have been found as far away from the chalk as Crawley they must have had an off-day's hunting and shooting at times. The question how these early peoples lived on our Downs without a water-supply had always been a puzzle, but probably, said Mr. Jenner—as is well-known of South African tribes, such as the Zulus—they

were exceedingly fleet of foot; and thought nothing of moving many miles in a day down to the nearest brook or river. Dealing next with a recently-published book on "Neolithic Dewponds and Cattleways," in which there are references to the Cissbury and Chanctonbury encampments, the speaker said that he did not doubt that dewponds may have existed in neolithic times, but he did not think there was any evidence. Also it was practically accepted that the hill camps he would next refer to belonged to the bronze age. The splendid ramparts at Cissbury had no reference whatever to the wonderful neolithic pits which were scattered widely both inside and outside of the more modern entrenchments. Some of the galleries which were explored some time ago passed right under the southern rampart.

There were many of these camps on various prominent parts of the Downs. They appeared to have been harbours of refuge for the civil population, as well as defences against enemies for the fighting population. They were in every case very cleverly constructed, with outworks covering the contours of the slopes. Cissbury, Chanctonbury, Ditchling Beacon, Hollingbury, Devil's Dyke, White Hawk Down, Seaford, Caburn, Birling, and others might be mentioned, and they seemed to have been placed in positions for easy communication by signalling—as was evidenced at the late Jubilee celebrations by the numerous beacon fires that could be seen from any given point. The ancient paths which lead up to these hilltops are often called borstalls, which is said to be derived from the British, meaning "hill path"; but the hills are covered with ancient paths leading in all directions—mostly grown over with grass—many leading to what is now "nowhere," but which may have been an important place in neolithic times. "Cattleways" they were termed in the book he had alluded to. Perhaps this was right, but not always. There is a very ancient path leading from Brighton to Lewes, and passing over Kingston Hill. It is called the "jugs road"—jugs being the colloquial name for the Brighton fishermen, who travelled that way with their goods to Lewes, &c. There are also natural tracks caused by sheep, which may be seen well on any steep hillside.

There were other marks on the Downs with which he might briefly deal—cultivation marks. They were very evident in many places, especially on the Cliffe Hill, at Lewes, also near Alfriston, and at Littlington. There were also some between Lewes and Brighton. These are supposed to have been caused by the continual ploughing of a furrow—literally beginning at the top of the holding and finishing at the bottom, and they also indicated the beginning of village communities, and what was now understood as allotments. He was inclined to think, however, that this was not a complete explanation. That these early traces, as well as the encampments, should be so evident after the enormous lapse of time was astonishing, and showed the very slow process of aerial denudation. At present Sussex did not seem to possess any early structure analogous to Stonehenge or allied to the solitary one in Kent called Kir's Coty House. But on the Downs at one time were many of the sarsen stones, derived from the strata above the chalk, and stranded at various parts. Many of these sarsen stones might be seen at Stanmer and Falmer, collected from their original sites. He had often wondered if any archaic inscription could be found upon them, such as the well-known cup-and-ball markings.

Having referred to ancient figures cut in the Downs, like the Wilmington Giant, which figures had always been a puzzle, he said there was on the steep slope of the Cuckmere Valley, below Hineover, a very rough cutting resembling a horse which is not recorded in books on the subject, but which was kept clean by youths of the past generation, showing that there must have been some tradition carried down about these things. For himself, he attributed these things to a very early stage of religious culture, but as a fact these hill carvings were mysteries, and they occurred nowhere else in Europe. There was a cross cut on the hillside above Plumpton, near Lewes. Some thought it was a record of the Battle of Lewes, but he saw no reason to think so. He must not omit to say that on the Downs we had remains of the burial-places of the early peoples who lived in the neighbourhood. Most persons who had walked the Downs had come across circular mounds (generally, unfortunately, with a depression in the centre). These tumuli, probably all of the neolithic age, enclosing the remains of some chieftain, were opened with very little scientific accuracy early in the last century. Urns and other things were found in them, but if more care had been

taken we should have learnt more of these early people. There were not many "long barrows" on the South Downs, but there was one above the Coombe, at Lewes, and one above the Wilmington Giant. These were usually supposed to be of the bronze age. He could not discover that anything allied to the dene holes of Kent had been found on the South Downs, unless the filled-up pits at Cissbury are of the same character; but, as the Society noticed a year or two ago, workings very similar were used for raising stone in the Weald of Sussex.

Succeeding the bronze age came the iron age, and iron was in use when the Romans landed in Britain and captured the Downs. Boadicea, we were told, had a chariot with iron scythes on the wheels. When the Romans arrived—those tactical Japanese-like adventurers—they seized the camps and best vantage grounds of the Downs. They ate oysters on Cissbury. The eating of oysters was a peculiarly Roman trait, and from the size of the shells they were not inferior. Traces of their sumptuous dwellings occur at Bignor, at Eastbourne, &c. Their burial-grounds occur at Seaford and in other places. He emphasised the remarkable way in which certain positions had been successively occupied. To begin with, it is a suitable place for a rallying of the savage tribe; after that of the semi-civilised and settled community with their religious ceremonies, on a parish meeting, and possibly a stockade; then, perhaps, the Roman villa of the commander, and after that first the Saxon and then the English church, or the Mediæval castle. In the time of the Saxons the Downs must have been much of a waste, except that their lonely valleys gradually accumulated a house and a barn or two. Before that time they were probably more covered with wood. The iron axe was more potent in clearing than the flint or even the bronze. Within living memory there had been a decrease in trees, but some of the old hawthorns, such as those at the base of Cissbury, seemed likely to live for ever. When we got down to Mediæval times the Downs were still interesting—the perhaps greatest event in English history took place on the Downs, the Battle of Lewes in 1264.

BATH ABBEY RESTORATION.

A MEETING of the Bath Abbey restoration committee, was held on Monday, the Bishop of Bath and Wells presiding. It was reported by the treasurer (Colonel Clutterbuck) that the total funds promised or paid were 2,280*l.*, and that, after paying for the urgently necessary work of strengthening the flying buttresses of the nave, there remained 230*l.* towards the cost of the pinnacles and other contemplated works.

Mr. T. Jackson, the architect, addressing the meeting, explained the unsafe condition of the four pinnacles on the tower and the two at the east end, which was discovered as the result of one being struck by lightning last August, and said the alternatives were—(1) to have no pinnacles; (2) to re-erect the existing ones, resetting the stone, cost 770*l.*; (3) to erect pierced pinnacles of lighter design and of less height, at a cost of 1,900*l.* He submitted a plan, which was greatly admired, of the new pinnacles as proposed, and Mr. E. T. D. Foxcroft moved and the Rector of Bath seconded a resolution authorising the removal of the existing pinnacles and the substitution of those proposed by Mr. Jackson.

The Rev. H. H. Winwood moved an amendment providing only for the removal of the old pinnacles, believing that the tower should first be seen without pinnacles; but he only found two supporters, and the resolution was carried.

A second resolution appealing to the generosity of Bath citizens, visitors and to the country at large for funds to carry out the work necessary to put the ancient and historic church into a state of thorough structural repair was also carried.

TESSERÆ.

Orazio Fontana.

THE one pre-eminent name in the majolica art is unquestionably Orazio Fontana. This really great industrial artist, celebrated in his own day above all others, was the Rubens of enamel painting. It is now possible to identify many of his works, and they fully bear out the assertions of Raphael, that he had no equal in the conception and vigorous execution of his painted subjects, in the invention and distribution of his colours, and in calculating the effect of the fire on his wares. Orazio should be considered rather in his capacity of ceramic artist than in that of a manufacturer of majolica; for his finest works

were most probably produced whilst working as a painter in the establishment of his father Guido. The Fontana were a race of Maiolicari, the art having been practised for generations amongst them. During the great epoch dating from the first quarter of the sixteenth century to the later years of that century, the family "botega" in Urbino seems to have successively been in the hands of Nicolo, Guido, Orazio and perhaps Camillo Fontana. The establishment of Guido, who was the father of Orazio, Camillo and another Nicolo, however, appears to have been the most famous. It was carried on probably from about 1540 till at all events 1565 by Guido and his sons conjointly, but in 1565 Orazio separated from his father and established a "botega" or pottery of his own, the father probably continuing his own separate establishment for a longer period. In 1571 Orazio died, and we have no evidence to show what became of his establishment. It is generally possible to identify the wares of this family or school with sufficient certainty, but it is only in comparatively rare instances that the pieces can be positively assigned to the respective establishments or individuals.

Roman Theatres.

The earliest theatres at Rome, as at Athens, were mere temporary buildings of wood, removed when the immediate occasion for them was over. Stage-plays were first introduced A.M. 391. For 200 years the Romans continued satisfied with standing room; for in the year 599 the Censors Valerius Messala and Caius Cassius, wishing to build a permanent theatre, were prevented by the senate at the instance of Scipio Nasica; and at the same time an order was made that no person should provide seats at public spectacles within a mile of the city, "that the manly habit of standing, combined with mental relaxation, might be the peculiar mark of the Roman people;" or according to Tacitus, "lest, if the people sat, whole days might be spent in idleness." Mummus, the destroyer of Corinth, transported the furniture of the Corinthian theatre to Rome, and at his triumph represented plays in the Grecian manner, for the first time, about the year 610. The first permanent theatre was built by Pompey and finished in 699. Up to that time the ædiles or other persons who exhibited theatrical amusements constructed edifices on purpose, at an enormous expense, and with such splendour as would have seemed meant to hand down the name and magnificence of the founder to the latest posterity, instead of serving merely for a passing pageant. But money lightly earned is generally prodigally spent; and extreme magnificence in works of ornament is seldom consistent with the happiness of those at whose expense in reality they are constructed. The immense wealth which supplied these costly entertainments was the fruit of unjust conquest, or the spoils of subject provinces, and was thus prodigally lavished merely to obtain favour in the people's eyes, and procure other and more lucrative appointments. Celebrated above all others are the theatres of Scæurus and Curio, which are minutely described by Pliny, and will show how far the prodigality and splendour of ancient Rome surpassed all that modern extravagance has ventured or modern means supplied. Pompey's theatre was constructed after he returned from Asia at the close of the Mithridatic war. Plutarch says that, stopping at Mitylene on his way home, he attended some dramatic representations there, and was so much struck with the building that he determined to erect one on the same plan but with greater splendour at Rome. It was not completed until his second consulship in the year 699, and even in that luxurious age either the ancient jealousy of permanent theatres still remained, or he was afraid of raising envy and prejudicing his popularity by giving his own name to so magnificent and proud a structure, for he built a Temple of Venus Victrix, the Conqueress, at the highest part of the cavea, and dedicated the whole to her, stating in the edict by which he summoned the citizens to the dedication that he had built a temple to Venus, "under which," he said, "I have placed tiers of seats to behold spectacles." It would contain 40,000 spectators. Subjoined to this building, and as it were a part of the establishment, were his own house, a portico, basilica and curia. It was in the latter that Cæsar was slain, after which it was shut up. It was splendidly ornamented with statues by eminent artists; among them were the images of fourteen nations, those perhaps whom he claimed to have conquered. Near it in later times stood a remarkable colossal statue of Jupiter, erected by the Emperor Claudius. Being injured by fire in the reign of Tiberius, it was repaired by Caligula, and was again burnt and restored by Claudius. It was burnt

a third time in the reign of Titus. Nero gilded the scene, the theatre and everything employed in the performance to make an exhibition of his magnificence to a royal visitor, Teridates, king of Armenia; the very awning was purple, studded with golden stars.

Wren's Mortuary.

Why the great architect's remains should be placed in such a humble and obscure spot as the crypt of his cathedral is not generally understood. There is a belief that the lines of the building do not correspond with those of Old St. Paul's. Although he destroyed every vestige of its splendour, yet the cross engraved on his gravestone is supposed to suggest that he was not a great enemy of the service celebrated in the former building, and the spot where his ashes rests corresponds with the position of the high altar of Old St. Paul's. John Carter, the architect, has stated that Wren's heart is enshrined in the intersection of the perpendicular and horizontal portions of the cross above the dome. He derived the tradition from his grandfather, who died in 1780, being then 102 years of age, and was known to Wren as well as to men employed in the erection of the building. The selection of so lofty a position sometimes occurred in Mediæval buildings. When the capstone of the spire of Salisbury Cathedral was removed in the early part of the nineteenth century a similar relic was found.

Early Conductors.

Buffon and Dalibard, at his suggestion in 1752, appear to have been the first persons who drew lightning from the atmosphere by means of pointed rods of metal. In the following year M. de Romas elevated a paper kite to the height of 550 feet for the like purpose; this was about twelve months before Dr. Franklin, without any knowledge of what had been done in Europe, performed the like experiment in America. The object of the French philosophers was merely to obtain by those means electrical sparks or flashes of fire; but it is to Dr. Franklin that the world is indebted for the idea of raising pointed rods in order to secure buildings from the effects of atmospheric electricity, and the recommendation was immediately adopted both for edifices on land and ships on the water. Soon after the first employment of conductors in Europe, an opinion prevailed that when their extremities were pointed they created a danger which did not exist before, and that they attracted lightnings which would, without the rods, have discharged themselves at a distance; and in order to diminish the risk, it was proposed to crown the summits of the rods with knobs or balls of metal. This notion was entertained by the Abbé Nollet, in France. In the Royal Society of London the question concerning the relative efficacies of pointed and knobbed conductors was agitated with great vehemence, chiefly through the obstinacy of Wilson, one of the Fellows, who, in 1778, made himself the head of a party in support of the latter kind of conductors, in opposition to the president. It is remarkable that both George III. of England and Frederick of Prussia placed themselves on the side of the opponents of Franklin; the first king giving the preference to balls over points, and the other, while he consented to have conductors raised on his barracks and powder magazines, prohibited the erection of them on his palace of Sans Souci. It is now admitted that the prejudice against pointed rods was entirely without foundation: those conductors have been found not only to protect buildings when struck, but also to diminish the number of shocks which in a given time they have experienced. An experiment which was made by Beccaria, in 1753, might have shown the superiority of pointed conductors over those with balls; for that distinguished electrician set up on the roof of the church of San Giovanni, at Turin, a metallic rod bent near the top and terminating in a point; the upper part was capable of being turned round by means of a silk line, so that the point could be directed upwards or downwards at pleasure, and the lower part of the rod terminated upon substances which were imperfect conductors of electricity. On directing the point towards the sky when a thunder-cloud passed over the church, electrical sparks issued in abundance from the foot of the rod; but when the point of the rod was reversed so that the bend was upwards, few or none were obtained. The conducting-rod set up by Professor Richman, at St. Petersburg, may be said to have been the cause of his death (in 1753); but the house would most probably have been struck if there had been no conductor. The immediate cause of the melancholy accident was that the rod led into the apartment, and the unfortunate professor was standing too near its lower extremity.

NOTES AND COMMENTS.

THE annual report of the medical officer of health for the City of London is always an important document. The City is now expected to atone for the past by giving such attention to sanitation as will be a guide and an encouragement to other municipalities. During the past year there was no incident to disturb the public mind, and the number of cases of infectious disease was the smallest recorded. Baths have been provided for the tenants of the artisans' dwellings in Houndsditch, and during eight months they were used upwards of 7,000 times. The valuation of the City is over 5,000,000*l.*, and with so large an amount of taxable property the City authorities should be able to undertake many sanitary improvements. It is curious that stables are to be found not only in the basements of buildings, but upstairs on first floors. They are all well kept, and the horses seem to be in excellent condition. There are thirty-six bakehouses in the City, twenty-seven being underground. During the year 203 inspections were made, and with four exceptions there was conformity to the standard required by the Act. Greater attention is given to the kitchens of restaurants, and 706 defects were remedied last year. Dr. COLLINGRIDGE has an arduous task, but it is evident that his labours are producing satisfactory results, although the Courts in some cases have not given the support that was desirable to sanitary proposals.

THE loss of Baron ALPHONSE DE ROTHSCHILD will be sincerely regretted by many classes of people in France, for, apart from the services he was able to render the country of which he was a naturalised citizen as a monarch of the world of finance, he was, as an individual, a benefactor to people of various classes. Artists especially must think of him with gratitude. The majority of patrons are intermittent in their purchases of pictures or statues, but with Baron ALPHONSE DE ROTHSCHILD the acquisition of pictures was conducted with as much system as directed his other duties. Every year he made it a rule to buy several works from the two Salons. He used as much discrimination as if he were engaged in speculation, but as a rule he gave the preference to works by young artists in which there were indications of genuine ability. His purchases were all made over to provincial galleries, and consequently proofs of his generosity and discernment are to be seen in all parts of France. His interest in art afforded him one of the chief pleasures of his life. He was a member of the Académie des Beaux-Arts since 1866, and he was one of the most assiduous of the Academicians at the periodical meetings.

WHEN it was lately announced that M. PAUL DUBOIS had resigned the direction of the Ecole des Beaux-Arts, and was to be succeeded by M. BONNAT, French artists and amateurs quickly concluded that the sculptor must have been seriously ill. M. PAUL DUBOIS was so well fitted by nature and training for his position, he would not have abandoned it unless he was convinced that he could no longer do justice to the students. The news of his death will therefore cause general regret in France. He was of the old school of artists, and was never happier than when at work in his atelier. He was born in 1829, and studied under TOUSSAINT. It was not until 1858 that he was admitted as pupil in the school which he directed till a few weeks ago. It was in 1863 he exhibited in the Salon the charming statue of *St. John the Baptist as a Child*, which at once captivated all visitors. It might be said that his figure of the Precursor and M. RODIN's are at the two extremities of the modern scale of sculpture. Two years afterwards his *Florentine Singer* appeared, and was immediately popularised. His masterpiece is the tomb of General LAMORICIERE in the cathedral of Nantes. The soldier made his reputation in Algiers, but he did

not accept Imperialism, and his defeat as commander of the Papal Zouaves made the end of his life a martyrdom. Statues of Charity, Meditation and Faith, as well as one of Courage, are placed near his reclining figure. He also produced an equestrian statue of JOAN OF ARC now at Rheims, and a noble figure of MONTMORENCY, which is at Chantilly. His paintings are so excellent, there can be no doubt that if he devoted himself to that branch of art, he would be no less successful than in sculpture.

FROM what is reported by one of the Consuls of the United States in China, the people are not in favour of the erection of large factories like those which are common in Japan. The "fung shuey" or doctrine of the "wind spirit" and "good luck" has a direct bearing upon the situation. It is believed that tall smoke stacks and high buildings interfere with this "wind spirit" and bring bad luck, and it is safe to say that no ordinary attractions of investments will lead the average Chinese business man into doing anything to conflict with his belief. The Consul suggests the use of gas-engines, and Stockport would, no doubt, be able to supply them. The majority of the mills which exist in the country were erected by the aid of British capital. It is anticipated that when the Japanese are able to turn their attention from war they will endeavour to demonstrate the advantages of the factory system under different conditions.

IN 1903 an exhibition of old miniatures was held by the Royal Hibernian Academy in Dublin. About a hundred examples were shown. Regret has been expressed that no illustrated record was prepared before the dispersal of the collection. Sir THOMAS DREW says that an Hibernian Academy issue of about forty illustrations by collotype process selected from that exhibition is now practicable. As another collection is unhoped for it has been suggested that some other owners of Irish miniatures might be considerate enough to offer them for addition to the forty examples ready for publication. It is very desirable that more examples of such fine Irish artists as COMERFORD, the HONES, CHINNERY, COOKE, ROBERTSON, ROACH, O'REILLY, LAMONTS, J. PETRIE, BURTON, and of fifty or more with names in the old catalogues, should be revived memories. The same care as before would await miniatures entrusted to Sir T. DREW, and with no contingent risks of public exhibition.

CATHEDRAL SERIES.—ST. ASAPH: THE ALTAR.

THE difference between the chancel of St. Asaph's Cathedral at the time when Sir GILBERT SCOTT undertook the restoration of the building and that which is now seen is very remarkable. In 1780 there was a renovation of that part, and plaster vaulting and a wonderful cornice were supposed to impart new beauty to the most important part of the structure. There were massive pews on both sides which were continued into the nave. The fine east window was filled with tracery of a nondescript character. Sir G. SCOTT made a resolute change, and although some may lament the loss of details which might have been designed by a village carpenter, the chancel is now more suggestive of a building which has had so long a history. The windows are memorials of Bishop HUGHES, Dean BONNOR, who was the moving spirit in the restoration, and Mrs. HEMANS, the poetess. The roof is of oak panelling, and the pavement is of tiles and Anglesey marble. The reredos is of alabaster and represents the procession to Calvary, and the altar is of carved oak.

ARCHITECTURE AND ITS PLACE IN A
LIBERAL EDUCATION.*

PART I.

ARCHITECTURE: SHOWING ITS CONNECTION WITH HISTORY.

THE connection between architecture and the humanities is one of the most entrancing and interesting of subjects, inasmuch as throughout the ages architecture has been the mirror of the history of each period, and has been an index of the social and political condition of the people, swayed by those great religious and historical events which serve as landmarks in the history of mankind. As we glance along the perspective of past ages we can find in the buildings of each period a lithic history which tells us of conditions of existence perhaps more truthfully than those written by men in more perishable materials. Architecture then may be said to be inseparable from and the result of history, because the work of man in each period is before us as we look upon the mighty structures of past civilisations. By studying the book of architecture we can tell of the condition, hopes, fears and the very thoughts of the peoples of bygone days as certainly, if not more surely, than by the contemporary written chronicles of each period.

One of the surest tests of civilisation is to be found in architecture, which presents so noble a field for the display of the grand and the beautiful, and which at the same time is so intimately connected with the essentials of life. The painter and the sculptor may display their individual genius in creations of surpassing excellence, but it is the great monuments of architectural taste and magnificence that are stamped in a peculiar manner by the genius of the nation. The Greek, the Egyptian, the Saracen, the Mediævalist, what a key do their respective styles afford to the character and condition of the people.

Prehistoric.—In prehistoric days man in his savage state required but shelter from the elements, wild beasts and human enemies. This he obtained by means of the natural cave, the huts of twigs and "wattle and daub," or the tent of the nomad; and the period between that far-off time and the earliest historic architecture has not yet been bridged by any discovered evolution of form. Architectural history can be divided into two main groups, viz. historical and non-historical.

Let us take the former, which mainly comprises Egyptian, Assyrian and European architecture, and see what it tells us of history, leaving aside the second group, which includes Indian, Chinese, Japanese, Peruvian, Mexican and Saracenic, as these have only exerted a limited influence on European architecture.

Egyptian.—In Egypt we find about 5000 B.C. the first great attempt at permanent constructions. Appropriately is the Sphinx at Ghizeh placed as a sentinel forbidding us, as it were, to know by what long stages of evolution has historic architecture come to life. The Pyramids, built nearly 4000 B.C., represent the governing idea of the Egyptian faith, viz. that immortality could be insured by the preservation of the mummy, secured in such everlasting mounds of masonry, the secret of whose construction even in these days of engineering skill is a wonder to the world. The strong belief in a future state, the powerful priesthood, the significance of the traditional, unchangeable and mysterious religious rites are what we glean from the pyramids, mastabas and rock-cut temples, such as that at Abou-Simbel. Herodotus informs us that the dwelling-house was regarded as a temporary lodging, the tomb being the permanent abode. The temples, their entrances made imposing by splendid avenues of sphinxes, in their mysterious planning, forbidding aspect, as Edfu, and painted hieroglyphics, tell us of the exclusiveness of the Egyptian religion, for they were not places of worship for the people, but rather sanctuaries for the kings and the powerful priesthood.

But these massive buildings would have been impossible without a despotic government and the forced labour of a vast and submissive population of slaves and captive foreigners, probably receiving no other pay than their food.

Western Asiatic.—The architecture of Western Asia tells us that the Assyrians and Persians were a nation of warriors, to whom warlike deeds or the conquest of surrounding countries were more congenial than the erection of stupendous tomb houses. Temples are wanting, sacrifices being conducted in the open air, but the thousands of prisoners taken in battle were employed in raising those

enormous mounds or elevated platforms on which the palaces of Nineveh, Nimroud, Khorsabad, Susa and Persepolis were constructed, a small space being reserved for those temple observatories, in receding coloured stages, from which the astrologer priests could consult the starry vault of the heavens.

Greek.—The architecture of Greece reflects the history of each period with remarkable accuracy, rising to its fully developed artistic height after the battles of Marathon and Salamis, for the national exultation of the Greeks caused by the defeat of the Persians was accountable for the fact that all the more important temples now found in Greece were built in the "fifty years" which succeeded the overthrow of their enemies.

In the Pelasgic and Mycenaean periods the buildings, as shown in the Lion's Gateway at Mycenæ, indicate the ruggedness and severity of the earlier inhabitants, but the Hellenic period introduces us to the most cultured architecture the world has ever seen, which has been a pattern to and has exerted an influence on all subsequent art, so much so that Greece must be regarded as the primary source of the best artistic inspiration, corresponding in a marked degree with her literary pre-eminence. In a climate remarkable for the clearness of its atmosphere, and in a country rich with marble—the most beautiful and monumental of all building materials—the Greeks evolved a type of architecture whose purity of outline and perfection of proportion has never been equalled. National games and religious festivals united them in reverence for their religion, inculcated a desire to erect stately temples, and gave them that love for music, the drama and literature, and that emulation in manly sports and contests which distinguished the race. The most famous and the most refined Greek structures, e.g. the Parthenon, were erected during the rule of the great Athenian Pericles (B.C. 444-29), marking the climax of Athenian prosperity, art and culture, and reflected in those world-famous structures on the Athenian Acropolis. In these the most delicate optical refinements were introduced, and the most perfect and refined sculpture executed during the history of mankind, e.g. the Panathenaic frieze, was employed in their adornment.

The principal Greek buildings are the temples, e.g. the Erechtheion, and these are directly in contrast to those of Egypt in being public as opposed to royal monuments. Instead of the high enclosing wall and mysterious halls of the priest-ridden Egyptian we find the small "cella" for the statue of the god, while on the exterior is lavished all the beauty of column, entablature, sculptured metope, frieze and pediment, brightly treated in many colours. The open-air unroofed theatres, e.g. Epidaurus, in which the plays of the great Athenian dramatists were produced, and the stadia and palæstra, with their lecture recesses, are the practical evidences of the Grecian love for the drama, philosophy and outdoor sports.

The power of Macedonia was paramount owing to Philip and his son Alexander the Great, and the latter in B.C. 334 set out on his great expedition for subduing Egypt, Persia and Northern India. His stay in these countries and the consequent introduction of Hellenic civilisation far and wide throughout Asia is made manifest in the architecture of Northern India, which is specially remarkable for its Grecian purity and for the influence it exerted on subsequent Saracenic styles of art, which a thousand years later were to spring up there.

In B.C. 146 Greece became a Roman province, and her architecture, truthful as ever, died with her as a national style, although, like her civilisation, it continued for a long period to exert an influence upon Roman art.

Roman.—The latter then displaced that of Greece, as did Roman civilisation, and we pass from the simple trabeated style to a complex type of arch, vault and beam, e.g. the tepidarium of the Baths of Caracalla. Roman development was influenced largely by the older Etruscan civilisation of Central Italy, so that in Roman architecture we find the blending of the beam of the Greeks with the arch of the Etruscans. The character and the history of the Romans is well shown in their architecture and the number and variety of their buildings. Temples, e.g. Maison Carrée, Nîmes, were still erected, but of a different type, this being rendered necessary as much for the protection of accumulated Greek spoils than as for Divine worship. In addition to the stately temple, finished and adorned with the finest sculpture, we now find buildings designed for many purposes and of complicated construction. Stately palaces laid out on an immense scale tell us

* A lecture by Mr. Banister Fletcher, delivered before the University Extension Guild at Kensington Town Hall.

of the magnificence and luxury of the Roman court, and the superbly decorated private houses of Rome and Pompeii, e.g. House of the Tragic Poet, of the important character of the "patria potestas," the basis of Roman law. The Roman love of justice is also petrified in their numerous basilicas or courts of law, while their theatres, e.g. Orange, indicate quite a different idea of the drama and its representation from that of the Greeks. The great thermæ, e.g. the frigidarium, Baths of Caracalla, of the later empire indicate the indolence and love of luxury which led to the final decline and fall of the empire, while the amphitheatres, e.g. Pompeii, and the circuses were the natural results of that love for the brutal sports between men and wild beasts, and that coarseness, yet boldness of character, which enabled the Romans to bring the whole of the then known world under their domination. The triumphal arches, e.g. Arch of Septimius Severus, form the permanent expression of Roman power and dominion, and are to be met with in various parts of Europe. The conquering legions of Rome during periods of peace were utilised as unskilled workmen in the formation of the great Roman roads throughout Europe. Further, by the universal use of a new material, viz. concrete, and the employment of the arch, vault and dome, the original architecture of imperial Rome was reproduced in all parts of the empire. Thus the Roman style of building, ever the faithful mirror of Roman civilisation, has been the foundation of all later European architecture.

The Augustan age of literature synchronises with the most magnificent period of Roman art, which enabled Augustus to say that, although he had found Rome of brick, he would leave it of marble.

But a climax was at hand—the end of a great chapter of the art—and Roman architecture and civilisation were displaced with the fall of the Roman Empire.

The new force in the world's history was Christianity, and as all roads led to Rome the very highways which formed the connecting links of the empire could be used for the propagation of the new faith. As Tennyson has said:—

A fuller light illumined all,
A breeze throughout the garden swept.

Early Christian.—In Rome the new religion resulted in the construction of over thirty churches of the Basilican type, e.g. S. Lorenzo fuori le Mura, which was preferred by the early Christians for many reasons, too numerous even to touch upon here. But the new faith was long in developing, and the churches indicate that slow development by the continued use of pagan Roman architectural features and arrangements, slowly modified by degrees to meet the requirements of the new religion.

Byzantine.—Another most important factor was the transference of the capital to Byzantium or Constantinople, resulting in a new style known as Byzantine. Away from the influence of old Rome, the architecture of "New Rome" developed features which were undoubtedly of Eastern origin, although carried out largely by Greek workmen, and of these the dome on pendentives, e.g. St. Mark, Venice, was the most important. This style reached its culmination in S. Sophia, Constantinople, and became the official architecture of the Eastern or Greek Church, which, like the orthodox faith it represents, has been strangely conservative even to the present time.

Romanesque.—How different was the course of architectural development in Western Europe, and how faithful to the changes and development of the Romish Church throughout the Middle Ages. Outside Italy architecture was dormant during the Dark Ages in Europe, for from the break-up of the Western Empire till the time of Charlemagne in the eighth century building was at a standstill. Charlemagne, however, in a great measure restored the arts to Western Europe, and his magnificent tomb house at Aix-la-Chapelle is one of the finest examples of the period. The rise and cohesion of the Gothic nations were a matter of time, and for three centuries (tenth, eleventh and twelfth) cathedrals, of which Durham is a fine example, and churches were erected all over Europe, bearing distinct resemblance to the later Roman architecture, although carried out by the new nations which had been spreading over Europe from the north and east. This is exceedingly interesting, as it shows us how far-reaching and how settled was the Roman civilisation, although the Romans themselves were being driven by the barbarians into their native country.

Till the Western European nations could get out of leading-strings they looked to Rome, but as time went on

they developed their own styles, and the formation of the European States and the religious enthusiasm of the period manifested in the Crusades were most important in giving the necessary impetus to the introduction of the second great type of architecture known as Gothic.

Gothic.—This pointed-arch architecture of the thirteenth, fourteenth and fifteenth centuries in Europe was in great measure an ecclesiastical one, causing the construction of an immense number of important cathedrals, to say nothing of innumerable parish churches. The prominence of the clergy, in consequence of their learning, and the wealth and power of the monastic orders, caused the Church to be the one great avenue for advancement in the Middle Ages, and this, aided by the religious fervour of the times, was responsible for the great outburst of church building at the commencement of the thirteenth century. It is necessary to remember that throughout this period, although militarism was an important factor in the social régime, the builder's art was the great occupation, as the Church was the great profession. The historic development is shown very clearly in these Gothic churches. The priest gives the character of the plain and somewhat ascetic treatment of the Early English or thirteenth-century style—e.g. Westminster Abbey choir; the noble, the more florid treatment of the Decorated period—e.g. Wells Cathedral choir; and the merchant the matter of fact, yet occasional showy character of the fifteenth century—e.g. Winchester Cathedral nave—characteristics which were surprisingly similar in all the countries of Europe.

Gothic cathedrals are very faithful exponents of Mediæval civilisation and Church history. Their place in the national life was all important, for in the absence of printed matter they formed the history books of the period, their sculptures, e.g. Chartres south doorway, and beautiful stained-glass windows, e.g. Bristol Cathedral, reflecting the incidents of Bible history from the Creation to the Redemption, and forming also the grand chronicle of secular history in which kings and nobles, knights and commoners were represented. They took the place now occupied by the school, free library, museum and picture gallery. The worship of relics of local saints—as St. Thomas at Canterbury—the periodical pilgrimages, the introduction of Mariolatry, the necessity of aisles for processional purposes, the introduction of chantry chapels for masses for the dead, e.g. Winchester, Bishop Waynflete's chantry, and other changes of ritual had their influence on church plans and ornamentation.

Another important cause for the extraordinary size and beauty of the Mediæval cathedral was the concentration of the artistic energy of the period on these works instead of being frittered away, as so often happens nowadays, on a variety of buildings.

Mediæval architecture was an evolution of the Romanesque style, and was an architecture of stones in small pieces representing the disintegrated state of European society, instead of the universal concrete of the Romans, thus symbolising in a remarkable way the breaking-up of the Roman Empire into small independent States. The Gothic masons heaped up their small stones in towers that rose on open archways through the lofty roofs of the surrounding naves, and pointing heavenward tapered away in shell-like spires, e.g. Norwich, embroidered in a fretwork of elaborate tracery.

The fortified and frowning castles of the nobles form an eloquent though silent testimony to the feudal system of the Mediæval period and the militarism of which they are the expression, and are exemplified in the cathedrals and castles already mentioned.

Gothic architecture closed with the Mediæval period at the commencement of the fifteenth century in Italy and the sixteenth century in the rest of Europe. It had, like the Mediæval civilisation, run its course, and it was overturned by a succession of historical events which in the succeeding centuries were to alter the face of Europe.

Renaissance.—Looking backward we can see the influences which were slowly paving the way for that great upheaval of art and literature known as the Renaissance, and which, aided by national enthusiasm and the uncovering of Classic buildings which had been buried for centuries, endeavoured, like a bow unstrung, to revert to the old Roman magnificence and ascendancy.

As we should expect, the return to Classic ideals naturally commenced in Italy, and the way for it was paved by the writings of Dante, Petrarch, Boccaccio, and later still Erasmus, who helped to crystallise the revolt against Mediæval thought and art. This was also aided by the newly-discovered MSS. of Greek and Latin authors, of

which the books of architecture of Vitruvius—who lived in the time of Augustus—were most important. Especially was this so in Florence, due in large measure to its commercial prosperity and the enlightenment of the Medici family, and in Italy generally, where Mediæval art had never felt at home in the same sense as in Northern Europe.

But other causes—such as the invention of printing, which aided the spirit of inquiry and diffusion of thought; the discovery of gunpowder, which changed the whole method of warfare; and the mariner's compass, which led to the discovery of the New World—were important factors in the propagation of that freedom of thought and action which characterises the period. One great historical event, viz. the capture of Constantinople by the Turks in 1453, and the consequent influx of Greek scholars and artists to Europe, had an important influence in an age ripe for an intellectual change, and in which it became for a time the fashion to talk in Latin—an evidence of the close connection between the architecture and literature of this period.

But all these influences might have been futile if they had not been sown on fruitful ground, and in a period when such decorative artists as Della Robbia, Ghiberti, Brunelleschi, Alberti, Donatello, Bramante, Peruzzi, Sangallo, Raphael, Vignola, Michel Angelo, Sansovino, the Lombardi, Palladio, and a host of others were as giants in the land. In the Lives of the Architects by Vasari, we learn of the personal influence exercised by the architects and artists on the arts and crafts of the Renaissance period. The character of the architecture as represented in the new churches, e.g. St. Peter, Rome, and the palaces, e.g. the Cortile of the Palazzo della Cancelleria, Rome, and the Palazzo Vendramini, Venice, faithfully reflects all these great changes in favour of the ancient Roman traditions, by the banishment of the Gothic pointed arch, intersecting vault and vertical features, and the employment in a modified form of the Roman orders of architecture, clothing plans derived from the Roman circular dome supported on a square base by means of the Byzantine pendentive.

France, England, Germany, Spain and North-western Europe felt this wave of Roman rejuvenation, though the effect on each country was delayed by the distance from the fountain-head and influenced by various social and political events.

In France, rich with the most splendid piles of Gothic architecture, the new style did not entirely displace the old, but was grafted upon it in a most delightful and picturesque fashion, being mainly utilised in the palaces of the kings and the hôtels de ville and large country houses of the nobility. Amongst examples of these the Louvre, Paris, and Azay-le-Rideau are interesting specimens. The immense number of churches of the Middle Ages long sufficed for the spiritual needs of the people. We cannot justly trace the influence upon France by Italy, unless we take note of the invasions of the latter country by Charles VIII. (1494) and Francis I. in vindication of their claims to the thrones of Naples and Milan, because their return marks the distribution over Europe of Italian artists and workmen such as Leonardo da Vinci, Cellini, Serlio, Vignola, Rosso, Primaticcio, and others who followed in their train.

Many historical events, such as the meeting of Henry VIII. with the French king on the Field of the Cloth of Gold, and the return to England of Italian and French architects, paved the way for the Renaissance in England, which synchronised with the Reformation; while the suppression of monasteries in 1536 caused the diffusion of vast revenues which were distributed amongst the courtiers of Henry VIII. This led to the erection of residences for the new courtiers, e.g. Wolsey's palace at Hampton Court, displacing the obsolete castles of the old nobility destroyed in the Wars of the Roses, and the erection and endowment of grammar schools and colleges which played an important part in the movement, and paved the way for the great literary activity of the Elizabethan era, rendered famous by the writings of Spenser, Shakespeare, Burleigh, and Sir Philip Sidney.

The Elizabethan period, when church building was at a standstill, is notable for the influx of Flemish and German workmen and the immigration of Huguenot craftsmen, due to the massacre of St. Bartholomew in 1572, and is remarkable for its numerous domestic mansions, e.g. Wollaton Hall, the design of which was influenced very largely by this immigration. The newly revived Classical details were used with such caution and delayed by such conservatism, as we should expect of the English character, and the buildings possess many special features—such as

the great hall, e.g. Hatfield; long gallery, e.g. Hatfield; broad staircase, e.g. Blickling Hall; and large mullioned windows, all inherited from the previous periods. The mansions are generally found in a perfect setting formed by the beautiful formal gardens, e.g. Montacute, indicative of the Englishman's love of country life, and are designed on generous lines illustrating the scale of hospitality which obtained in the spacious times of Queen Elizabeth.

The Jacobean architecture felt more strongly the Classical influence, which was not, however, introduced in its purer state till the time of Inigo Jones, e.g. Banqueting Hall, Whitehall, and Wren in the latter half of the seventeenth century, e.g. St. Paul's, London.

At this period many churches were erected in London for the Protestant religion which gave prominence to preaching, thus bringing in galleries and congregational planning in the place of the long drawn processional aisles of the Mediæval period.

In Germany and North-west Europe the Reformation—supported by Martin Luther (1517-46)—accompanied or rather preceded a fresh building era, but with the exception of the period of Charles V., the existence of a number of independent petty states sometimes at war with each other, and each having its own government and capital, prevented any national effort, as in France. On the other hand, ecclesiastical, commercial and municipal buildings tell of the flourishing condition of this part of Europe.

Spain, powerful, owing to her discoveries and vast possessions in the New World, and untouched by the Reformation, was always influenced by the Moorish style of the southern provinces, and even the fall of Granada in 1492, which marks her consolidation and the beginning of the Spanish Renaissance, did not remove the influence of Moorish craftsmen, who gave a special ornamental character of richness, intricacy and refinement to the Renaissance architecture of the country.

Architecture was traditional generally till the nineteenth century, which constitutes the age of revivals of all styles, brought about by numerous causes, not the least being the facility of travel, the ease of illustration and the break-up of traditional schools of craftsmen. Still architecture continues to be a reflection of the thought of the day, of the social needs and aspirations of the people, and an index of the civilising forces at work. Such may be seen in the erection of novel types of buildings—museums, Board schools, public libraries, public markets, hospitals, swimming-baths, drill-halls, colleges, picture and art galleries and scientific and benevolent institutions. It is scarcely possible that architecture may resist all revivals and fashions and develop again into a systematised style, because architects having eaten of the tree of knowledge of all past periods will continue to be swayed as regards mere decorative forms by passing fancies helped by literature and accentuated by sentiment.

I have endeavoured to show that the historical study of architecture has principles and special evidences of its own that enable one to interpret the moral, artistic and religious character of humanity, and that a special insight into the profoundest characteristics of a people is to be obtained by a study of the remains of their buildings, so that the thoughts, habits and instincts of the times are clearly laid bare to us without the possibility of deception, such as is the case by the writings of an inaccurate historian.

(To be concluded.)

EARTHQUAKE-PROOF BUILDINGS.

THE following from Mr. J. H. Stephens appears in *Indian Engineering*:—There has been a good deal said about the late earthquake in all the papers, and its effects on buildings. Its effects on all descriptions of buildings seem to have been disastrous, but more particularly so on those of a more solid character. The rules of the storms seem to apply to earthquakes. The bending willow escapes, whereas the unyielding oak is taken up by the roots. Whether the earthquake be volcanic or tectonic, the effect on buildings seems to be very much the same. Also it is no respecter of persons. It enters palaces and huts and damages both, showing its powers more forcibly on the larger rather than on the smaller constructions. If houses in India could be built in wood they would suffer less by earthquakes. If of rubber or other elastic material they would probably not suffer at all. But what if we could rest the foundations of our buildings on a cushion of

rubber, water, or sand? Would the shock of the earthquake be less?

It has been found that when a building rests on a bed of clay it is liable to continual motion. In the wet weather the clay expands and the building is raised upwards. In the hot weather the clay contracts and the building is lowered. The result is that such buildings, however well constructed, are very much cracked. The clay bed seems to have lines of least resistance, which can be traced for miles in the hot season by open fissures in the surface of the earth. Where a building intercepts such a fissure in the surface of the clay bed there is a large crack in the walls and roof of the building. However good the quality of the construction, nothing can save the building from cracking, and the opening is invariably in line with the cleavage in the bed of clay. In a town like Madras, where houses are pretty near to each other, and the line of cleavage in the clay cannot be traced, it is yet found that buildings on a clay subsoil, however substantially built, invariably show cracks in the walls as the seasons change from hot to dry, and in some cases that the walls also take a slight tilt to one side. This has been going on to my knowledge in several very fine houses in Madras for about twenty-five years without any other harm or danger to the houses. This is due entirely to movement in the clay subsoil.

To counteract this movement in building on clay subsoils in Madras, Mr. Chisholm, Mr. Irwin and myself always went down to permanent moisture in the clay subsoil, filled the trench with 2 or 3 feet of compressed sand, and started our foundations on this sandy bed. Such building, though erected on clay and subjected to all the variations of expansion and contraction in the clay subsoil, yet never cracked. Is this due to the cushion of sand below the foundations? If a cushion of sand can protect a building from the motion due to the contraction and expansion of the subsoil, can it also, in a certain degree, protect a building from the motion due to an earthquake? Do you not think that the matter is worth experimenting on? In Calcutta and in the North generally, where earthquakes have already done so much damage, I am not aware that any attempt has been made to protect buildings or to do anything to mitigate the evil. It is hopeless perhaps to do anything to existing buildings. But I understand that large building schemes are in the air, especially the grand Victoria Memorial. Can nothing be done to protect these? A good cushion of sand has been frequently tried down South, and has resisted the motion in the subsoil caused by expansion and contraction. It is true that this motion is slow compared to the motion in the subsoil caused by an earthquake, but what has done complete good in one case may do a little good in the other. At any rate, it ought to be worth experimenting on. There may be ways of using this or any other material by which half the shock of an earthquake may be averted.

I would like to see this matter fully discussed in your Journal. I do not pretend to know more than others regarding the manner in which an earthquake accomplishes its work of destruction. But after late experiences, I do feel that the whole profession should assert itself, and bring all its varied experience in the past to fight the powers of the earthquake. And if every engineer and practical scientist does his little best in this direction, I am sure that we will succeed. Vibrations in the air, caused by the firing of heavy guns, and its destructive effects on buildings, can be, and have been, in one case, effectively stopped, and similarly, vibration in the subsoil, possibly, can be stopped so far as it effects a building.

MODERN LIGHTNING CONDUCTORS.*

IT has been pointed out by Sir Oliver Lodge that lightning discharges are of two distinct characters, which he has named the A and B flashes respectively. The A flash is of the simple type which arises when an electrically charged cloud approaches the surface of the earth without an intermediate cloud intervening, and under these conditions the ordinary type of lightning conductor acts in two ways: first, by silent discharge; and secondly, by absorbing the energy of a disruptive discharge. In the second type, B, where another cloud intervenes between the cloud carrying the primary charge and the earth, the two clouds practically form a condenser; and when a discharge takes

place from the first into the second, the free charge on the earth side of the lower cloud is suddenly relieved, and the disruptive discharge from the latter to the earth takes such an erratic course that no series of lightning conductors of the hitherto recognised type suffice to protect the building.

On May 28, 1904, a demonstration of the action of A and B flashes respectively was given by Sir Oliver Lodge before members of the committee and others interested in these researches. A thin sheet of metal mounted on non-conducting standards represented the cloud, which was charged at will from a Leyden jar. The "cloud" was so arranged that the model lightning conductors could have their points brought nearer to or further from its under-surface by shifting their positions on the table. Conductors of copper, iron and wet string were experimented with. The disruptive discharge to the copper proved to be by far the loudest and most intense of the three. The iron took the flash with less noise, the wet string with hardly any, yet when the discharge passed through it the other and apparently better conductors were not affected. The experiments tended to demonstrate that iron is in many situations a very useful material for lightning rods, as the effective energy of a flash of lightning is rapidly dissipated in iron. This metal, however, unfortunately oxidises rapidly in towns and smoky districts, and the use of copper is still recommended for main conductors in relatively inaccessible positions as a material for lightning rods.

In Germany two kinds of strokes have been recognised for some time, one as Zündender ("fire causing"), probably analogous to what Sir Oliver Lodge terms the B stroke, while the other, known under the name of Kalten ("not causing fire"), is the ordinary A flash.

The committee [of the Royal Institute of British Architects and the Surveyors' Institution] remark that it is probable that, with few exceptions, buildings in this country are not in reality efficiently protected against the effects of a B flash, although in many cases the lightning conductors may be said to have at least partially fulfilled their purpose by carrying off the more violent portion of a discharge, and without them greater damage would have occurred in many of the cases reported.

Some of these observations throw a very interesting light on the effects due to the oscillatory character of lightning discharges. For instance, a discharge takes place over a lightning rod which may be in contact with, or approach closely to, the metallic portions of a roof. Powerful electrical oscillations are set up in the latter conductors, and dangerously high electrical pressure may be generated on the distant ends of these conductors. If at these points they were connected to earth the pressure would be relieved and the discharge harmlessly dissipated. Without this safe path the discharge may break away into the down pipes, or may pierce the roof to reach internal conductors. Cases which appear to indicate successive or simultaneous flashes may be due to a single flash setting up these oscillations.

In some cases the damage done to a building by an A flash is not necessarily due to the primary discharge. A lateral discharge occasionally occurs, which frequently causes minor, though in some cases serious damage, owing to falling materials.

Many of the reports of damage to unprotected buildings show that the lightning discharge followed the path of wire ropes, metallic pipes and other conductors, and that the damage to the structure occurred at the breaks in continuity at the upper and lower terminals respectively.

It may be considered that a lightning conductor of the ordinary type, if properly constructed, affords an undefined area of protection against A flashes, but it cannot be said to have any protective area against B flashes.

Absolute protection of the whole of a building could only be assured by enclosing the whole structure in a system of wirework—a contrivance, in fact, of the nature of a bird-cage. This should be well connected at various points to earth, as nearly all buildings have gas and water pipes and other metallic conductors in their interiors which are likewise earthed. For structures intended for the manufacture or storage of gunpowder and other explosives, the adoption of this bird-cage protection would be justified on the score alone of public safety. Architectural considerations prevent the adoption of such a method in its entirety for ordinary buildings. There is no doubt, however, that practically perfect protection may be assured by a judicious modification of the existing practice of erecting single lightning rods, especially in the case of extensive and lofty buildings that project well above surrounding structures, or that stand isolated in the open country.

* From a paper read by Mr. Killingworth Hedges, M. Inst. C.E., hon. secretary of the Lightning Research Committee, at a meeting of the Society of Arts on May 24.

The characteristics of a flash of lightning which more particularly concern us are:—(1) Surging, that is due to the oscillatory character of the spark, which, unlike the currents employed for conveying electricity to a distance for lighting cities or driving tramcars, is a disruptive discharge, sudden and violent, more like the blow of a hammer; (2) self-induction, a property which gives rise to counter force or choking effect, noticeable in straight wires, but which is much more pronounced in coils of wire; (3) side flash, the result of self-induction. A disruptive discharge will often leave what would ordinarily be called an excellent conductor and side flash through the air to other much worse conductors; for instance, the lightning rod may be struck, but instead of following the course provided, a side flash may select its own path through a wall of brick or stone to a neighbouring gas-pipe or bell-wire. The often-quoted example of this danger is the accident at All Saints Church, Nottingham, about 1870, when the discharge passed from the lightning conductor through a solid wall of masonry, $4\frac{1}{2}$ feet thick, to a gas-pipe. A photograph appeared in one of the magazines a short time ago showing about twenty oxen lying dead along the line of an iron-wire fence, thus practically illustrating the surging effect of a lightning flash which may cause great damage. That these cattle were killed by a side flash from the line of the fence may be inferred from an incident mentioned at the discussion on lightning conductors before the British Association in 1888. A number of horses placed in a row were struck, the first and last of the row being killed and the others not touched by a lightning discharge.

Unquestionably, wire fences as now constructed serve as death-traps to cattle in many countries. The director of the Iowa, U.S.A., Weather Service, in September, 1898, says:—"These reports show that of the 256 head of livestock killed by lightning, 118 were found in close contact with wire fences, and also that as there were no ground wires to the fences, over 44 per cent. of the losses were caused by contact with the wire charged by a lightning stroke which struck the fence at a considerable distance from the point where the stock was killed."

A later report mentions that a number of deaths have occurred to persons who have been, during a thunderstorm, placing or removing clothes from the wire which takes the place of the clothes-line in the Western States.

The principal causes of the failure of the usual style of lightning rod, as fitted on the buildings investigated, appear to be due to the following:—(1) Insufficient number of conductor and earth connections; (2) the absence of any system of connecting the metallic portions of the buildings to the lightning conductor, especially the interconnection of the finials, rain-water pipes and gutters. In the author's opinion the frequent damage by side flash from the conductors might be lessened by running a horizontal conductor along the ridge or along the parapets of all the roofs, somewhat after the method which is almost universally adopted in Central Europe.

The lightning strokes may be divided into three classes:—(1) Those where the conductor conveyed a portion of the flash to earth, but the side flash to other unearthened metallic conductors damaged the building; the practice of running the conductor round the projecting masonry, often taking sharp bends, doubtless facilitated the deviation of the current from its direct path to the earth; (2) in several observations a metallic roof of large area received the flash, consequently became highly charged, and the single conductor failed to convey the whole of the stroke, a portion of which took a circuitous path, for instance, through a speaking tube and an electric-bell wire; (3) a flash struck the building at two points simultaneously, a lightning conductor taking one part of the stroke, but damage was caused by the other portion selecting an unprotected part of the roof.

Modern Lightning Conductors.

To carry out the recommendations of Sir Oliver Lodge, who, in his paper read before the Institution of Electrical Engineers in 1889, stated that "sharp bends and roundabout paths to earth should be avoided, and that a lightning conductor detached from a building is safer than one in close contact to it," the author has designed special clamps or hold-fasts, which project from the wall or position where the conductors are run and hold them away from the same, and facilitate the cable being strained so as to avoid the projecting masonry. The conductor is then firmly held by a special grip at the end of the clamp, which only requires one screw. The joints used in the system in order to secure perfect conductivity are made by pouring solder or

pot-metal over the loosely spliced, previously tinned conductors, which are laid in a box that can be used either for two, three, or four-way joints. Similarly, if it is required to connect the cable to a plain point, it is either inserted in a socket or in a box which is fitted with a socket to receive it, and molten solder completes the electrical connection.

Elevation rods are made in a similar way. Here are shown three forms for either tape or rope. The multiple points are not screwed in, as the threads deteriorate with age, and they are liable to drop. Therefore they are secured to the centre point by means of the sleeve, which has recesses in which the points are secured, and the box is filled with solder. If required to be packed, the points are kept closed together, and afterwards bent to shape. The continental practice of running a horizontal conductor along the ridges of all the roofs has been adopted by the author in all the important installations he has specified, with the double object of interconnecting the different elevation rods, which are fixed on the higher points, such as the chimney-stacks, and also to offer a good path for the lightning, should, as is often the case, side flash take place. From this conductor smaller wires are taken to the rain-water guttering, which in its turn is connected to the rain-water pipes, and thence to earth. At Westminster Abbey, and on other buildings where the roofs are very long, aigrettes are fixed to the ridges at intervals, the conductors passing through them.

The above is a description of existing practice, but it is quite possible to shield a building in a very different manner by the use of iron wire; a suitable size is seven strands known as a seven ply galvanised cable about $\frac{3}{8}$ inch diameter. Here is some of the material, and as it is very cheap, one may use a lot of it and more nearly approach the ideal "bird-cage" advocated by Clerk Maxwell. If economy is an object, air terminals or elevation rods need not be used; the vertical iron conductor is carried up so as to project above the various chimney-stacks and pinnacles or points, and can be opened out so as to present a number of points. The general appearance of a building protected in this manner is shown by the slide which represents a pumping station and chimney-shaft. In actual practice the wires which form the cage over the building will hardly be noticed from the ground level. The number of barbs shown in the slide can be modified; in fact, where there are many finials, or if there is iron cresting it would only be necessary to have a few points on a horizontal wire which runs along the ridge, and this can be either armoured by twisting round it short pieces of steel wire; the lower legs will keep the conductor away from the roof. A more durable way of holding the conductors is by means of a special device which the author has designed for use in almost every position where stranded wire is employed. You see that it is a triangular, malleable casting, furnished with a spike when used horizontally; the lower legs can be turned over to grip the ridge of the roof or be fastened to the lead flat, and for vertical conductors the same casting does without the spike. A simple and efficient method of joining the cable to the casting is accomplished by a specially designed lead ferrule, which is inserted and closed up by a tool; it can also easily be removed if the system has to be disconnected.

In all cases where rain-water pipes are used as conductors, care must be taken to bond the joints, so as to insure a good electrical connection, that is, if one does not care to risk the cracking of the sockets which form the path of the discharge.

Continental System.

With the exception of Belgium, where the Melsen system of having a network of copper conductors over the buildings, connected at the roof to a number of copper rods made up in bundles of eight and spread out like a feather, is often employed, iron is the material in general use.

In France the standard rod or tige is 6 metres high, the diameter at the base about 0.060 metre, tapering to a sharp point; this rod is firmly connected with the ironwork of the roof, and the iron down conductor is fixed at the base. Usually the tige is connected to the horizontal rod which runs along the ridge or round the eaves, being kept away about 18 inches from the roof. The down conductor is sometimes of stranded iron cable, but more often a solid rod three-quarters of an inch to one inch in diameter, bolted together at the joints.

The earth connection is often made by leading the rod into a well. In one form in use in France surface is obtained by plaiting up galvanised iron strips so as to form

a basket which contains a sort of grapnel attached to the conductor, the basket being filled with coke.

The German rules of the *Electrotechnische Verein* may be summarised as follows:—

"Special attention is drawn to the fact that the conductors of the buildings must be in metallic connection with the earth, and that they ought to go round the building, especially round the top of the roof, and, if possible, on all sides of the roof, and then lead to the ground in the shortest possible way, avoiding all sharp curves. Metallic parts in the building and masses of metal, especially those in contact with the earth and offering large surfaces, are to be connected together as much as possible and to the conductors. In order to decrease the cost, consideration should be given to utilising the pipes upon the building, and all metallic parts should be made use of where possible. Conductors of iron are generally used, and should have a sectional area of not less than 50 square millimetres if interconnected, and not less than 100 square millimetres if unconnected. If the conductors are of copper half these sections is sufficient. All connections to have a metallic contact surface of not less than 10 square centimetres. Conductors must be repeatedly tested."

Many local boards in Prussia insist upon lightning conductors being fitted on public buildings, such as schools, town halls, hospitals and churches. The regulations vary with the different local authorities. In Frankfort the municipality have the following:—

"The erection, alteration and repairs of lightning conductors must be in accordance with the scientific rules now in force. The conductors must be of pure copper, and of not more than seven strands. House-owners must have their lightning conductors examined at least every two years, and an examination is also required in the case of the erection of or alterations or repairs to a lightning conductor which has been struck. Designs and specifications of proposed erections must be submitted to the local board, and for the accuracy of the same the house-owner is responsible."

How to Protect a Building.

Before going into the question of what accessories in the shape of lightning conductors are to be erected, it is necessary to study the disposition of all the external metal-work—the material of the roof, the finials and all ordinary guttering, flushings, rain-water pipes and connections, drain ventilators, telephone, electric and bell wires. Having made a rough plan of these, arrange that the conductors are run from the highest points to earth; but in the case of a church, where the vertical conductors arrive at the main roofs, a horizontal conductor must be placed, so that besides being in connection with those from the tower, it runs along the ridges of the roofs, whence it is connected to all salient ironwork. From it descend other conductors, which are connected to all the guttering and rain-water pipes. In many cases these can be used as down paths to earth, but it is well in the case of a building of considerable area also to run the branch conductors direct from the roof to the earth.

As regards air terminals, it is not absolutely necessary to let these project much above the highest points. If there are many chimneys or spires, each should have a pointed rod, and for a church or other long roof aigrettes fitted to the horizontal conductors which run along the ridge are advisable, in order to discharge the electricity which will accumulate during a storm all over the building and be collected at many points on the roofs.

Earths.—No rule can be given as to the number required; it greatly depends on the nature of the soil. For instance, a church on the top of a hill on hard limestone would require a great many more earth connections than one in a valley. An earth to be of use must be of low resistance; that is, only obtained permanently in moist ground, and if this is not easily obtainable the best way to keep the earth connection damp is to run a small pipe from the nearest rain-water pipe in such a manner that some of the rainfall is diverted directly to the metal plate which forms the earth.

This portion of the lightning rod has hitherto received the least attention mainly because architects and others have drawn their specifications so loosely. Here is an extract from one recently sent me which referred to some large schools:—"The conductor to be connected at base to a copper earth-plate 3 feet by 3 feet and 1-16 thick, buried 6 feet deep in earth at a distance of not less than 8 yards from the wall at base."

Nothing is said as to where the earth-plate is to be

buried, or whether the soil is rock or chalk; the consequence is that one finds earth-plates, almost insulated from the ground in dry weather and quite ineffective. The connection between the copper plate and the lightning conductor is also often faulty; the latter often gets rough usage, and consequently becomes disconnected from the plate. When asked to test an "earth," I generally pull the conductor, as in several cases I have found it disconnected entirely.

At St. Paul's Cathedral the conductors had been originally laid in a brick sewer which passed round the building; this became unused, and was consequently left dry. When I discovered them some were placed inside and others were outside the drain pipes which took the place of the sewer, and were quite insulated and consequently useless. The example is not quite so bad as the one in a northern city where the conductor was insulated in a ginger-beer bottle, which had been duly buried to act as an earth. The cathedral is surrounded by the foundations of the previous structure, which rendered it difficult to make a deep enough hole for a plate earth; this led to the design of the tubular earth, which has now been largely used. This is made in two sizes, and consists of a strong perforated steel pipe, either 1½ inch or 2 inches diameter, and furnished with a sharp spike, which will cut its way through chalk or gravel. At St. Paul's Cathedral it was easily driven through the broken stone which marks the site of the previous structure, destroyed by lightning long before Benjamin Franklin's discovery of the lightning rod. The end of the tube having been protected by a thick driving-piece, which is screwed on temporarily, it is easily sunk by means of hammer or mallet, and if there is an obstruction the pipe is moved by a bar inserted in the holes of the driving-piece. Lengths, connected by a special form of socket, are added until moist ground is reached. The conductor is threaded through the cast-iron top piece, and dropped to the bottom of the tube, which is filled with finely granulated charcoal. An electrical joint between the conductor and the cast-iron top is now made by pouring lead or pot-metal into the socket through which the conductor passes, and tamping it in the same way as if it were the joint of a water-pipe. The earth connection is now complete; but, in order to make it permanent, and to keep the moistness which is essential, a small piece of pipe is led from the special hole in the casting either to the nearest rain-water-pipe, or, if this is not available, it is allowed to project above the ground, so that water can occasionally be poured down. The cast-iron cap is, last of all, inserted on the top of the tube, and serves to mark the position of the lightning conductor—a useful precaution, as conductors are often cut by workmen who have no idea of their existence. The system of tubular earth is favoured by architects, who naturally object to the deep holes necessary for the usual earth-plate being made near the foundations of a building; it also has the advantage of being considerably cheaper than other forms of equipment.

I will now put on the screen a view of a cemetery chapel at Thirsk which was struck in April 1900. It is an unprotected building, but was quite in the shadow of the large parish church of St. Mary's, which had a lightning conductor. You will see how the flash divided over the building, and where it ran to earth there are small upheavals of the ground. In this case the stroke divided up and earthed itself fairly quietly, but in some cases—there is the one of St. Paul's Church, Bedford, which you have seen—the great destruction which took place then was occasioned by there not being adequate earth connections to take the flash, which spread all over the roof.

This slide represents a ground plan of St. Paul's Cathedral, and the lines running to the various circles are the conductors running to the numerous earths. Originally I found that the dome alone was protected and the west towers. To shield the building more completely a conductor was run all round and furnished with aigrettes, as shown by the small circles, and from this the main down conductors ran to earth and others upwards to the various pinnacles and statues.

The Lightning Research Committee received reports from Germany, also from Hungary, where Dr. Moritz von Horn, of the Royal Joseph Polytechnic University, strongly recommends barbed iron wire, and states that cage lightning conductors are largely in use, both on town buildings and on farms and barns. A very interesting report has quite recently been received from Dr. Van Gulik, of Haarlem. It was made at the request of the Dutch Academy of Science. He also favours the use of iron for conductors,

and suggests that the high terminal rods should be abolished. Tables are given to show the number and extent of disasters to protected and unprotected buildings, and particulars of the rebate allowed by some insurance companies where buildings are fitted with lightning rods. The total amount of damage by lightning in Holland settled for by insurance companies is given as 84,000*l*.

United States.

A visit paid by the author to the eastern cities and Canada was reported to the Lightning Research Committee as follows:—

"The general opinion was that owing to the very inefficient protection which had been afforded in the past by the contractors who had installed lightning rods on many public and private buildings, it was gradually dropped out of architects' specifications, and at the present time few new buildings are protected at all. They are often struck, but as the insurance policy covers the loss little notice is taken, although deaths occur either by direct stroke or from chimneys or masonry falling. I was informed that the present conditions were thought to be unsatisfactory, and that architects and engineers generally would like to be advised as to what protection they should adopt. That large amount of damage by fire caused by lightning does take place is shown by the reports of the fire commissioners. The action of lightning when striking those high steel buildings known as sky-scrapers is peculiar, and is worth investigation, as examination does not show in what direction the current flows to earth. In many cases in New York the buildings are insulated from the ground by the fact that the foundation is blasted out of the rock which forms the island on which the city is built."

A slide is shown which illustrates a portion of the framework of a steel building. The author recommended that the roof should be in good electrical connection with the framework and the top, and that the supporting columns should be interconnected at their base by conductors which were led to a number of permanent earths.

Subsequently I went to Canada, and on the day after my arrival in Toronto a severe storm took place, which caused several fires from gas ignition, and a flash struck the tower of the fine modern City Hall, shattering the roofing and doing considerable damage. No lightning conductor was installed, but as I was asked to give my opinion, I think the building has been protected in the way I recommended.

The Lightning Research Committees.—Practical Suggestions.

It is interesting to note that the English committee are not alone in attaching great importance in this matter. Their general conclusions agree closely with the independent reports of the various continental authorities and committees, some of which have been quoted above, therefore the following suggestions are put forward as not only the results of their own investigations, but also as the practical opinions of all those who have been similarly engaged.

The suggestions appear in the report of April 10 as follows:—

"1. Two main lightning rods, one on each side, should be provided, extending from the top of each tower, spire, or high chimney-stack by the most direct course.

"2. Horizontal conductors should connect all the vertical rods (a) along the ridge, or any suitable position on the roof; (b) at or near the ground line.

"3. The upper horizontal conductor should be fitted with aigrettes or points at intervals of 20 or 30 feet.

"4. Short vertical rods should be erected along minor pinnacles and connected with the upper horizontal conductor.

"5. All roof metals, such as finials, ridging, rain-water and ventilating pipes, metal cowls, lead flashing, gutters, &c., should be connected to the horizontal conductors.

"6. All large masses of metal in the building should be connected to earth either directly or by means of the lower horizontal conductor.

"7. Where roofs are partially or wholly metal-lined they should be connected to earth by means of vertical rods at several points.

"8. Gas pipes should be kept as far away as possible from the positions occupied by lightning conductors, and as an additional protection the service mains to the gas meter should be metallically connected with house services leading from the meter."

It is hardly necessary to repeat the rules drawn up by

the committee, as they are set forth at length in their report, which gives some of the details necessary to carry out their suggestions. Some of those which were issued by the Lightning Rod Conference in 1882 are retained, and the new recommendations are principally the horizontal conductor on the ridge or summit of the roofs, and the down conductors, which are connected to this and to all metal-work, and again interconnected near the ground level. The necessity of increasing the number of the earths in proportion to the ground area of the building is also pointed out.

The insurance offices appear to disregard the question of adequate protection, and are quite content if the single conductor, which has not prevented serious damage, for instance, to a church, is replaced, and, moreover, they take no steps to have the earth connection tested periodically. The few unconnected lightning rods erected on our national museums, picture galleries and other public buildings, contrast most unfavourably with the more scientific methods adopted on the Continent, more especially in Germany, where in some districts the local authorities have issued rules as to the erection and testing of lightning conductors, to which the various public bodies have to conform. In some cities householders are subject to penalties if the system is allowed to get out of order.

It appears anomalous that large sums of money should be spent on the protection from fire of our museums, while the question of protection from lightning is simply ignored by the department in whose care they are placed. For instance, the Victoria and Albert Museum has one conductor (it was struck in 1900, but fortunately the damage was confined to the destruction of an electric main, which served as a lightning rod, as it was laid on the wall separating the Imperial Institute from the museum). The National Gallery apparently had no conductor until the flag-staff was erected, and this is the only approach to safeguarding the building from lightning stroke, although many thousands are being spent to buy up the adjoining property. How very differently public buildings are treated abroad is shown by the view of Le Faculté, one of the public buildings in Paris, and of Notre-Dame Cathedral. The British Museum authorities rely on the copper roof for protection, and the flagstaff was on my visit unprotected. The Tate Gallery appears to have inadequate lightning conductors, and the system on the Houses of Parliament, originally installed with great care, is said to require attention (the Victoria Tower was struck in 1868). The ecclesiastical authorities are, with some exceptions, indifferent, and having had some rods put up haphazard suppose that they act as a fetish or charm, or as a quack specific to cure all lightning plagues. I have visited some dozen cathedrals in the provinces, and in only one was there any attempt to protect the whole of the structure, and that was at Canterbury, where the arrangement of the conductors was faulty, in that a stroke of lightning which had travelled through perhaps half a mile of space would not, as the generality of lightning-conductor makers expect, tractably follow the copper tape, some of which had almost right-angle bends. However, Canterbury stands at the head of the other cathedrals which were inspected, in that the conductors had recently been overhauled and re-jointed and the earth connections tested.

At Chester the conductors were insulated and led into loose sockets close to the ground, so that any passer-by could disconnect them from earth. Time will not allow a criticism of all the buildings visited, but I must point out that the well-preserved Minster at York had only three conductors, which, according to information received, had not been tested or overhauled for many years. Our cathedrals and museums are of national importance, and if it is found necessary on the Continent to have a thorough system of protection and frequent inspection, surely it should be done here, as the initial expense could be spread over a number of years, and the annual upkeep would be sufficiently provided for by a 1 per cent. rate on the sum spent for structural repairs. The amount of damage to property by lightning stroke is enormous. Unfortunately, owing to the reluctance of the insurance companies to publish details, no figures can be stated. Most people think that almost every church has a conductor, whereas not 10 per cent. are so provided. In fact, although there is sometimes a recommendation from the archdeacon that the churchwarden should put up a conductor and see that it is kept in order, if the vicar wishes to safeguard his church the cost usually has to come out of his own pocket. The insurance offices do not seem to care whether a building is protected or not, as no individual office likes to insist on the erection of lightning conductors for fear of diverting business to its rivals.

EXCAVATIONS IN ROME.

SIGNOR BACCELLI, a former Minister of Education, who did a great deal for archæology, complained during the debate in the Chamber of Deputies on the Education Estimates (writes the Rome correspondent of the *Morning Post*) that too much is being spent on the Forum excavations and too little on archæological investigations in other parts of Rome. "The present director of the Forum excavations (Commendatore Boni) must be made to understand," said this critic, "that for the present it is not necessary to seek for the mouse-holes of prehistoric mice." The criticism is too severe; but perhaps undue prominence is being given at present to prehistoric discoveries rather than to those connected with the Royal, Republican and Imperial periods.

UNIVERSITY OF WALES.

THE Council of the University College of South Wales and Monmouthshire have issued an appeal for subscriptions to the funds for the new buildings, the foundation-stone of which is to be laid by the Prince of Wales on June 28. The whole building scheme, according to the plans of Mr. W. D. Caröe, F.S.A., will cost 234,000*l.*, to which is added a capital sum of 46,800*l.* for maintenance and 10,000*l.* for furnishing and fitting, making a total of 290,800*l.* It is proposed, however, to defer for a long period the construction of a great hall included in the plans, thus reducing the proposed expenditure to 251,500*l.* The site, which is valued at 25,000*l.*, was given by the Corporation of Cardiff. The Council have secured 67,500*l.*, including a grant of 20,000*l.* by the Government, 15,500*l.* from the Worshipful Drapers' Company to erect a library, 2,000*l.* from the Glamorgan County Council for a public health department, 1,000*l.* under the will of Alderman T. Williams, and subscriptions and interest to the sum of 29,000*l.* The buildings are planned in several departmental blocks, and the immediate intention is to proceed with the erection of the block devoted to arts and administration, which, it is expected, will not only exhaust the 67,500*l.* in hand, but involve an additional expenditure of 35,000*l.*

GENERAL.

Lord Windsor, the First Commissioner of His Majesty's Works, wishes to state that the term "Processional Road" has been erroneously applied to the avenue leading from the Queen Victoria Memorial to the Admiralty. The King particularly desires that the historic name of "The Mall" should be retained as heretofore.

An Exhibition of modern works in wrought-iron and copper is now open in the Musée Galliera, Paris.

Mr. Alfred Savill, of Chigwell Hall, Chigwell, head of the firm of Savill & Sons, 39 New Bond Street, architects and surveyors, who died on March 24, left estate valued at 149,812*l.* Legacies ranging from 500*l.* were left to his office staff.

The New Convalescent Home for men at Little Common, Bexhill-on-Sea, was inspected on Saturday by the promoters, the Metropolitan Convalescent Institution. The present accommodation is for seventy-one patients, which will be eventually increased to 118. The building has been erected from the designs of Messrs. Rowland Plumbé & F. M. Harvey. The total cost, exclusive of site, was 19,650*l.* The contract was let to Messrs. Holloway Bros., Lambeth.

The Society of British Sculptors have elected as honorary members Mr. H. H. Armstead, R.A., Mr. Alfred Gilbert, M.V.O., R.A., and Mr. J. S. Sargent, R.A., the following sculptors being elected ordinary members:—Messrs. S. Nicholson Babb, G. Bayes, F. Bowcher Benjamin Clemens, Harry Dixon, J. H. M. Furze, H. Hampton, C. L. Hartwell, H. Montford, P. Montford, A. Bertram Pegram, Sir W. B. Richmond, K.C.B., R.A., Mark Rogers, R. Stark, F. M. Taubman, A. Turner, Oliver Wheatley and George Wilson.

The Northern Polytechnic Institute will receive applications for the appointment of chief assistant in the architectural and building trades department with a salary of 125*l.* per annum until the 19th inst.

Mr. Allison, who is seventy years old and who graduated at Missouri University in 1852, has re-entered the university in order to take a special course in surveying.

Memorial Tablets are to be placed by the London County Council on No. 64 Duncan Terrace, Islington, where Charles Lamb resided, and 31 Baker Street, the residence of Edward Bulwer-Lytton.

Mr. G. H. Willoughby, of Manchester, has been appointed assessor in the competition for the Radcliffe public free library to be erected in Stand Lane. Forty-eight sets of drawings have been received from architects in open competition. The premiums offered were 50*l.*, 30*l.* and 20*l.*

The Improvements Committee of Aberdeen Town Council on Monday resolved to ask Sir Benjamin Baker, the consulting engineer, to visit the city with a view to inspecting Union Bridge and reporting on the proposed widening. The two schemes suggested are to increase its width by granite masonry, or to throw out steel girders as supports to the footway.

Mr. J. P. Fraser, master of Gray's School of Art, Aberdeen since 1885, has now been relieved of the duties of that position, for which he received a salary of 355*l.* a year. He has been appointed assessor in connection with the awarding of diplomas of the school at a salary of 150*l.* A considerable amount of fresh teaching power will be necessary, and for the advanced department two teachers of painting and sculpture will be appointed, at salaries amounting in all to 280*l.* per annum.

Mr. Alfred Drury, A.R.A., has been commissioned to execute a marble bust of the Prince of Wales, to be placed in the Cartwright Memorial Hall, Bradford, the exhibition in connection with which was opened by His Royal Highness last year. The Prince has placed a room in Marlborough House at Mr. Drury's disposal for the sittings.

Mr. H. T. Steward, the outgoing president of the Surveyors' Institution, said on Monday that the Council have been occupied during the year with the consideration of schemes for extending the scope and raising the standard of professional education by bringing the advantages of university training within the reach of such students as are desirous of acquiring systematic training in some of the scientific subjects cognate to their profession. A scheme was agreed on between the Council and the Senate of Cambridge University with regard to scholarships open to students of the Institution.

Lord Reay, at a meeting of the British Academy on Monday, reported the receipt of an appeal to the Government from the British School at Rome, asking for an annual grant of 500*l.* The principals of the school said they felt it would be something to be deplored if the work were crippled for want of a small sum yearly. Assistance from the State would place the school on a level with its foreign neighbours. His Lordship said he was sure the appeal to the Government would have the hearty support of the Academy.

The Essex Archæological Society have passed a resolution expressing great regret at the Local Government Board's proposal to alter the boundaries of Essex, and suggesting that if change is necessary for poor law purposes, it should be confined to that alone, and that the name of Essex be retained.

The Metropolitan Water Board will establish, as soon as practicable, a central laboratory for the examination of samples of water, and appoint a director of water examinations at a salary of 1,000*l.* per annum. The works and stores committee have been instructed to report, after consultation with the director, as to the best available site, and submit plans and specifications, with an estimate of the cost.

The Dulwich Picture Gallery will, by order of the Governors of Dulwich College, be open to the public, free of charge, on Sunday afternoons during the months of June, July, August and September, between the hours of two and five.

The Cardmakers' Company have published particulars of their forthcoming annual competition. The "H. D. Phillips prize," of 10*l.* 10*s.*, is offered for the best special design for the backs of playing cards intended for presentation by the company to its guests at the inauguration-banquet of the master and wardens; while three other prizes of 5*l.* 5*s.*, 3*l.* 3*s.* and 2*l.* 2*s.* respectively are offered for the three next best designs.

Chancellor Espin, in his visitation charge at Chester on Saturday, said one way of collecting money for the Church in the fifteenth and sixteenth centuries was by means of "church ale." In the churchyard, and, he was afraid, sometimes in the porch, the ale was drawn and sold, and made a big profit because it had been given.

The Foundation-stone of the new town hall for Sutton Coldfield has been laid. The architect is Mr. Arthur R. Mayston, and the building will cost 10,100*l.*

THE WEEK.

THE Usher Hall committee of the Edinburgh Town Council are still undecided about the most economical way of realising the intentions of the late brewer. Recently the plans which Mr. MORHAM had prepared were submitted to two experts, Sir ASTON WEBB and Dr. COWEN. Their reports were presented on Monday with one by Mr. MORHAM. It was proposed to dispense with the dome, which would diminish the estimate by 6,187*l.*, or to 4,208*l.* if the space were utilised as a gallery. Sir ASTON WEBB approves of the change and suggests that the cove should be carried round and a clerestory used for lighting. He furnished the outline of a hall carrying the galleries over one-half of the corridor at the gallery level, but the cost would be affected by the extra foundations required for two sides of the building. Dr. F. H. COWEN suggests that the new hall should be made to accommodate from 2,500 to 3,000, including the platform, whereas the hall indicated by Sir ASTON WEBB would give room for nearly 4,000. What is suggested is to restrict the length of the hall in proportion to the width as fixed by the lines of the old walls, adjusting the height correspondingly, by which there would be provided seating accommodation for 3,500. By adopting a closer order of sitting in the area and galleries the hall could be made to accommodate 3,841. The suggested alterations mean a rearrangement of the front elevation. The city architect submitted new proposals for this part of the building. It is estimated that without the dome and having a shorter hall the cost would be 64,800*l.* To this has to be added 13,470*l.* for lighting, painting, seating, &c. The site will cost 52,350*l.*, making a total of 130,620*l.* exclusive of the organ.

SHINGLE may be a local product or derived from a distant cliff, and it is not difficult to determine the origin of the "unnumbered pebbles." They are sometimes a protection to a coast, although not always pleasant to walk on, and much litigation has arisen on account of them. The Attorney-General was this week a party to an action relating to the removal of shingle from the shore at Blackpool, because the public had a right to walk on a cliff which, it was alleged, would be rendered dangerous by the absence of such a protection. The defendant had a contract with the Blackpool Corporation, by which he could remove about 200,000 tons. He was carting the shingle from the front of the Norbeck Estate Company, who sought an injunction. The case was referred to the Board of Trade, and on the report of an inspector an order was issued prohibiting the indiscriminate removal of shingle in large quantities from the foreshore generally. The defendant's theory was that shingle was deposited by the action of the waves, and compensation was in that way found for what was removed. The Judge in the Chancery Court of Lancashire decided that the order of the Board of Trade was to be obeyed.

It is pointed out by the Senior Chief Inspector of Schools in the Southern Division of Scotland that in the building courses of the continuation schools the instruction is too much confined to the copying of drawings, and the students are seldom called upon to exercise their ingenuity and judgment in applying what they have learnt to designing of even the simplest character. We suppose the defect arises from the belief that design is a mystery, or from the subjects proposed, cathedrals, municipal buildings, &c., being so ambitious as to exceed the powers of ordinary students. Another inspector, when referring to the classes in painters' work, such as are carried out in Aberdeen and Dundee, says it is to be regretted that a good

deal of time still continues to be devoted to practising such inartistic and futile developments of the painters' craft as what are technically known as "marbling" and "graining." One would fain hope that the demand for these false forms of decoration may gradually pass away, but so long as craftsmen are encouraged to spend laborious hours in cultivating them, it is to be feared that occasions will continue to be found for their display. The technical colleges, however, might show the way in this matter as they have done in others. In the Dundee Technical Institute there were last year 250 students belonging to the building trades, including joiners, masons, plumbers, cabinet-makers, while in the Heriot-Watt College, Edinburgh, the number was 311, besides 298 students described as architects, surveyors, civil engineers, &c.

THERE is much dissatisfaction in Glasgow concerning the action of the Infirmary Board in respect of the new buildings in Cathedral Square. The Board, regardless of protests, propose to commence the erection of a building which, from its size and character, will dwarf the cathedral of Glasgow, which is one of the most interesting structures of its class in all Europe. There seems to be no power which can exercise any check over the Board. It is beyond all question that by the erection of the new infirmary the architectural effect of the cathedral will be diminished. What adds to the peculiarity of the case is that the infirmary will have six or more storeys, although the opinion of medical experts is in favour of half the number. However, from the first the Board have acted in an autocratic manner, as if in defiance of what is usual when undertaking an important building. A couple of years ago, it will be remembered, there was a limited competition, and the designs were examined by Sir ROWAND ANDERSON. But not one of those selected by him was adopted, and the design which was put forward found no supporters among architects. It is understood that the plans approved by the Board have been submitted to other experts, but their names have not been announced, and any report which they made has not been published. Evidently their own judges are unfavourable to the proposals of the Board.

THE jury of the section of architecture of the Salon have awarded the *médaille d'honneur* to M. CHIFFLOT, who is represented in the exhibition by a drawing showing a restoration of a street in Pompeii. Although three attempts were made by the French painters who exhibit in the Salon, it was impossible to obtain the required number of votes for any one candidate. The *médaille d'honneur* will, therefore, not be awarded this year. Of late years failures of the kind are not uncommon, and they indicate the number of parties among the painters, as well as the want of principles in common when judging works. The sculptors were more successful, the medal having been gained by M. FRANÇOIS SICARD. There is no doubt his success was owing to his statue of GEORGE SAND, which after two years' labour was ready for this year's Salon. M. SICARD is a native of Tours, and the principal part of his education was obtained in the local school of art. The *médaille d'honneur* in the section of sculpture on medals and precious stones, which in France has more importance than elsewhere, was obtained by M. ROTY. He has executed so many State commissions his skill is generally known, and his medals and plaques will be esteemed hereafter as historical portraits. In the section of engraving and lithography the coveted prize was won by M. EMILE-JEAN SULPIS, who well deserved the distinction. It is remarkable that in painting there was no award of the first-class medals. In the section of sculpture first-class medals were obtained by MM. ALIX MARQUET, VICTOR PETER, CHARLES JACQUOT and SEGOFFIN. The first-class medal in architecture was awarded to M. JEAN HULTO.

SIR HENRY RÆBURN.

IF the position of RÆBURN among British artists is to be determined by the advance in the prices paid for his pictures, then that position must be in the front rank. On Saturday last his portrait of Lady RÆBURN, which in 1878 was sold for 610 guineas, was bought for 8,700 guineas. His contemporaries, it may be remarked, would not admit that he was able to represent the beauty of womankind. The portrait of himself, which in 1877 was valued at 510 guineas, on Saturday reached 4,500 guineas. For another portrait, which so recently as 1887 was sold for 200 guineas, on Saturday 3,600 guineas had to be given. Those prices are not to be taken as evidence of the discovery of an unknown master. NORTHCOTE, who was a portraitist and was familiar with all that was done by REYNOLDS, considered that RÆBURN's style was the happiest of the time, and in that opinion other authorities would agree. The criticism was not inspired by good-fellowship, for, although RÆBURN was a Royal Academician, he was not intimate with English painters. In fact, during the whole course of his life he only paid three visits to the Metropolis.

One of the peculiarities of RÆBURN was that his style was essentially his own. He was not only self-taught, but in his earlier years he had not the advantage of seeing good paintings, and he seemed to work by instinct. He was born in 1756, a time when there was much depression in Scotland. He was the son of a manufacturer, who was of good family. When he reached the age of six he lost both his parents. Fortunately, he obtained entrance to HERIOT'S school, and there he remained until he was fifteen. Perhaps it was owing to the influence of tradition in the school concerning the founder, who was a goldsmith and a royal favourite, but when HERIOT had the chance of becoming an apprentice he preferred that trade to all others. It would be interesting to know what were the conditions to which he was bound. The majority of modern goldsmiths are not metal-workers, and RÆBURN'S days were more likely to have been spent in a shop in Edinburgh than among craftsmen. He must have had time at his disposal, because he was able to make attempts in miniature-painting, inspired, no doubt, by examples which came to be mounted or which were left for sale. His master was not annoyed, but, like a shrewd man, realised that so much ability could be useful to himself. He introduced his apprentice to DAVID MARTIN, a portrait-painter and engraver, who, after experience in London, had returned to Edinburgh, where he at once gained success. At such a time he could have few rivals. MARTIN welcomed so promising an aspirant, and his kind and encouraging words were never forgotten by RÆBURN. He was inspired to adopt a bolder style in his miniatures, and as a report of his merit got abroad he had orders for at least two portraits every week. After a time he was able to agree with the goldsmith for the cancelling of his indentures.

Anyone who looked at the portrait of RÆBURN which was sold on Saturday, and which reminded Sir WALTER SCOTT of some figure of JUPITER, could not fail to conclude that he was endowed with courage, tenacity and foresight. The firm mouth and chin, the watchful, steady eyes, the thoughtful expression, would have served for a ruler of men. On ceasing to be an apprentice he resolved to do more than paint miniatures. Why should he not produce portraits in oil as well as DAVID MARTIN? It is true there was no teacher or friend to reveal the usual practice in painting heads on canvas. The elements were to him a mystery, and it was only by a course of failures he discovered the art of laying on colours. He was poor, and the same canvas must have been used for many experiments. He had recourse to MARTIN, who favoured him by lending him some of his own portraits to copy. But no explanation was given about the production of effects. MARTIN is not to be blamed. Foreign artists are amused at the secrecy which prevails in English studios,

and communicativeness is a rare virtue at the present time. Besides, in the eighteenth century any man in MARTIN'S position would have concluded there was no patronage enough in Edinburgh for two artists, and where was the obligation to help a competitor who was not even a pupil? RÆBURN was too strong to be kept back. He succeeded in making copies of MARTIN'S pictures, and the elder painter went so far as to accuse him of selling one of the copies. With a high-minded young fellow like RÆBURN that was sufficient to put an end to their friendship.

RÆBURN continued to produce miniatures, but the power that was seen in his attempts in oils was sufficient to persuade sitters to prefer portraits on the larger scale. MARTIN'S style was less vigorous, and therefore was not so well adapted for the representation of Scotsmen. In spite of all obstacles, RÆBURN by the time he had attained his twentieth year had succeeded in making a position for himself in Edinburgh, and there was competition for his services. But he was too shrewd to overestimate the value of his works. He continued to be a student as if with the hope that he might attain the versatility of the Italian masters. In his twenty-second year he married a lady with a fortune and then he sought the realisation of one of his dreams which was to study in Italy. At the time Sir JOSHUA REYNOLDS was supposed to be the best adviser in the country. RÆBURN had recourse to him and, as was to be expected, was recommended to study in the Sistine Chapel. It is sometimes supposed that REYNOLDS was selfish in giving such counsel to portraitists, for TITIAN was better adapted as an exemplar. In the case of RÆBURN, the President was likely to be sincere, for he offered to advance the money which the young Scotsman was likely to require while studying in the Vatican.

On visiting Rome RÆBURN found his countryman GAVIN HAMILTON, who painted classic subjects as well as portraits. Indeed, Rome to him was a home, and the greater part of his life was spent there. He was able to introduce RÆBURN to whatever was worth seeing. He also met JAMES BYRES, the architect, a man who received much abuse from BARRY, but who was competent to give good advice to students. Among other things he told RÆBURN never to copy any object from memory, but from the principal figure to the minutest accessory to have everything placed before him. RÆBURN esteemed the words as if issued from an oracle, and throughout the whole of his career he acted upon them. He was therefore a realist, and every detail which we see introduced in his portraits can be considered as authentic.

On his return to Edinburgh he selected George Street in the New Town for his painting-rooms, and by the time he was thirty-one he was admitted to be the foremost painter in Scotland. He was systematic in everything. He lived in suburban Stockbridge, but he walked into the town and was ready to receive a sitter at nine o'clock every morning. As a rule he retained them for only an hour and a half. The self-taught artist had no timidity; he never chalked-in outlines, but boldly commenced with brushwork. His hand was so steady it was not necessary for him to employ a maul-stick. He expected to be paid for his portraits on their delivery. Each work, therefore, became a ready-money transaction, and as there was no necessity to keep accounts no list is forthcoming of the numerous portraits which RÆBURN produced. Collectors will have to be careful in obtaining evidence of the genuineness of examples.

It was a time of a great intellectual awakening in Scotland, and RÆBURN was fortunate in having many of the most distinguished of his countrymen as subjects. Among them were DUGALD STEWART, PLAYFAIR, JEFFREY, ALISON (who wrote on Taste), Sir DAVID BAIRD, MACKENZIE and others. He painted more than one portrait of Sir WALTER SCOTT, and as they have been engraved they are known to all readers of the

"Waverley Novels." One was for CONSTABLE, who at the time was SCOTT's publisher. SCOTT is represented as seated by a ruined tower, with his dog Camp at his feet. It was painted in 1808. "The expression," says LOCKHART, "is serious and contemplative, very unlike the hilarity and vivacity then habitual to his (SCOTT's) speaking face, but quite true to what it was in the absence of such excitement. His features struck me at first as commonplace and heavy, but they were almost always lighted up by the flashes of the mind within. This required a hand more masterly than RAEBURN's." SCOTT in 1808 was known as a poet, and it was allowable for RAEBURN to suggest that he was in a contemplative mood. As a result of a dispute with the publisher, SCOTT wished to obtain the picture and to pay for it, but CONSTABLE declined. At another time SCOTT promised to sit for a portrait which the Duke of BUCCLEUCH wanted for "sweet Bowhill." The Duke suggested one of the failings of the artist when he said:—"RAEBURN should be warned that I am as well acquainted with my friend's hands and arms as with his nose, and VANDYKE was of my opinion. Many of R.'s works are shamefully finished; the face studied, but everything else neglected. This is a fair opportunity of producing something really worthy of his hand." SCOTT excused RAEBURN by saying he had very much to do, and that he had to work for cash, as there were only a few years left to make money. RAEBURN at the time was only sixty-three, but the kindly Sir WALTER had a presentiment that the end was near. When some three years afterwards RAEBURN was appointed the King's "limner and painter in Scotland, with all fees, profits, salaries, rights, privileges and advantages thereto belonging," it was generally believed that he owed his advancement to SCOTT. He enjoyed his office for not more than a year, for he died in 1823. His last work was a portrait of SCOTT.

All who knew RAEBURN respected him. He was a cultured gentleman as well as an artist, and was always ready to aid the younger artists. At one time there was a desire that he should leave Edinburgh for England, but eventually he preferred the Scottish capital, and he avoided London as if he were afraid of it. The admiration for his works was long confined to Scotsmen. But within the last few years there has been a reaction, and it is not unlikely that they will be still more appreciated.

AN ACADEMY RECORD.*

AMONG the men who are referred to by Sir WALTER SCOTT as affording inspiration for his novels one of the most interesting was the mason known as "Old Mortality." He devoted his life to the reparation of the monuments of the Covenanters, and more especially the inscriptions. In his enthusiasm to save from oblivion the names of those he believed to be martyrs for the faith, he abandoned his wife and family. He derived no profit from his labours, and he was destined to die exhausted at the roadside in his eighty-sixth year. By the irony of fate, the man who restored so many monuments lies in some churchyard without a stone to mark the grave of ROBERT PATERSON.

SCOTT was not able to see much of the man, but he could hardly fail to have some sympathy with him, for was not SCOTT himself simply an abler and more successful "Old Mortality"? In his early wanderings in search of old songs and ballads and records, a pursuit which he followed as if by instinct, was he not also endeavouring to bring to light names which were unknown except to a limited few? But are not all archæologists, taking the word in a wide sense, engaged in efforts to restore what has been cancelled and to resuscitate, as it were,

the lives of men who long have vanished? They know that the majority of people feel an interest in men and things which have passed away, and there is a constant endeavour to supply what is desired, although it may only be shadowy.

One of the latest instances of this effort to preserve the reputation of artists is the "Dictionary" by Mr. ALGERNON GRAVES, which relates to exhibitors at the Royal Academy from the first exhibition. It is not, however, confined to painters, sculptors, and architects who are no longer among us, for as it extends to last year a great many of those whose works are recorded are still living. But the greater part of the volume relates to deceased artists, and the author may therefore be considered as rightly belonging to the "Old Mortality" class. We hope he may attain a more satisfactory recognition of his labours.

Catalogues of the Academy exhibitions are prized, and for anyone who has an interest in the history of English art they are valuable documents. But as they were intended to serve for visitors rather than for students who would employ them as historical materials, it is difficult to realise from them the productions of any artist or to perceive the changes in the style or character of the works which he may have attempted. No one, for instance, could have supposed from the fine costume pieces of Mr. Hook that his reputation was to be based on representations of fishing scenes in the South of England. By arranging all the works of an artist in chronological order, as has been done by Mr. GRAVES, we can see almost at a glance the endeavours of artists to express themselves, or the veering which they adopted in order to gain success. Sometimes, too, by the adherence to one class of subject we can recognise that the artist was from the first successful, as happened with Sir L. ALMA-TADEMA, or that he had entered into a contest with the public in the hope that he would finally conquer. The latter case was exemplified in the earlier days of the Academy by JAMES BARRY, the representative of high art. His first painting was *Adam and Eve*; it was followed by *Venus Rising from the Sea*, *Medea Making her Incantation*, *The Education of Achilles*, *Jupiter and Juno on Mount Ida*, *King Lear and his daughter Cordelia*, *Antiochus and Stratonice*, *Mercury Inventing the Lyre*, *The Death of Adonis*, *Pandora*, *Portraits in the Character of Ulysses and His Companions*. There was a *Death of General Wolfe*, but as it was in the Classic style it cannot be considered an exception. BARRY stood alone, and it was to be expected that an artist who believed he was capable of dealing with such lofty subjects should look down with contempt on the men who painted commonplace things and found purchasers for them. But the public were too strong for him, and his fate was a warning to artists who wished to sell their paintings or statues.

It would take us long if we were to comment on the contents of the 400 quarto pages which Mr. GRAVES devotes to the Academy. It will be preferable if we confine ourselves to architecture, following the alphabetical order of the book. Readers will probably be surprised when they find that ROBERT ADAM, whose name is one of the most familiar to English architects, did not contribute a single design to the Academy; whether he sent any there is no knowing. About the time the Academy opened he had erected the Adelphi, and he may have been regarded as a speculative builder rather than an artist. In the early days of the Academy it is evident that designs were accepted of an imaginative kind. The buildings of the time, we suppose, were not deemed worthy of illustration. Between 1801 and 1806 we find EDMUND ATKIN's name attached to the following subjects:—"Design for a Pantheon," "Edifice for British Valour, &c.," "Enchanted Palace, &c.," "Design for Monument," "Interior of a Bath," and "Hall of Venus." An early student of the Academy was DANIEL ASHER ALEXANDER. He was a man who enjoyed an immense practice, including some important

* *The Royal Academy of Arts*. A complete dictionary of contributors and their work from its foundation in 1769 to 1904. By Algernon Graves, F.S.A. Vol. I. Abbaye to Carrington. (London: Henry Graves & Co., Ltd.)

official buildings. But in 1788 he appeared with "A Design of a Temple to Gods," as if that kind of work was imperative. The only subject which he could claim as his own was the "Royal Naval Asylum at Greenwich." THOMAS ALLASON, another student and the winner of a silver medal, sent in 1805 a design for a college, which was followed in the succeeding years by designs for a mausoleum, a Gothic building, a castle and a mansion. The custom continued, for as late as 1821, GEORGE ALLEN, who was a pupil of ELMES, began with a "Villa of Pliny" and a "Fountain to the Marine Deities."

THOMAS ALLOM might be considered as belonging to our time, for he lived until 1872. He began exhibiting as far back as 1827 with a design for Sydenham Church. He was an excellent illustrator, and among his drawings were *Sacred Source of the Ganges*, *Tournament from Ivanhoe*, *The Shrine*. Another architect-draughtsman who, unlike ALLOM, did not secure commissions for buildings, was FRANCIS ARUNDALE. Between 1830 and 1852 he exhibited an immense number of drawings of ancient buildings; in 1838 he exhibited no less than seven unnamed "views." But we expect it would be difficult to discover one of those drawings. ARTHUR ASHPITAL exhibited his church at Homerton in 1845, to be followed by several other buildings of the same class; but he was also allowed to exhibit "A Selection from Palladio," "Ancient Rome," "Modern Rome." Among his designs was a "Wellington Testimonial for London Bridge" in 1853. The name of THOMAS WITLAM ATKINSON is now known mainly by his interesting accounts of his travels in Siberia, the Tartar steppes, and the region of the Amour. But in 1832 and 1840 drawings of his own work were seen in the Academy. WILLIAM ATKINSON was a pupil of JAMES WYATT, and his drawings were sent from that architect's office in Queen Anne Street East. Until 1799, when he exhibited a design for "Hot-houses for the Emperor of Russia," he was living in the Bishop of DURHAM's house in Cavendish Square. In those days the race of patrons had not expired.

When it is remembered how closely Sir CHARLES BARRY was to be connected with Westminster, it is remarkable that his first drawing should be an interior of Westminster Hall. It was in the exhibition of 1812, when BARRY was in his seventeenth year. He was then a pupil of Messrs. MIDDLETON & BAILEY, in Lambeth. That drawing has survived, but his designs for hall, museum and library and buildings in a nobleman's park which appeared in the three following years have perished. In 1816 he was out of his pupilage. As there was no longer a NAPOLEON to interfere with English travellers on the Continent, he left England in 1817, when he visited France and Italy, Greece and Turkey, Egypt, Palestine, Assyria and Sicily. He returned in 1820 and took a small house in Ely Place, Holborn. Mr. GRAVES's catalogue shows in what out-of-the-way places artists used to live in the eighteenth and beginning of the nineteenth century. A drawing of the "Ruins of Thebes" was his contribution to the Academy of 1821, and in 1822 a "Parthenon" and a "Roman Theatre at Djerash." About that time he considered himself fortunate, for he obtained a commission for one of the Commissioners' churches at Campfield, near Manchester, and one at Prestwich. The foundation-stones were laid in August 1822, and he was able to send to the exhibition of 1823, besides the drawing of the "Temple of Theseus," views of his churches at Manchester and Oldham. Those early works kept BARRY in England, otherwise he might have emigrated to America, but he set no value on them as examples of architecture. In 1824 he sent two drawings of a church at Brighton. He was not represented in the exhibition of 1826, but in the following year was a drawing for the "New Spire to the Church at Petworth," which he had restored for Lord EGREMONT. BARRY was now able to move to

Foley Place, near Cavendish Square, and in successive years his subjects were "Drummond Castle," "Trumpington Street," "The Birmingham Town Hall" (a competitive design which was not successful), "A Unitarian Chapel," "Highclere" and "Bridge-water House," which is his most successful Italian mansion. In 1841 he was elected an Academician, and his drawings in the exhibitions of 1842 and 1844 represented the Houses of Parliament. In 1853 were two drawings of the new Crystal Palace, and in 1855 a "Design for Public Offices in one mass." His sons, CHARLES and EDWARD M. BARRY, were able to exhibit in 1850.

ALFRED BARTHOLOMEW, who at one time was an authority on architecture, had only a single drawing in an Academy exhibition—a design for an infant school at Brixton in 1834. GEORGE BASEVI began in the customary way by sending a "Temple of Theseus" to the exhibition of 1820. In 1822 there was a church at Stockport by him, in 1826 and 1828 "Belgrave Square, Hyde Park," in 1827 "New Square, near Grosvenor Place," enterprises which at the time were revolutionary; in 1839, the "Fitzwilliam Museum, Cambridge, which he obtained in competition. He was killed in 1845 while examining the bell tower of Ely Cathedral. HENRY BASSETT gained the gold medal for a "Royal Academy and National Gallery," which was exhibited in 1826, with a "Grecian Doric Church." In 1831 there was a "View of Burton House" by him. Then he was engaged in the Southampton estate office, Fitzroy Square, from which came an "Ideal Composition" in 1839. Between 1787 and 1806 there were several designs by CHARLES BEAZLEY, including a "Triumphal Arch at Maidstone" and a "Pavilion Intended to be Built," &c. His nephew, SAMUEL BEAZLEY, who was dramatist as well as architect, began to exhibit in 1811. Opera houses, theatres and clubs engaged his best attention, his last drawing being "Hillorsdern House," in 1848; the "Lord Warden Hotel," in Dover, was sent in 1846. A drawing by Sir ARTHUR BLOMFIELD of the "Annunziata" in Genoa was in the exhibition of 1856. His subsequent contributions represented his own works. In 1828 there were drawings by EDWARD BLORE of "Goodrich Court" and "Weston Hall," and in 1836 "A Garden Front at Aloupka, in the Crimea." J. BLORE commenced to exhibit in 1841, contributing designs for "A College" and "Gothic Church;" they were followed by "Williams Terrace, Chiswick." He prepared drawings of various monumental shrines, windows, memorials, as well as a sketch for "A Marine Palace at Ramsgate, submitted to Her Majesty in 1839."

JOSEPH BONOMI, the Italian, was among the "ghosts" employed by the Brothers ADAM, who profited by his skill. His first Academy work was a "Design for a Drawing-room," which appeared in 1783. He contributed views of the Pantheon and other Roman buildings until 1789, when he was elected an Associate. REYNOLDS wished to see him elected an Academician, being Professor of Perspective, and because his desire was not gratified he resigned the presidency. BONOMI designed several English mansions in the Italian manner, but London does not appear to possess any building by him, the Spanish Chapel having been removed. He died in 1808, but, strange to say, in the exhibitions of 1809, 1810 and 1811 there were drawings by "J. BONOMI." DAVID BRANDON exhibited between 1831 and 1878, and RAPHAEL BRANDON between 1838 and 1874. JOHN BRITTON was enabled to exhibit several of the architectural drawings which he made for the engravers. The name of BUCKLER, although not as popular as that of BRITTON, is no less associated with old English buildings. JOHN BUCKLER's name will be found in the catalogues as early as 1796, and continued till 1849. JOHN CHESSEL BUCKLER and other members of the family were also liberal in their contributions. J. B. BUNNING, who was afterwards architect to the Corporation of London, had a drawing in the exhibition of 1819 of the "York Buildings watergate." WILLIAM BURGESS's

first drawing was in 1852—"Restorations to Shrine of Edward the Confessor, Westminster Abbey." In 1860 there was a staircase at Gayhurst by him; in 1863 the Cork Cathedral; in 1865 Worcester College Chapel; in 1867 the design for the Law Courts; in 1870 Cardiff Castle and Knights-hayes; in 1872 a house at Cardiff, the memorial church at Skelton and the church at Studley Royal; in 1873 design for St. Mary's Cathedral, Edinburgh, and in 1874 and 1875 designs for the decoration of St. Paul's. In many cases the views which are seen in the architectural room do not suggest the extent of their author's practice. But in the case of WILLIAM BURGESS he might be said to be represented by his Academy drawings. There was the Lille Cathedral and various works in precious metals, but the totality was out of proportion to his genius. It is unnecessary to refer to the works of living architects which Mr. GRAVES has recorded.

There is more popular interest attached to painters' and sculptors' works, and amateurs can find an abundance of pleasure as well as information in going through his pages. A complete set of catalogues may now be considered as unattainable by ordinary individuals, for Americans would gladly give high prices in order to secure them for their public libraries. Mr. GRAVES's volumes will not only give all the information found in the catalogues, including the numbers of the pictures and the addresses of the artists, but it is presented in a form far better adapted for reference than the originals. Those who wish to invest money in pictures will find it suggestive; for, as we know, works of art which a few years ago were not highly valued now realise surprising prices. Many of the works of artists who are almost forgotten may also have their day and be received with cheers in the auction room. For such cases the "Dictionary" may be considered as an investors' guide. That the work should be found in every public library in the country is imperative. But no man or woman who claims to be an authority on English art can dispense with it. It may also be added that blank sheets are introduced for manuscript additions.

ARCHITECTURE AND ITS PLACE IN A LIBERAL EDUCATION.*

(Concluded from last week.)

PART II.

THE PLACE OF ARCHITECTURE IN A LIBERAL EDUCATION.

ARCHITECTURE having thus been shown to be a petrified history of each period, let us look at its place in the educational system of the day, first considering some reasons why a detailed study of its system has not been included in past educational schemes.

It is to be presumed that its absence has been largely due to its technical nature, and to the belief that it was impossible for the lay mind to grasp its forms and the constructive principles of which it is the outcome.

There seems to be no other valid reason to account for the fact that the educational door should have been shut for so long upon so entrancing a subject. But probably a stronger reason was the inability to discuss the subject from the educational point of view, because of the absence of available illustrations. To talk of architecture to the layman without adequate views and plans is like reading a play instead of witnessing it upon a stage, and this lack of illustration, and difficulty of presentment of such as was available, must have been a great deterrent, which in these days no longer exists.

Although architecture has been ruled out of the educational codes of the past, there have always been *dilettanti* who have been worshippers at her shrine, and among modern writers it is well to remember that many, like Freeman and Fergusson, have had no professional education in the art. Whereas in the past many of the world's greatest men and rulers have been builders, or at least patrons—e.g. the kings of Egypt,

Darius, Xerxes, Pericles, Alexander, Augustus, Hadrian, Trajan, Constantine, Theodoric, Theodosius, William of Wykeham, William the Conqueror, Charlemagne, the Medici, Wolsey, Elizabeth, Francis I., Louis XIV., Philip of Spain and Napoleon III.—yet in the later days of art, the patron system and protection of great men having lapsed, owing to the march of democracy and the greater distribution of wealth, the patronage of rulers is wanting, and the democracy not being educated up to the value of art as a national system, architecture has fallen into a state which is not advantageous either for the production of good architecture or national interest therein. Art cannot thrive without these protecting influences necessary for its production.

In the present schemes architecture does not figure on account of the apathy of directors of education, which is, by the way, not their own fault. Being brought up on a scientific code they clamour for the inclusion of geology, mineralogy, astrology and all the other "ologies." The fact that music and singing are also included (although taught in an elementary sense only) accounts for the greater general interest taken in them by the public, and justifies music being termed, as it was by Symonds, the truly modern art. History and literature are also included in modern education, but much human interest is eliminated from both because their joint production, architecture, or the petrified history of each period, is scarcely even mentioned. Yet the work of human hands should be worthy of study, and should give us an insight, not obtainable in other ways, of the thoughts, feelings and aspirations of the men who produced it. The plea put forward here is that the time has arrived for the establishment of a special faculty of architecture, to advance the general study of it apart from its adoption as a profession, and it is regrettable that architecture has as yet no seat within the portals of the great universities. There, if anywhere, we might expect to find that the history of the humanities in past ages should find a protecting roof, and that the student at these great centres of learning should be able to obtain the elementary principles of art in each age. In fact, it seems that these centres should essentially be the places where such education could be obtained, for whereas all over the country scientific and strictly technical education is advancing with rapid strides aided by large grants of money from the public purse, and whereas schools in business and other centres are being erected in furtherance of the forward policy of national education, we might expect that at the ancient universities the wider aspects of life, ancient and modern, should be cared for, and that their protecting wing might include the culture and art of all ages. Architecture is much more worthy of inclusion in a liberal education than a score of subjects one can mention that have secured their position and recognition.

There seems no reason why the technicalities—far less difficult, by the way, than in many of the sciences referred to above—should not be easily mastered by the average student of history, and why a lecturer, imbued with the absorbing nature of the subject and the necessary knowledge, should not invest with human interest what are supposed to be mere dry-as-dust subjects.

The possibilities of the inclusion of architectural history in any scheme of liberal education seem to be rendered easier and more necessary for many reasons, a few of which can be enumerated shortly. The open-mindedness and progressiveness of certain modern educational authorities, of which the London University is an example, has already provided for courses of lectures on various periods of architectural history, and the attendance at these must have shown the authorities that they have provided for a much-needed want, in spite of the fact that the lectures are given without much relation to or co-ordination with the general history of the period, which would add much to their interest.

The present-day facilities for travel have done much to arouse a genuine interest in architectural works erected in past ages, and the personally conducted educational expeditions, which are a feature of the period, are also largely responsible for the desire to know something of the forms of art which are thus brought more prominently before travellers. Photography has also been an important factor in interesting a large section of the community, especially of the travelling and educated public, in matters of art and architectural history, and has caused a desire for a knowledge of the subject which can only be obtained by attendance at lectures in which it is systematically dealt with. The general spread of education in matters of art has caused a yearning for some knowledge of architectural

* A lecture by Mr. Banister Fletcher, delivered before the University Extension Guild at Kensington Town Hall.

forms by those who travel and by the *dilettanti*, unprovided for by any educational scheme yet in vogue.

Perhaps most important of all, the use of lantern illustrations, rendering possible the presentation of the various forms and features of each period to large audiences, has given an added interest, and has awakened an enthusiasm for the subject which could have been produced by no other means.

By the use of photography and by means of lantern slides the art history of any period of which there are examples left can be shown and dealt with serially, because the lecturer's remarks can be illustrated by means of photographs of detail and ornament, and the points of evolution and design made clear, so as to be quite comprehensible even to the least imaginative.

Architecture and the daughter arts of painting and sculpture are unique in representing not only the thought of each period, which is also expressed in the literature, but also the work of human hands, namely, the buildings of all kinds which are the result of brain-power or thought and hand-power or construction.

The inclusion of art in the new scheme of the humanities, initiated by the University Extension Board of London University, is an important step, for the history of any period is incomplete without it, and true art is the grandest work of which humanity is capable. The whole scheme of work is arranged not for professional or technical purposes, but from the point of view of a liberal education.

We have seen what has been the general history of European architecture, and how its various forms were the result of the social and industrial condition and historical events, how intimately connected was the art with the history of the period, and how it was swayed by it. We have also seen why in the past its study has not been included in the schemes of so-called liberal education, and why its inclusion is now rendered possible. We have now to consider the probable results of such inclusion and the benefits which will thus be derived by the community.

The class of persons for whom I am appealing does not, of course, refer to the professional architect, for whom it has long been held necessary to have an intimate acquaintance with the styles of his art in past ages.

It should appeal to every person to whom a liberal education is a necessity, not as a means of enabling him to gain a living, but as fitting him to enjoy to the utmost his daily existence, and giving to him an additional interest in the history of past ages. This includes the travelled and cultured class, and for them each type of architecture must be bound up with the causes—geographical, geological, climatic, religious, social and historical—of which it is the result, and the intimate connection of all these on architecture must be shown more clearly than is possible in a technical course for young students.

Architecture is a sealed book to the majority of people who wander amongst the most beautiful and most soulful creations of the past, and are unable to appreciate either their meaning or their qualities. To them form means nothing, and a Grecian temple, a Roman amphitheatre or a Gothic spire recall none of the conditions which render each a reflection of its own period in history.

Therefore the inclusion of architecture in any systematic course seems essential, and it will give to those who study it, even in a superficial way, a general ground plan of the arts of form and of the trend of humanity in past ages, which is very necessary to a proper and complete understanding of history. It will also give additional pleasure in travelling and an interest in the great works of architecture because of the knowledge which it will give of the place of each work in the evolution of art.

It has become the fashion to know something about pictures, to talk with an air of knowledge about the various schools of painting and sculpture and of the galleries in which you will find them, but has it ever struck you that with a knowledge of architecture the world is your picture gallery, each street is a picture gallery where everyone may enter without so much as the payment of an entrance fee? Then of the buildings, have they not been erected by the general mass of the community in past ages; are they not in the highest degree human, for can we not see the marks of saw and of chisel made, may be, hundreds of years ago, but still telling us of methods of construction, craftsmanship, design and also methods of thought and life? But, in addition, our free gallery of buildings varies with the day and the time of year; sometimes we see our buildings in the haze of early dawn or in the full flood of noonday sun, at others in the dimness of twilight or in the weirdness of

a moonlight night. We want no special lighting for the works of the architect, which form also a setting in their highest flights for the works of sculptor and painter; and in the change of seasons we get that variety which gives them life.

In considering the enjoyment we get from the study of an old cathedral, and the good influence of a beautiful building upon all who pass and re-pass it daily, we must not forget the effect of environment, and the sentiment of age which gives colour, interest and texture to the walls and lichen-covered roofs. By environment we mean not only the position of the building on some specially interesting spot, but the environment of the period in which the building was erected, viz. the history of that period and of the people who helped to erect the structure; for if we study either architecture or history aright we must get into the "atmosphere" of the period. Truly it may be said that history has been to architecture what steam is to machinery, the grand propelling power; and, again, that architecture has been the printing press of all periods.

If there be any one of the fine arts more particularly entitled to the attention of the general student than another it is architecture, because it calls into action so many and such varied branches of mechanical labour, and because, operating thus extensively upon national industry, it also promotes national prosperity. Consequently the dissemination of a taste for it among the middle as well as the more opulent classes of the State is to be recommended no less by sound policy than with regard to more direct and more obvious results.

Is it not therefore time in these days of enlightenment, and in the interests of true as against superficial education, to provide for the study of architecture and its history in the curriculum of the education necessary for every man and woman? Is it not the art that shelters us from the elements, and with which we are brought in daily contact; the art which gives us what we call "home," the art that enshrines and illuminates the most sacred of our associations, forming and fashioning the ornamentation of religion, which it aids by the mystery of its light, shade and colour; the art that has been, and is, the outcome of conditions intimately bound up with the history of the human race? Finally, is it not the art which is the mother of all arts, for from it sprang painting, sculpture, and all the arts and crafts of succeeding ages of development?

No student will ever regret the time spent in the study of such an enthralling subject, for every ruin which he now regards in blank amazement will then tell him of the history of other days, and will enable him to conjure up the character of the men of the period in which it was erected, and will open wide to him the enjoyment of contemplation of form, of which he will then appreciate the meaning and the lesson it should teach.

THE RESTORATION OF IONA CATHEDRAL.

AT the General Assembly of the Church of Scotland last week Dr. Donald Macleod made the following statement on behalf of the Iona Trustees:—Since the trustees stated to last General Assembly what had been done towards restoring the ruins of the ancient ecclesiastical buildings to a fit state for use for the purpose of worship, a considerable amount of work has been undertaken and some very interesting parts have been added to the building. Last year the sacristy was re-roofed, and the arcading between it and the choir has been opened out. Also the north transept has been added to the restored building and the partition between it and the tower has been removed. The whole of the floor of the part now roofed in has been paved. The small window in the east end of the south aisle has been restored. This window is a very unusual design and almost unique in its tracery. The trustees are indebted for the restoration of this window to the kindness of Miss Campbell of Blythswood, at whose expense it was carried out. Arrangements have been made with the convenor of the Highland committee that if his committee are able to send deputies to Iona during the summer the regular services of worship may, with the co-operation of the parish minister, be held in the cathedral. Before this can be done some small further repairs must be carried out and chairs and a reading desk must be provided. To complete the restoration of the parts already roofed in Dr. Honeyman reports that an expenditure of about 250*l.* will be required. To meet this and the balance of the repairs carried out last year, which has been temporarily

borrowed from the bank and other liabilities, about £1,100, is urgently required. Besides this, other things are necessary, but not so urgent, requiring a considerable additional expenditure. The trustees have resolved, if the General Assembly approve of the proposal, to appeal to the ministers of the Church, and through them to the people of Scotland, for subscriptions. The trustees in submitting this statement earnestly request the support of the General Assembly to the appeal above referred to.

Principal Stewart, St. Andrews, moved:—"That the General Assembly are glad to learn that the restoration has proceeded so far as to permit of the arrangements proposed with the concurrence of the parish minister for holding Sunday services in the cathedral during a part at least of the summer. The General Assembly approve of the proposed appeal and wish it all success." The response to their appeal, they must admit, has been so far disappointing. Dr. Donald Macleod had just returned from South Africa, where his appeal had received a very cordial response. The subscriptions he had received amounted at present to between 300*l.* and 400*l.* One of the difficulties they had to contend with in making their appeal was the want of an adequate scheme of some useful purpose to which the restored buildings might be devoted, and he was sure the Assembly would hail with satisfaction the announcement as to the holding of Sunday services. One most useful purpose to which this gift might be put would be that it should be used as a place where ministers in delicate health might get a fortnight or a month's holiday during the summer, with the very slight duty imposed on them of conducting a Sunday service. He was told that it would not take much to make some of the buildings, say, the nunnery, suitable for a residence for the ministers who went there. It was not an act of gratitude to the late Duke of Argyll that the buildings had been allowed to remain so long without the necessary repairs being carried out, and he did think that when the Duke of Argyll entrusted the Church of Scotland with the ownership and custody of these ancient buildings it should not be shown by their conduct that the trust had been in vain.

Dr. Blair, in seconding, suggested that they should have a retreat there not merely for men in delicate health, but where ministers could retire and hold converse with one another, and calmly and quietly, amid the historical reminiscences of Iona, study many questions that affected the Church.

The motion was unanimously adopted.

SOCIETY OF ARCHITECTS.

ON Saturday thirty-six members of the Society of Architects from London and provincial centres spent several hours in touring Liverpool for the purpose of acquainting themselves with most of the places of interest from an architectural point of view. Mr. Walter W. Thomas, who is president of the Society, in conjunction with the secretary, Mr. C. M'Arthur Butler, had made the arrangements for the visit. The itinerary began with a visit to the new Dock Board offices, of which Messrs. F. H. Hobbs & Arnold Thornely are architects. This interesting experience was succeeded by a tour of the docks by means of facilities kindly provided on the Overhead Railway by the engineer and general manager, Mr. S. B. Cottrell. Other places seen included the Hatton Garden fire station, St. George's Hall and the town hall. The visitors, lunched at the North-Western Hotel, under the presidency of Mr. Thomas. The Lord Mayor, who had desired personally to welcome the visitors, called at the hotel, but as they had not returned at the appointed time from the itinerary, his lordship had to leave to fulfil his engagement to accompany the Municipal Officers' Guild on the Welsh coast trip by the steamer *La Marguerite*.

After the luncheon Mr. A. E. Pridmore (vice-president) proposed the health of the President, and expressed the thanks of the party to Mr. Thomas for the excellence of the arrangements which had been made for the visit.

Mr. Thomas suitably responded, and in proposing the toast of "The Lord Mayor and Corporation of Liverpool," conveyed to the members of the Society present the heartiest greetings of the Lord Mayor.

Mr. Turton (deputy surveyor to the Liverpool Corporation) responded.

On the initiative of Mr. Ellis Marsland (hon. secretary) the company toasted the health of all in Liverpool who had

assisted to make the visit the enjoyable success which by all the visitors it was voted to have been.

At the town hall, which was inspected in the afternoon, the members of the party were received by Alderman Willink, acting on behalf of the Lord Mayor, and were entertained to tea.

The visitors took their departure from Liverpool on Saturday evening.

THE WATTS BEQUEST.

THE late G. F. Watts, R.A., after his long career as an artist, had accumulated a vast number of studies besides other works. In his will it was stated that the President of the Royal Academy should have first choice, and afterwards there was to be a division among various galleries throughout the country. As there were difficulties about the interpretation of the clause Mrs. Watts, in order to avoid litigation and in accordance with what she believed would have been his wishes, proposed that some of his works should be given to existing public galleries, and that the greater part of the works should be used to form a collection for exhibition at the gallery at Limnerslease, Compton, Guildford, erected by him. With a view of carrying out this proposition the executors, with the approval of His Majesty's Attorney-General, requested Sir E. J. Poynter, P.R.A., Sir Charles Holroyd, keeper of the National Gallery of British Art, and Mr. Lionel Henry Cust, the director of the National Portrait Gallery, to select such of the late artist's works as in their opinion could suitably be placed in a public gallery for exhibition or study. The committee accordingly made a selection, and a scheme for dealing with Mr. Watts's works based upon its report was, after submission to the Attorney-General, approved by Mr. Justice Warrington on Monday.

The scheme provides that the following works are to be given to the undermentioned provincial galleries:—"Mischievous," to the National Gallery, Princes Street, Edinburgh; "Faith, Hope and Charity," to the National Gallery at Dublin; "Echo," to the Nottingham Art Gallery; "The Recording Angel," "The Court of Death" (study), "The People that Sat in Darkness," to the Manchester Art Gallery. These are some of the late artist's finest works in red chalk. "A Study for the Court of Death" and "Britomart," to the Art Gallery at Norwich.

One hundred and nine works are to be placed in the gallery at Limnerslease, which will be open to the public on at least three days of the week free of charge, and on at least three other days of the week at a charge (if any) of not more than one shilling per person. Mrs. Watts will convey the gallery to trustees for the benefit of the public in perpetuity, and will endow it with a fund sufficient for its maintenance.

The following portraits by the late Mr. Watts will be retained in the gallery at Limnerslease until the time shall arrive, according to the rules in force relating to the reception of portraits by the National Portrait Gallery, for their presentation to that gallery:—Field-Marshal Earl Roberts, K.G., V.C., the Right Hon. Gerald Balfour, the Right Hon. the Marquis of Ripon, Mr. Algernon Charles Swinburne, Mr. James Passmore Edwards, the Right Hon. Charles Booth, the Lady Mount-Temple, Mrs. Josephine Butler, Claude Montefiore, Professor Flinders Petrie, Mr. John Burns, M.P., Mr. Walter Crane, the Right Hon. Cecil Rhodes (unfinished), Mr. George Meredith, Mr. Philip Hermogenes Calderon, Mr. G. F. Watts, R.A.

Mr. Watts's study in gesso of "Physical Energy" will be placed at the disposal of His Majesty's Commissioner of Works, or other proper authority, in order that it may be utilised for making a bronze statue for London, and after being used for this purpose the work is to form part of the collection in the gallery at Limnerslease.

In accordance with a promise made by the late Mr. Watts his picture "Alice" has been selected for presentation to the National Gallery of Art of New South Wales.

The testator bequeathed to his friend Mr. Andrew Hitchens one of his small pictures, to be selected by him; to Mr. George Duckworth a portrait of his mother, Mrs. Julia Leslie Stephens; to Sir Walter Dalrymple, the small portrait of his mother, Sophia Lady Dalrymple; to Laura Lady Troubridge, the portrait of herself in a red cloak; to General Arthur Prinsep, the portrait study of his mother in a red dress; and to Mrs. Florence Maitland, her own portrait.

NOTES AND COMMENTS.

ALL statistics relating to the Metropolis are startling. It might be supposed that the figures showing the traffic over the bridges in London could not easily be approached. But at Woolwich they are no less remarkable. The free ferry was opened in March 1899, and during the three complete years following (1899, 1891 and 1892) it was used by 12,205,474 passengers and 678,152 vehicles. During the last three years (1902, 1903 and 1904) these figures have increased to 15,642,869 passengers and 1,328,624 vehicles. The total up to the end of 1904 is 70,402,853 passengers and 5,806,446 vehicles. Useful as is the ferry, it cannot always be worked. During bad weather and fogs traffic must be suspended. Last year there were 38 stoppages, which must have caused much inconvenience to the working class. The bridges committee of the London County Council are justified in proposing that a footway tunnel about 11 feet in diameter, similar in design to the Greenwich tunnel, should be constructed under the river at the point where the free ferry crosses. The length would be about 500 yards. It would not be necessary to acquire any land in connection with the construction of the tunnel, as the shafts on either side of the river could be sunk under land belonging to the Council, and the local authority, the Woolwich Metropolitan Borough Council, who are responsible for the paving, maintenance, &c., of the land, would be prepared to give the necessary facilities. The total estimated cost of constructing a footway tunnel would amount to about 145,000*l.* The annual cost of the maintenance of the tunnel, including the supply of electric current for the lifts, is estimated at 2,500*l.* It will be necessary to obtain authority from Parliament to carry out the project.

In his annual report Mr. W. L. VERNON, the Government architect of New South Wales, says:—"The composition of the staff of officers of the department underwent, during the year, a very drastic investigation on the part of the Public Service Board, resulting in some considerable changes. I can congratulate myself that the consequent reorganisation retained for me the services of active, businesslike and experienced outdoor officers; a body of draughtsmen which I doubt could be equalled for ability in the whole of the States, and a most competent staff of district architects, whose constant attention in the country districts has enabled the utmost to be done in keeping up the condition of buildings under somewhat adverse circumstances. The number of officers under my control is numerically less than before." On July 1, 1903, there were four first-class architects, seven second-class, eight district architects and fifteen draughtsmen. On July 1, 1904, the respective numbers were three, four, five and ten. That means a reduction in assistants from 9,543*l.* to 7,100*l.* There used to be eighty-one assistant engineers; the number has been reduced to twenty-eight. That means a reduction from 29,265*l.* to 10,745*l.* Instead of having thirty-seven engineering draughtsmen, there are now nineteen. The surveyors have been reduced from eighteen to eight. It is said that as far as was possible "the permanent officers were transferred to other departments where their services could be utilised, but unfortunately places could not be found for all, and many officers who had been in the department for years had to be retired from the service. During the year a complete reorganisation of the country officers, with a view to more economical and efficient working, was made; and in place of having, as formerly, two or three officers in the same town, each representing a separate branch of the department, one responsible officer is now in charge of each district, exercising control of all works carried out in that district by the department. In consequence of this reorganisation, and the dispensing with the services of officers no longer required, the returns for 1904-5 will show a reduction of 439 officers."

Few visitors to the Bavarian Walhalla, unless they are Germans of the old school, can admire the building. It was an effort to realise GOETHE's idea of a combination of Northern and Greek ideas. The tribes who believed in a Walhalla where heroes were to assemble could not suppose it would assume the form of a Greek temple. But KLENZE was willing to serve as an interpreter for the king. He produced an excellent imitation of Greek work, but he could not suggest the furnishing of it. Only very classic people can gaze on the busts without being chilled. The temple, in spite of its style, was not out of place among Germans, especially as in modern times they have endeavoured to imagine themselves as resembling the men who fought against the Roman legions. A Walhalla in Brussels is, however, a different sort of affair. There are a greater variety of uniforms to be seen in Belgium than in much larger countries, but when we think of their warlike deeds there somehow arises the figure of VAN CUTSUM in "Vanity Fair," that sensitive hussar who, like all his regiment, obeyed the colonel and fled from Waterloo. Perhaps the Walhalla which the King of the BELGIANS is about to have erected will testify to victories in Congo and elsewhere. It is to be an imitation of KLENZE's temple, although M. BOUVARD, the French architect, to whom the project is entrusted, would be able to produce a more appropriate design. But why should not a Belgian architect receive the commission, and why is the Flemish style unsuitable? We suppose the Walhalla or Panthéon is to be considered as a national memorial and therefore it should not display indebtedness to strangers. The site of the building is close to the Porte de Namur in Brussels.

THE charming property in the western suburb of Paris known as "Bagatelle" having been acquired by the Municipality, an exhibition of works by English painters has been opened in one of the vacant pavilions. M. CAMILLE GROULT has lent fifty pictures by TURNER, REYNOLDS, GAINSBOROUGH, ROMNEY, CONSTABLE, &c. The subject of one of TURNER's is the Pont-Neuf, Paris. There is also a Venetian scene by him. Although the collection is limited it justifies the preference of DELACROIX, GÉRICAULT and other Frenchmen for English paintings some seventy years ago. The exhibition, unlike the majority of those in Paris, can only be seen on payment of an entrance fee. The money received is to be devoted to the purchase of works of art, which will form a permanent collection.

The result of the elections for Council of the Royal Institute of Architects on Monday was as follows:—JOHN BELCHER, A.R.A., President. Vice-Presidents.—EDWIN T. HALL, HENRY T. HARE, LEONARD STOKES, Sir JOHN TAYLOR. Honorary Secretary.—ALEX. GRAHAM, F.S.A. Members of Council.—W. H. ATKIN BERRY, J. J. BURNET, A.R.S.A., W. D. CAROE, M.A. Cantab., F.S.A., T. E. COLLCUTT, A. W. S. CROSS, M.A. Cantab., ERNEST GEORGE, JAMES S. GIBSON, J. ALFRED GOTCH, F.S.A. (Kettering), E. A. GRUNING, EDWARD W. MOUNTFORD, Professor BERESFORD PITE, A. N. PRENTICE, G. H. FELLOWES PRYNNE, JOHN W. SIMPSON, JOHN SLATER, B.A. Lond., C. HARRISON TOWNSEND, PAUL WATERHOUSE, M.A. Oxon., EDWARD WOODTHORPE, M.A. Oxon. Associate-Members of Council.—R. S. BALFOUR, HENRY A. CROUCH, W. A. FORSYTH, H. V. LANCHESTER. Representatives of Allied Societies.—A. W. BREWILL, G. BERTRAM BULMER, THOMAS COOPER, H. L. GODDARD, M.A. Oxon., JOHN KEPPIE, W. M. MITCHELL, G. H. OATLEY, P. C. THICKNESSE, J. H. WOODHOUSE. Representative of the Architectural Association (London).—E. GUY DAWBER.

MAIDSTONE.

THE first summer ramble of the twenty-ninth season of the members of the Upper Norwood Athenæum was taken under the conductorship of Mr. T. C. Thatcher to the capital of Kent on Saturday, May 6. A good muster of members and friends left town by an early train, and on arriving at Maidstone a brief visit was paid to St. Peter's Church, erected in the thirties on the site of an ancient Pilgrims' chapel, a few portions of which were visible at the east end of the present church. Then the Archbishop's palace was seen, one of thirteen seats of the primate in Kent; three were in Surrey and two in Sussex. Hasted's "Kent" gives a view of as much of the palace at Maidstone as remained at the Dissolution. They proceeded to the beautiful church of All Saints, then to the college of All Saints and the Tithe Barn, an interesting specimen of this class of building, having an external stone staircase like the old toll-house at Yarmouth, a feature sometimes found in fourteenth-century buildings. The interesting Elizabethan building, the former Chillington manor-house, which is now the Museum and Library of the town, was visited. It is a picturesque building, and contains a large and varied collection of antiquities illustrating all periods of prehistoric existence, Roman pottery and leaden coffins, fossils and bones of the mammoth, rhinoceros and Irish elk, portraits of bygone worthies, including Hasted, the historian of Kent, and a good painting by Morland. Amongst other good things are Mediæval weapons and ironwork, a large Natural History collection and the ancient college library, and a valuable reference library of Kentish topography.

At the evening meeting Mr. Thatcher read the following paper:—

Maidstone in Saxon times was called Medwegstun, meaning Medway's town (Russell). Lambarde tells us that in an ancient Saxon book which he had seen on

of bronze and a lamp, both Roman, were discovered, and in 1870 the foundations of a Roman villa were unearthed in a hop garden near Upper Stone Street.

If a criminal sought refuge in All Saints Church he received protection of sanctuary. But the means also existed for effectually punishing offenders against the public peace. The cucking-stool was a frequent source of expense to the town, and the stocks and the pillory were constantly in need of repairs; there was a "cage" for rogues and vagabonds in the High Street, removed in 1654 to a void space beside the Great Bridge stairs.

In Anglo-Saxon times the neighbourhood of Maidstone was the scene of many conflicts, such as the battle of Aylesford, when Horsa and Catigern were slain. This place we visited last autumn. Edmund Ironside, having defeated the Danes at Otford, pursued them as far as Aylesford, where he was victorious.

One of the most notable events which distinguish the place in history was the famous meeting held on Penenden Heath—that is "the place of penalty;" in fact, at this place criminals were executed (it is about one mile north-east of the town)—between Lanfranc, Archbishop of Canterbury, and 'Odo, Bishop of Bayeux, Earl of Kent, brother of William the Conqueror, in consequence of the latter's appropriation of various lands and privileges formerly enjoyed by the Primate, and after a trial lasting three days, Odo, got the worst of it, and had to relinquish twenty-five manors to the See of Canterbury.

In the reign of Richard II., in 1381, Wat Tyler (but whether he was born in Kent or Essex is still a matter of dispute) set up his standard in rebellion. And in the reign of Queen Mary, 1554, Sir Thomas Wyatt took up his stand in the High Street and announced his intention of opposing the marriage of Queen Mary with Philip of Spain, and his principal supporters were landholders from this part of

MAIDSTONE—CHURCH, PALACE AND COLLEGE.

CHILLINGTON MANOR-HOUSE, MAIDSTONE.

the bridge work at Rochester it was written Mægwanstane—"that is to say, the mighty or strong stone, a name (belike) given for the quarries of hard stone there." In Domesday Book the name occurs as Meddestane, the mid-town or town in the middle of Kent. This is Newton's idea. In Edward I. Law Reports it is written Maydenstan, the "town of maidens," and out of this arose the idea of placing a maiden standing on a stone on the old seal of the town. To my own mind the older is the correct meaning, and we may take it to represent Medway's town, considering the frequency with which the Saxons named towns and vills after the rivers upon which they stood.

The locality is claimed to be the site of a Roman station, though not necessarily a military one, yet there is every reason to believe, from its important local position, and from remains which have been discovered from time to time, which you have seen to-day in the Museum, that it was a place of consequence during the Roman occupation. In 1715 several Roman urns and bottles were found at the lower end of Earl Street, urns were found in Howick Lane and at St. Faith's Green in 1819, also, in the same year, part of a Roman shield, a brooch and several coins were unearthed near Wheeler Street. In November 1859 over twenty-four human skeletons were dug up, together with about 150 Roman urns and coins. In 1822 a small image

Kent. His fate and that of his followers is well known. One result was that Allington Castle was forfeited to the Crown. In Mary's time several noblemen and women suffered death by burning for conscience sake in the town of Maidstone. On June 11, 1557, two men and five women were burned at the stake in the Fair Meadow, one of whom was a poor sightless maiden commonly called "Blind Bess." These were all tied to one stake.

Edward VI. incorporated the town under the title of "The Mayor, jurats, &c.," of the town of Maidstone in Kent, a privilege which it forfeited on the occasion of Sir Thomas Wyatt's rebellion. This was restored by Queen Elizabeth in the year after her accession to the throne.

On Thursday, June 1, 1648, Lord Fairfax laid siege to Maidstone. Sir Gamaliel Dudley was governor and Sir John Mayney second in command. It was a desperate battle, the Royalists disputing every inch of the way until twelve o'clock at night; and after five hours' hard fighting were driven into All Saints Churchyard, where they surrendered. Sir John Mayney and 300 Royalists were slain, and Sir Gamaliel Dudley, Sir William Brockman and 1,300 men were captured, beside 500 horses, 3,000 arms, 9 colours and 8 pieces of cannon. A full description of this battle you will find in Clarendon's work, the "History of the Rebellion." In fact, the Parliament estimated the victory

so highly that they ordered a Thanksgiving for it "in all the parish churches of London and Westminster."

Maidstone has had its celebrities:—Ralph of Maydenstan, Bishop of Hereford, died 1245; John de Maidstan, Dean of Lincoln, 1275; Walter de Maydenstan, Bishop of Worcester, 1313; William Newton, the historian of his native town, died 1744; and William Wolleth, the eminent engraver, born 1735.

The Archbishop's palace is on the north side of All Saints, the palace grounds adjoining the churchyard. Newton tells us that the manor of this place, together with the palace or castle, did formerly belong to the family of Cornhill, and so continued till William de Cornhill, desiring to exemplify his zeal and devotion to religion, gave them to Stephen Langton, Archbishop of Canterbury, in the seventh year of King John, or about A.D. 1207. But how true soever this may be of the castle, it is very certain that long before this, in the reign of Edward the Confessor, the manor of Maidstone was owned to be the property of the Archbishop of Canterbury, probably by the gift of one of our Saxon princes. Thus it is entered in that ancient and venerable record called Domesday Book:—"Maidstone is the Archbishop's own manor, and in the time of King Edward defended itself for x plough-lands. And of them Ralph holds one plough-land, which is appraised at 50s., and William, the brother of Bishop Gundulph, holds two plough-lands, and they are appraised at 10l., and Anscetillus de Ross one plough-land, which is appraised at 60s. And two men have thence one plough-land, who render to the altar of the Holy Trinity 16s., and yet that plough-land is worth 20s. This manor has an hundred within itself."

In 1348 Archbishop Ufford pulled down the greater part and commenced the present buildings. They were not completed until the time of Archbishop Islip, who sued the

Sir Jacob Astley (created Baron Astley of Reading), and was alienated by his representative in 1720 to the first Lord Romney, whose successor handed it over to the Corporation quite lately.

The dungeon is a vaulted chamber with a fine groined roof, and where it is said an anklet was found not so long since, and this tells a dreary story of poor prisoners kept in durance vile in olden days. The window is still to be seen where the food for the unfortunates was lowered down. The four walls adjoining mark the site of the prison chapel and guard-room.

Inside the building we have the dining hall, with the raised dais for the prelate; the bishop's robing-room, library and private chapel; and also the entrance to a subterranean and unexplored passage, leading, it is said, to an old house in Buckland, on the other side of the river. But the most curious part of this passage is that it commences on the first floor, and not from the ground floor or basement.

The palace and grounds were secured by public subscription and presented to the borough in 1887 to commemorate the jubilee of Her late Majesty Queen Victoria. The ground floor is now the headquarters of the Royal Army Medical Corps, and I believe the private chapel is given over to musical studies.

The tithe barn, now used as stores and stables, appears to have been a portion of the original offices. The stone staircase on the outside, common to Late Decorated houses, the arched doorways and the moulded windows, all of these are worth our notice.

We will now turn our attention to Maidstone Church, a very fine example of Perpendicular work. "The building is assigned almost completely to Archbishop Courtenay, 1381-96, who, after building the adjoining college, obtained

TOMB, WITH FRESCO, OF DR. JOHN WOOTTON.

FIREPLACE AND PANELLING, ARCHBISHOP'S PALACE.

administrators of Ufford for dilapidations, and, receiving 1,100l., demolished a house belonging to the archbishopric at Wrotham, and made use of the materials for completing the building of the palace. He also obtained the Pope's license to charge his whole province with a tax of 4d. out of every mark, under colour of which his officers demanded and collected a whole tenth towards the building of this house and other like purposes. But Stephen Birchington puts it more plainly:—"But by the craft of his clerks, who only showed to the clergy the said letters in the church of Maidstone without reading them, he extorted from his subjects a full tenth (10th), and had from others of the province of Canterbury only 4d. of a mark according to the Bull."

It was largely added to by Archbishop Courtenay in 1381-96; he also founded the college, and died in the palace in 1396, and Archbishop Stafford is also said to have died in the palace in 1452. The palace was again added to by Archbishop Morton in 1486. King Henry VI. visited it in 1438, and with the great primates of England it continued a favoured residence until Cranmer in 1538 surrendered it to Henry VIII. Edward VI. granted it to Sir Thomas Wyatt, on whose attainder it reverted to the Crown. Queen Elizabeth bestowed it upon Sir John Astley, who died in 1637, from whom it passed to his son, the famous cavalier,

the license of the king (Richard II.) to convert the parish church of St. Mary to a collegiate church, dedicating it afresh in honour of All Saints. The first notice of Maidstone Church occurs in Domesday Book, where we find that about 800 years ago a parish church stood on the same spot, evidence of which was discovered during the restoration, when the piers of the columns in the arcades were found to be resting on massive oval-shaped plinths, which evidently had supported the columns of the original church. This discovery was confirmed by the finding afterwards of some of the tiles that formed the pavement of the original church.

"The entire edifice was designed upon definite and fixed proportions. The nave is 99 (3 times 33) feet long, its width is nearly 93 (3 times 31) feet, the chancel is 60 (3 times 20) feet, and each side aisle of it is 12 (3 times 4) feet wide; the choir proper is also 60 feet long and 30 (3 times 10) feet wide, forming two squares of 30 feet each. Archbishop Benson in 1886 said:—"If you take the plans and examine the dimensions, you would find them written all over with the figure three, undoubtedly with the intention of keeping before men's minds the Holy Trinity and the God whom they worshipped." Thus, too, there are twelve pillars in the nave, six on either side, representing the Apostles, and four in the chancel, two on either side, representing the Evangelists." (Row and Martin.)

The monument of Lord Jacob Astley bears the inscription:—

To the never dying Memory of that
Great Soldier and Person of Honour,
Lord Jacob Astley, Baron of Reading.
Let th' Island Voyage (in the Van) speake forth
Thy youthful Valour, they all-daring Worth.
Next: Newport Battell, where thou didst prefer
Honour to Life; there made an Officer
By famous Orange (thy great generall),
Under whose sword (that day) Spayn's force did fall.
What Cloudes of Nations could I raise for thee,
And each one would a glorious witness bee.
As Holland, Denmarke, and vast Germany,
All grieve thy losse, honour thy Mémoire.
England (thy Mother) crowned thy hoary Head
With Major Generall. Here in Honours Bedd
Thou (now) dost rest. And with more honour than
These times afford unto a noble man.
Faith, Valour, Conduct. All in Souldier should,
Or could be wisht for, this Tombe doth enfolde.
Ao. Dni., 1653.

Obiit, 27 Die. Febyuarri, 1651.

Before the battle of Edgehill (where Sir Jacob was severely wounded) he knelt down and offered up this memorable prayer:—"O Lord, Thou knowest how busy I must be this day. If I forget Thee, do not Thou forget me;" and with that he rose up and cried out, "March on, boys."

In the south aisle is the piscina that marked the position of the altar of St. Katherine. The Arundel chapel is entered by passing through the new carved screen, recently erected by the officers and men of the Royal West Kent Regiment, in memory of their comrades who were lost on the North-West Frontier of India.

In this chapel are many monuments, but the most noted is that to Dr. John Wootton, died 1417; he was appointed by Archbishop Courtenay as the first master of the college. He was master for twenty years, and was also a canon of Chichester Cathedral. Its brasses are gone, but there still exists in the arch above a mural painting representing the Archangel Gabriel presenting the deceased, symbolised by a very diminutive figure in a suppliant posture, to the Virgin Mary, who stands between St. Katherine (with her wheel) and St. Mary Magdalene, while in the distance are the canon's patron saints, each wearing a pall and crowned with a luminous glory. Figures of Archbishop Becket and Bishop de la Wych of Chichester are in the side canopies.

In the centre of the chancel a raised slab has been despoiled of its brasses, but their matrices plainly show that they portrayed a bishop with mitre and crozier. It is the memorial to Archbishop Courtenay, over which so much controversy has raged, for according to the Leiger (or Leger) book of Christ Church, Canterbury, recently confirmed by some discoveries in the Chapter Records, he was interred by the order of Richard II. in the cathedral (where his monument of alabaster still exists, at the feet of the Black Prince), on August 4, 1396, though contrary to the desire expressed in his will that he should be buried in his beloved church of Maidstone. Excavations were made beneath the slab in 1794 by the Rev. John Denne (curate-in-charge), and at a depth of 6 feet a skeleton was discovered, but without any ring or pastoral staff, and from the perfect state of the teeth apparently of a much younger man than the prelate. Mr. Bèresford Hope suggested that his heart may have been buried here, and his body in the cathedral, a custom not uncommon in those days.

Chillington House was originally the Court House of Chillington Manor, which passed from the Cobhams to the Maplesdens, and was forfeited by the latter for their share in Sir Thomas Wyatt's insurrection. Here is the public Museum, containing some good specimens of the birds and fossils of the neighbourhood, and a fine collection of Roman relics, the donation of the late Mr. Thomas Charles, who resided there, and died in 1855. The manor-house itself is an excellent specimen of domestic architecture of the Elizabethan period. Evidence of an older building was discovered in 1871, as some rag-stone jambs and an arch were found *in situ*, the spandrels bearing the initials I. M. and P. M. respectively, probably those of John and Peter Maplesden, who occupied the house about Henry VII. or VIII.'s time. This relic now forms part of the fireplace in the Brenchley room.

In 1343 is the first mention of this manor, then held by the great Cobham family, afterwards by the ancient college of All Saints, and then by the Maplesden family, who, as I have already said, forfeited it to the Crown in 1554. In

the fourth year of Queen Elizabeth's reign it was sold to Nicholas Barham, serjeant-at-law, Recorder and M.P. for Maidstone, for 500*l*. In 1683 it was the residence of Edward Wyatt, serjeant-at-law; in 1801 Mr. William Charles purchased it, and at his death in 1832 it passed to his two sons, William and Thomas. The latter bequeathed his collections to the town, forming the nucleus of the present extensive Museum. The Corporation subsequently purchased the house and garden adjoining. In the reference library are some very valuable topographical works.

The College of All Saints, founded by Archbishop Boniface in 1260, was the hospital for reception of poor travellers and for the special benefit of pilgrims on their way to the shrine at Canterbury. All that is left of this ancient building is to be found in St. Peter's Church. It had fallen so low as to become a store-room, but now it is used again for worship. In 1395 the hospital was incorporated by Archbishop Courtenay with the new college of secular priests, the larger part of which still stands to the south of the church. The buildings still standing belong partly to the Earl of Romney, and are in private occupation.

ALL SAINTS COLLEGE, MAIDSTONE.

They consist of a gateway, a long range of rooms between it and the river, terminated by a tower, and the master's house on the right-hand side. The first master was John Wootton, whose elaborate tomb we have seen to-day in All Saints Church. The college was dissolved about 1538.

In conclusion, I have to acknowledge my indebtedness to Newton's "History and Antiquities," Russell's "History of Maidstone," Hasted's "History of Kent," and Row and Martin's "Kent's Capital." I must also express my sincere thanks to Mr. Downes for his kindness in taking me over the ground and for his valuable advice, and also the custodian of the Archbishop's palace, the vicar of All Saints, and the curator of the Museum for the attention shown; for this, gentlemen, as you are doubtless aware, is my first attempt at a ramble, and under the circumstances trust that you will overlook any deficiencies that appear in my paper, for my great difficulty was what to put in and what to leave out—for this is a subject which deserves to be treated in a far more able manner than I

have done. I have endeavoured to place before you the history of those places we visited to-day in as lucid and brief a description as possible, and if I have given you a pleasant afternoon I am amply repaid.

SCHOOLS OF ART IN SCOTLAND.

SPECIAL reports as to the character of the instruction in various schools of art, by Mr. E. A. Walton, R.S.A., have been presented to the Scotch Education Department as follows:—

I have visited the following schools of art in Scotland, viz. the School of Art, Glasgow, the Royal Institution School of Art, Edinburgh, the Heriot-Watt College art classes, Edinburgh, the Technical Institute art classes, Dundee, and Gray's School of Art, Aberdeen.

On beginning my work of inspection I was accompanied by the officers of the department charged with the special oversight of the science and art work, and at each school I was attended by the director or headmaster. I visited every class, morning and evening, that was held during my stay in the four cities; I interviewed each separate master, gave advice on the particular work of each class, examined the work in hand of the students, and looked at specimens of finished work which were set out for my inspection and criticism.

In this report I have dealt, as requested, particularly with the drawing and painting classes. Before I was requested by your lordships to visit the schools, I had had opportunity from time to time of seeing the working both of the old and new systems of training art students, particularly in the Glasgow School of Art. It is my opinion that the present state of the schools is a great improvement on the past, and if all the classes of the schools were brought into line with the best classes I have seen under the new system, the art student would now be able to receive as designer, craftsman or artist as complete and thorough a training as he could get anywhere at home or abroad. A greater union between the schools of art in Scotland should be encouraged, and I advise that all the masters should visit the different schools from time to time. I therefore recommend that the masters charged with the oversight of the classes for painting and drawing from life and antique should in particular visit the Glasgow School of Art, where I found the system best carried out with regard to these classes.

The excellent collection of architectural casts in the Royal Institution, Edinburgh, should be made more use of, and I would therefore advise that every art school in Scotland should have a complete set of copies of this specially fine collection, also that every school should help as far as possible in spreading copies of its best properties in this way. I further recommend that the masters of the various architectural classes of all the schools should visit that held by the Royal Institution, Edinburgh. There is a very distinct effort being made to bring the Board school drawing-classes for children into closer touch with the system of the art schools; I made it my business when in Scotland to visit two of the Board schools to make myself acquainted with the system employed. I was greatly impressed with this department of general education; I think it augurs well for the future, for every branch of handicraft and learning will be greatly aided by it, and it will materially raise the standard of the art schools. In the art schools themselves every encouragement should be given by the masters to the sketching clubs, as it helps greatly to raise the standard of the students' work and encourage their individuality.

The Glasgow School of Art.

I visited the above school on February 8 and 9. The school is finely equipped and the director is thoroughly alive to all its requirements. The work in nearly all the departments is excellently carried on with much interest and enthusiasm.

The great difficulty in such a school is to keep the students alive and keen, and in the Glasgow School of Art there is very little to find fault with. There were, however, exceptions which I pointed out to the director, and I found that in these cases he had already contemplated certain changes to rectify matters. The Glasgow School of Art takes a first place in the art schools of Scotland, perhaps I ought to except (with regard to its architectural classes) the Royal Institution, Edinburgh. As a consequence of the able management of the school—and in spite of the fine building so lately erected—more space is required. At the

present time many classes are overcrowded, and part of the upper hall or museum is screened off for the purpose of making an extra classroom. The museum is a most valuable feature, and it is regrettable that any of it should be shut off from the general use of the student. I therefore advise that the entire building be completed according to the original plans as soon as possible. But I would recommend that, until the building is completed, the number of students should be reduced by cutting off those who prove themselves to be inefficient, and by applying an entrance test; this would also raise the general standard of the school.

The system followed by the school (in the drawing and painting from the antique and life classes) of teaching the students to draw and paint the figure life-size, is excellent for the more advanced students. It was evident to me, however, from some of the studies, that some of the students were not quite prepared for this stage. As a general rule no figure should be drawn or painted life-size. Half-size is large enough, where the space for working in is within ordinary and reasonable limits, and only when the students are thoroughly advanced should they be allowed to draw or paint on a larger scale. To the student who is making naturalistic studies of the figure on the so-called life-size scale, I should like to point out that the figure should not be life-size by actual measurement on the canvas. I saw excellent studies of the so-called life-size by the students of this school marred by not being on an exact and reasonable scale. As regards drawing from the antique in this school, the work was most thorough in its study, and the result was good, but a freer use of material is required. It seemed to me that the student was more encouraged to use chalk pencils than charcoal, and the result was in some cases a certain amount of mannerism and unnecessary labour was also expended in making pretty shading. Both mediums have their advantages and their drawbacks, but the use of both should be more encouraged, and would, in my opinion, tend to remove these defects in the work.

In the still-life painting classes the same principle of an exact scale in drawing should be adhered to. The student in these classes might also be taught care in the preparation of his canvas and the use of non-fugitive colours. Painting and drawing in the school, excellent as it is in all the different classes, would be materially improved by adherence to the above advice; the student would find himself less hampered by material and less confused by a too complicated palette. The various studies shown me convinced me of the faults arising from the neglect of these principles. In the modelling classes the work on hand was only in a very preliminary stage, and I had no opportunity of seeing any final results.

The embroidery and design for embroidery practised in the Glasgow School of Art are marked with great distinction of style. These classes are doing work of a very high order, and many excellent results are achieved. In spite of much talent displayed, however, the results are not altogether convincing to me. The modern movement of art, as applied to design, has greatly influenced these particular classes, and the fact that the result is not thoroughly convincing seems to me to be because the designs are not sufficiently based on the sound study or direct inspiration of nature as practised in the other departments of the school. When human figures are employed, the fault is most evident; but it is also evident in the designs of ornamental forms. I do not in any way intend to discourage the influence of the modern movement in art work. In fact, I would have it introduced, when possible, in the architectural department of the Glasgow School, but it should work hand in hand with a closer study of nature and of the Classic orders. The movement as applied to design and architecture seems to me to require to go back to first principles, origin, construction, proportion, &c. Further, I should advise that the architectural students studying the Classic orders would do well themselves to go back more to these first principles, as their work greatly requires it.

Edinburgh Royal Institution School of Art.

I visited the above school on February 12, 16 and 17. The school has made a distinct, and so far successful, effort to improve its classes in the last year or two, and it is being brought well into line with the best type of classes I visited in Scotland. It seems to me, however, that in order to make the further necessary advance, the services of an additional master or director are required.

The most successful feature of the Royal Institution art classes seems to me to be the architectural school. There is a certain activity about it that inspires the student. It possesses a fine library and an excellent historical collection of casts of architectural fragments. This department is kept in admirable working order, and as an example would be of great value to the other schools of art in the country.

The present Renaissance of architecture, which has influenced some of the younger Scottish architects, seems not to be recognised by this school. I am inclined to think that the classes might be brought into touch with this Renaissance, on account of its vitality and force, which will have to be reckoned with in the future. Much of the work of this younger school of architects is fantastic, and inclined to run to seed, but bringing this new life into the school would have a good influence on the students, would inspire original work, and make the students of the Classic orders more critical of certain accepted forms, and would also, in my opinion, have a good influence upon the Renaissance itself outside the schools. I may here point out that this is in accordance with my remarks upon the embroidery classes in the School of Art, Glasgow.

In contrast to the architectural gallery the antique gallery gives one a feeling of great surprise. The collection of casts is excellent as a whole. Some additions, however, might be made with advantage, but the gallery itself is in shocking order, and would demoralise any worker by its dingy character. I therefore strongly advise that this particular gallery be redecorated immediately, roof and walls coloured a light tone and a number of the casts cleaned under the direction of a sculptor. Some other classrooms in the building seem to be almost in a similar condition, and no time should be lost in having this matter attended to. Apart from this serious defect, which is bound to exercise a deteriorating influence on the work of the students, the system of teaching drawing and painting seems to me to be excellently carried out. I should strongly recommend, however, that the life classes be held daily.

Advanced students should be encouraged to make life-size drawings and paintings of the figure, and I should like to point out that there is an exact scale upon which the student should base his drawing. I found the students in this school using a simple palette to good effect.

The modelling class in this school is good and carried on with considerable life and enthusiasm. The bookbinding classes are well directed by a thoroughly skilled craftsman, employing good and sound designs. The class for technical and ornamental design is well carried out, and very good work of a high order is done. I have only one suggestion to make regarding the work of this class, viz. that although many of the designs are directly inspired from nature, still more thorough study could be done in this direction with advantage to the students.

Edinburgh Heriot-Watt College School of Art.

I visited this school on February 15 and 16. The school is worked on excellent lines, and the staff of masters over all is good; an extra master, however, is, in my opinion, required for the more advanced work, so that the present headmaster could have more time to supervise and act as general director. In the classes for drawing and painting from the antique and life I found the work reached a high standard. In my estimation, however, the amount of drawing from the life attainable by the student, though it may meet the requirements of designers and craftsmen, is quite inadequate for the requirements of the artist student. I am fully convinced that such a student should have opportunity given him to draw and paint from the life every working day of the week, and in his more advanced stages he should devote at least six hours a day to this study.

Advanced students should be encouraged to make life-size drawings and paintings from the figure, and I should like to point out there is an exact scale upon which they should base their drawings.

The modelling classes in this school are doing good work as far as they can go, but they should be encouraged to make more use of natural objects to design and model from. A life class for modelling is urgently required, and if an extra room cannot be secured for it at once a draped model for the study of the head should be arranged for immediately. It is advisable also that the modelling student should have access to a collection of architectural fragments such as those in the Royal Institution School of Art. There are no architectural classes in the art school. This department is classified with the technical and science

classes of the college. This might be kept as it is, but it is a well accepted fact, and one that should not be lost sight of, that architectural students should work in the general classes of an art school, drawing and modelling from the antique and life. The study of natural objects in this school, and the illustrations and home exercises, showed very good results.

Dundee Technical Institute Art Classes.

I visited the art classes of the above Institute on February 9 and 10, and I find that they are of a very limited character. The department for ornament study and designs for textiles is the most active, and some very good work is done by it. The elementary principles of pattern planning, the analysis of simple patterns, and repeating designs, plant forms and their adaptation to purposes of design are well studied. The architectural class is practical, and good work is done by it. The principles and the history of architecture seem to be well taught. The limited character of the school retards the very good efforts made by the classes I have mentioned. The life class is only held one day in the week, and, owing to want of space, the antique figures are put aside to make room for elementary studies. With regard to the work of the life class and the classes for drawing and painting from the antique and still life, the students should be encouraged to make life-sized drawings and paintings, and I should like to point out that there is an exact scale upon which they should base their drawings. There is now no modelling class in the school, whereas seven years ago eight or nine advanced students worked under the direction of a sculptor. The space allotted by the Institute for this department has been cut down, and the art school is being crushed out. Many private art classes are now held outside the Institution, and are well attended. It would be well if these could be in some way united to the art school, and in particular the good designing and embroidery school, which exists outside, might be brought in if suitable accommodation could be offered to it. At least four times the present accommodation of the art school should be provided, and another master should be appointed to organise and set certain additional departments in good working order. The present master has done excellently with the accommodation afforded him.

Aberdeen Gray's School of Art.

I visited the above school on February 10 and 11. I inspected the classes, and found the system admirably carried out, and the school well directed in all the departments. The activity and keen interest shown by the masters and students are very marked.

At this school in particular I made lengthy criticisms to each master regarding the work of his particular class. With regard to the higher branches of life and antique work, I would advise that to further develop these classes an extra master should be appointed.

The life classes should be held at least five days a week, two days being, in my opinion, quite an inadequate time to devote to what is the most important study of all.

The most advanced students should be encouraged to make life-size drawings and paintings of the figure, and I should like to point out that there is an exact scale upon which the student should base his drawings. In the still-life painting classes it would be advisable for the students to pay more attention to the backgrounds. The backgrounds should be studied as carefully as the objects themselves. This leads the student later to carefully study the background when he is painting a head or a figure. The ornamental modelling classes should, in my opinion, devote more time to designing and modelling from life and from natural objects rather than from so many classic ornaments and designs.

A large quantity of granite ornamental carving is done in Aberdeen for tomb-stones, &c. At present this work is mostly of a very stereotyped kind, and the school of art should make a distinct effort to influence the carver and induce him to make use of better classes of ornament and a more varied treatment. I should, therefore, suggest that a proficient architect might be appointed to deal specially with this matter.

The following suggestions made by Mr. Walton were also incorporated in each of the foregoing special reports communicated to the schools:—

With regard to colour, a student's palette should be limited to the absolutely necessary colours. A nude figure rarely has a yellow tint exceeding that of yellow ochre, a red exceeding that of light-red, or a blue exceeding that of

black mixed with white. There is, of course, no limit to the colours that may be in the background, and it is interesting at times to put a point of vivid colour in the background, and then that extra colour should be added to the palette; but as a general rule the above mentioned colours—yellow ochre, light red and black and white—are sufficient. Should these colours produce a black and inky effect in the student's work it is only evident that he has not dealt with his materials wisely, and until he understands the possibilities of these colours no others should be added to his palette. It is well known that many of Velasquez's greatest masterpieces were painted with a similarly limited palette.

I would also advise that the preparation of canvas should be understood by every student; it should be a part of his necessary training to learn to prepare his canvas. The canvas can be prepared in two or three ways; for the student a toned ground is preferable, and as a rule a warm grey is best. When a tempera priming is used, the study may be drawn in with charcoal, and then fixed with a fine spray of turpentine and a little oil or varnish. When an oil ground is used, before beginning to draw, the canvas should be washed with Fuller's earth and water, to remove all fatty matter from it, and when quite dry again the study commenced in charcoal. Should, however, the painting stand unfinished for any length of time, the surface should be washed again and again, until all grease is removed from it.

Students should make a careful study of pigments, and no fugitive or unreliable colour should be allowed. Many authorities have written on these subjects, and the best information should be put into the hands of the student by his master from the beginning. It is often said that it is not important for a student that he should use absolutely permanent colours, and also that cracking and discolouration do not matter in a student's work, but I know from experience that the student should be taught to practise extreme carefulness from the very beginning, otherwise he will be greatly handicapped in his future career. Nearly all the great masters were trained in youth to practise exceeding carefulness.

Mr. Walton expresses a high opinion of the plan adopted by the governors of the Glasgow School of Art, of procuring masters with the best foreign training to take charge of such important classes as painting and modelling from the life. He points out that training of the kind these masters have had has not been readily available in Britain in the past generation, and dwells upon the benefit to the schools from the stimulus of fresh ideas, and the opportunity of seeing other methods of working. He strongly recommends that the governors of the other schools should make themselves acquainted with the working of this plan in the Glasgow School of Art.

On the other hand, he is convinced that the term of office of such foreign masters in any one school should be limited say to a term of three years at most, though the same master might very well be employed for a certain period in each of several schools in Scotland consecutively.

HAND OR MACHINE-COLOURED MAPS.

AT the Glasgow Geological Society's meeting last week attention was called to one respect in which the very excellent work of the Geological Survey of Scotland is hampered by conservatism of method. In spite of the great recent progress in the economy and accuracy of colour printing, the maps of the Geological Survey of Scotland are still coloured by hand. The Ordnance authorities at Southampton have found that it is quite possible to print the English geological maps by machinery, so the method is practicable. Its adoption has enabled a great reduction to be made in the cost of the maps. The English quarto sheets are now being issued for 1s. 6d. each, while the slightly larger Scottish maps cost 6s. The hand-painted maps are not only dearer, but they are less satisfactory. The colours are often thick, and obscure the topographical details. The colours obtained by printing are brighter and more transparent. The machine-coloured maps, moreover, are more reliable, as the hand-painted maps are always open to the chance of some mistake by the colourist. The cheaper maps are also much more permanent. The hand-painted maps may be things of beauty when they leave the office of the Ordnance Survey, but they are not a joy for ever, for when hung upon a wall they rapidly fade even in our diluted sunshine, or if used in the field on a wet

day the colours run and the map is spoiled. It was pointed out in the discussion that the geological classes at the University use the 1s. 6d. English maps in preference to the 6s. Scottish ones, from the ease with which they can be read and the fact that they are not likely to be injured by a casual splash of water. The geological maps are not only of great value to the miner, farmer and all authorities on public health, but they should be of great educational value. Every school at which geography is taught should have a copy of the Geological Survey of its district. If the maps were issued at the same price as that of the English ones, they would no doubt be more largely used by teachers and by tourists. The question of expense is not a serious one. The maps are already often sold at a heavy loss, as it is impossible to get some of the maps hand-coloured at the price at which they are sold; and the cost of printing would be very small in comparison to the cost of the actual survey. The Geological Society, on the motion of Professor Gregory, moved an address to the Secretary of the Board of Education, urging the colour printing of at least the sheets of the Geological Survey maps of Scotland which deal with the mining areas and those of special geological interest.

RUSHTON CHURCH.

THE members of the North Staffordshire Field Club lately visited Rushton Church. The Rev. S. Thomas, the vicar, says the *Staffordshire Advertiser*, explained that in the churchyard were two stones which were said to be Druidical, the belief being that on that spot a Druidical temple once stood. There was also in the churchyard the stump of a cross, and it was supposed that St. Chad came to those parts, and, finding the people in the habit of gathering on that hill, planted a cross there and preached to them. In later times a church of wood was erected on the spot. It was only a nave originally, but was afterwards extended north and south. The present structure dated back to the thirteenth century, the date being fixed by the "dog-tooth" ornament carved in oak over the piers on the north side of the nave. When the British Archaeological Association visited the church some years ago, one section maintained that the ornaments were "dog teeth," whilst the other section held that they were *patera*. It the latter, the structure dated from the fourteenth century. The east end wall was supposed to be part of the original structure—this wall being of stone and the remainder of wood. The first alteration to the church was dated 1650, since when various small alterations had been made, until the present modern pews and parquetry were placed in the church in 1888. Mr. Thomas pointed out the quaint pews in the Swythamley chapel and the font of the pre-Reformation period. The latter, it was interesting to note, bore marks of knife or arrow sharpening. Mr. Scrivener said he did not agree that the ornament referred to was "dog-tooth" carving, and entirely concurred with the remarks made by Mr. C. Lynam in a paper read by him in 1882. This ornament was placed at intervals of 18 inches, and he had never seen or read of "dog-tooth" ornament placed at such intervals. He believed they were *patera*, and were the work of a later period than the thirteenth century. Mr. Scrivener then quoted as follows from Mr. Lynam's paper on the church:—"This church consists at the present time of a nave, chancel, north aisle, north chapel, south porch and western bell-cot with vestry. Like most of our parish churches, it is a building of varying dates, and it bears evidence in several ways of having its foundation at least in remote antiquity. It is to be observed in the first place that the original church comprised only a nave and chancel, and that these were constructed of timber, except the east wall of the chancel, which is now and, in my opinion, was originally of rubble stone. The south porch, which is also of timber, was attached to the original structure, and its ancient parts are probably coeval with the first building. . . . The nave consisted of three bays, and the chancel had two bays. On the north side the great posts which carried the roof still exist, and also the massive wall-plate which received the feet of the rafters. It is not so clear whether the north wall-plate of the chancel is original. The roof timbers have been very much altered and mutilated at different periods, but with slight exception the western truss of the nave roof (now partly hidden by the gallery front) is intact, and from it and the other remains the design of the original fabric may be distinctly discerned. On the sides were upright posts, from which sprung a huge arched beam; this supported a king-post with struts to principal

rafter and ridge-piece. The purlins and rafters are now hidden by a plaster ceiling, so that nothing can be said of them. The spaces between the side posts were filled in with boarding, in which were the windows lighting the interior. The western truss of the nave roof should be particularly noticed, as it is in every way of the finest design and workmanship. The treatment of the apex of the arched rib is most interesting. . . . In the chancel the lower portion of the arched ribs of roof is to be seen; the eastern one is moulded on its edges, and is probably part of the original church; the western one is of later date." As to the date of the structure, the writer said:—"In his 'History of Leek' Mr. John Sleigh quotes one of Mr. Norwood's conclusions respecting it, namely, that 'There is one ornament probably unique in England, namely, six dog teeth cut in oak over the piers on the north side of the nave.' The ornaments referred to are the carvings in the wall-plate at the east end of the north side of the nave, still visible. The dog-tooth ornament was not employed after the end of the thirteenth century, and regarding these carvings as examples of that ornament, as suggested by Mr. Norwood, we should learn from them that this church was erected before the year 1300. But before accepting this conclusion, we must be satisfied that 'dog tooth' is the right term for these carvings. Every student of Gothic architecture will agree with me that the ornament referred to cannot be called 'dog tooth.' Wherever these are employed the ornament is a continuous string of quatrefoiled leaves all placed close to one another. . . . Here at Rushton the ornaments are spaced with a considerable interval between them, and are, in fact, what are called 'pateras,' which occur constantly in fourteenth and fifteenth-century, as well as in earlier work. So that the conclusion of Mr. Norwood (based on the ornament being dog tooth) that this timber building is of the thirteenth-century date, cannot, I think, be accepted." Mr. Scrivener added that he quite agreed with Mr. Lynam, and he did not believe, though he should like to, that it was Early English work.

AN ANCIENT DURHAM CAMP.

A DISCOVERY of great interest to antiquaries, says a correspondent of the *Manchester Guardian*, has just been made on the estate of Lord Boyne, of Brancepeth Castle, by Mr. Edward Wooler, of Darlington. In the course of researches on behalf of Mr. Chalkley Gould, a well-known authority on ancient British earthworks, Mr. Wooler visited Middles Farm, about half-way between Brancepeth on the east and Low Taw on the west. A brief reference to a short piece of entrenchment in MacLaughlan's "Survey of the Roman Roads in Durham and Northumberland," and its situation between two branches of Stockley Beck, suggested the idea that probably this might be part of the boundary of an ancient camp, particularly as the streams converged at the eastern end and formed a V-shaped piece of land of considerable extent. As the result of frequent visits and careful investigation, Mr. Wooler has been enabled to define the outlines of the largest ancient British camp in the North of England after the huge entrenchments at Stanwick. The two branches of Stockley Beck unite near Oakenshaw Farm, at the eastern end of the earthworks, and both have very precipitous banks, which were evidently utilised as part of the outer defensive barrier of the camp. On the inner side of the streams, both north and south, there are strong entrenchments, of which the rampart is still in many places in exceedingly good preservation. Roughly, the shape of the enclosed camp is that of the sole of a boot, with the toe pointing to the east, and an idea of its size may be formed from the fact that the area is about 145 acres. The northern rampart is 1,654 yards long, that on the south 1,584 yards, the west (running from stream to stream) 493 yards, and the east—or toe of the boot—211 yards. The camp is slightly over 500 yards west of the old Roman road running between Binchester (Vinovium) and Lanchester (Longobardum?). In the places best preserved the ditch is still 6 feet deep and 3 feet wide, and the width at the top of the rampart is 11 feet. During the nearly nineteen centuries which have since elapsed, however, the natural erosion would be very great, especially as the camp stands about 700 feet above sea-level and the soil is very light and friable. It is evident, too, by reference to existing surveys 200 years old, that in the process of clearing adjacent land for cultivation a great quantity of rubbish and stones has been thrown into the old dyke.

Mr. Wooler concludes that this large, fortified camp was constructed at the time of the Roman invasion as a place of retreat for the Britons in the event of the huge entrenchments at Stanwick being found untenable. The distance between the two camps is about 16 miles, and from its size the newly discovered earthwork was evidently designed to accommodate not only a whole tribe, but also the herds and flocks which constituted their chief wealth. The defence of so great an extent of rampart—3,940 yards—would be so difficult that Mr. Wooler conjectures that the two streams were dammed towards the east so as to flood the adjacent low-lying ground (now very much of the nature of a morass), thus compelling any attack to be made on the comparatively easily defended west rampart. Just outside the north rampart was found a quantity of slag, which on analysis proved to be lead slag, and as there is neither trace nor record of any lead in the vicinity, the ore must have been brought from Weardale, a distance of about 10 miles.

Alteration of Essex Boundaries.

SIR,—Permit me to appeal to all who reverence the evidences of our country's story to oppose the Local Government Board's attempt to obtain Parliamentary sanction to a drastic alteration of county boundaries. Though the county of Essex is apparently to be the only sufferer on this occasion, the question is one which affects the whole country.

The petition presented to the Local Government Board by my Council explains the position, but in addition I would point out that the order will in this case alter bounds existing since pre-Roman days, and all for the sake of the Poor Law which may at no distant date be amended.

GEO. PATRICK, Hon. Secretary,
British Archæological Association.

Copy of Petition.

The President and Council of the British Archæological Association have heard with extreme regret of the proposal of the Local Government Board to remove ten parishes from Essex to Hertfordshire by altering the county boundary which has existed for a thousand years, thus destroying the landmarks of history. It is respectfully suggested that the requirements of the Poor Law administration can be met by financial arrangements between the two counties, and that in any case the ancient county name of Essex be retained. Should this transfer be accomplished a like rearrangement may follow all along the borderland of the county, and it appears to your petitioners that as a large part of England is subject to similar conditions, the matter should be dealt with as a whole rather than that one county should be selected for sacrifice.

Registered Plumbers.

SIR,—We beg to ask the favour of some notice of the endeavour which is being made by advertisement to reach the registered plumbers who have omitted to inform the Worshipful Company of Plumbers of their present address. In view of the decisions of the public health and water authorities and architects of the Kingdom as to the employment of registered plumbers in connection with sanitary work and water services, it is necessary that the rules and regulations relating to the production and renewal of certificates should be enforced with a view to the publication of revised local and general lists of registered plumbers. As the registration system is conducted by the Company in the public interest, the favour of your notice is solicited.—We are, sir, your obedient servants, HUNTER & HAYNES.

IMPORTANT NOTICE.

To all Registered Plumbers who have omitted to notify their present addresses.

In view of the various decisions of the public health and water authorities and architects of the Kingdom respecting the employment of registered plumbers upon sanitary work and water services, it has become necessary that the conditions endorsed upon the certificates of registration issued by the Worshipful Company of Plumbers should in all cases be strictly enforced and complied with. Accordingly an important notice has been posted to all registered plumbers whose addresses are known to the

company. Applications must be made forthwith to the company, or the secretary of the district council, for this notice, as non-compliance therewith on or before July 31 next will necessitate the cancellation of the certificate and the removal of the grantee's name from the register.

Dated May 29, 1905.

HUNTER & HAYNES,

Solicitors to the Worshipful Company of Plumbers.
9 New Square, Lincoln's Inn, London.

GENERAL.

Mr. Francis J. C. May, who recently resigned the post of Brighton borough surveyor, announces that he has entered into private practice in Brighton and London, and is prepared to act as consulting engineer, architect and surveyor.

The Total Amount subscribed up to date for the memorial to the late Mr. Brough, A.R.S.A., it is understood, exceeds 1,000*l*. The intention is to found a scholarship in painting and sculpture.

The Excavations on the site of the old Roman camp at Brough, near Hope, it is not expected will be resumed this summer by the Archæological Society, on account of their inability to obtain the necessary legal authority for entering on the ground.

The Dean of Canterbury on Ascension Day, the 1st inst., preached on behalf of the restoration of Bell Harry Tower. It was, he declared, the first monument that met the eyes of strangers who visited this land as they travelled to London, and the Dean of Westminster in permitting that appeal recognised that Canterbury had a special claim. One side of the tower had been restored, and was found to be even in worse case than was thought. To complete the work 10,000*l*. was needed, and they had only received 4,000*l*.

Mr. J. Somes Storey, the Derby county surveyor, has placed his resignation in the hands of the County Council. Mr. Storey has held the appointment since 1877.

The Buildings Sub-Committee of the Gosport education committee reported at their meeting last week that they had again considered the appointment of an architect for the new schools, and after the decision of the District Council on the matter they recommended that the surveyor (Mr. Frost) be instructed to prepare plans of the buildings for the approval of the committee, on the understanding that he would carry out the work without payment or honorarium.

Mr. E. Brown, who has been since 1900 on the engineering staff of Liverpool University, latterly as lecturer in applied mechanics, has been appointed assistant professor in civil engineering and applied mechanics in the McGill University at Montreal.

The Council of the Essex Field Club have forwarded a petition to the Local Government Board protesting against the order for removal of ten Essex parishes into Hertfordshire as being calculated to lead to the confusion of all historical and scientific records and bring about a disturbance of landmarks of extreme antiquity which is both needless and regrettable. The Council point out that, though the removal is said to be for administrative purposes only, the change of county name and consequent break in the continuity of history will inevitably follow, as has been the case with the three parishes taken from Essex in 1894. The Essex Archæological Society, which, as we have already announced, has also presented a petition on the subject, have been informed by the Local Government Board that "there is no question of dropping the old county name of Essex."

A Discussion will be opened on "Sanatoria for Consumption: Design and Location" at the Parkes Museum on the 16th inst., at 4.30 P.M., by Mr. Edwin T. Hall. Messrs. Percy Adams, Aldwinckle and Cutler will also speak. On Saturday there will be a visit to the Heatherside Sanatorium, Frimley, of which Mr. Hall is the architect.

Mr. A. E. Prescott, borough surveyor of Douglas, was on Monday appointed to a similar office in Eastbourne by a majority of the Town Council. The salary is 400*l*. rising to 600*l*. per annum. There were 163 candidates.

The Liverpool Cathedral Committee announce that all the windows in the lady chapel will be given by members of old Liverpool families. The foundations of the lady chapel and of one of the towers are now complete. Satisfactory progress has also been made with the foundations generally.

Mr. William James Taylor, architect and surveyor, of Bank Street, Sheffield, died last Saturday from blood-poisoning, which was the result of an accident sustained when inspecting some houses in course of erection.

Sawley Bridge, an old stone structure of six arches, which spans the Trent between Sawley and Castle Donington, has been condemned, as it has been found dangerous owing to the river undermining its foundations. A new bridge will be erected on its site at a cost of 23,000*l*.

Mr. W. Holman Hunt is to be among the recipients of the honorary degree of doctor of civil law from the University of Oxford, which will be conferred on June 28.

Mr. Sherard Cowper-Coles on June 28 will give an exhibition at Grosvenor Mansions, Victoria Street, of his new method for blending and inlaying metals. A variety of colours and new effects can be obtained, as one or more metals can be inlaid and blended in a similar manner to enamels, but at a much lower temperature.

Mr. Horace Allen, C.E., has opened an office at 17 Cheap-side, where he can be consulted on subjects relating to gas engineering.

The National Academy of Design and Columbia University School of Architecture are to unite to form an institution under the joint control of the University and the Academy. According to the agreement 500,000 dols. is to be raised by the Academy for the erection of a new building, for which the University is to provide a site upon its campus, probably at 116th Street and Broadway.

Mr. R. M. Lucas, architect, Southampton, has proposed to deposit 100*l*., to be paid over to the South Hants Hospital or the cricket club if he fails to produce testimony from six architects and six builders in direct contradiction of the statement of a member of the South Stoneham Rural District Council, that Mr. Lucas's plans for a cottage did not show the floor as a solid one, and for which the surveyor demanded ventilation.

A Meeting of Florentine artists and professors was recently held under the auspices of Signor Pellerano. They have appointed a committee to arrange for the founding of a gallery of modern Tuscan art in Florence similar to those in Venice, Milan and Turin. The hope is entertained that the new gallery may be opened next year.

The Carnegie Dunfermline Trust state in their monthly report that, with the sanction of Mr. Oldrieve, H.M. Board of Works' architect for Scotland, certain repairs were being made at the Palace ruins. The drainage system is being altered so as to remove from the front Palace wall a number of unsightly conductors. The King's kitchen and the crypt underneath it are at the same time being refloored with cement in order the better to preserve the property.

Mr. C. F. A. Spratt, architect, has redrawn and published Mr. H. E. Malden's map of Surrey in 1086. The scale is half an inch to a mile.

A New Building is to be erected at the corner of Belvedere Grove and Courthope Road, Wimbledon Hill, to be called Clifford House, and will consist of high-class residential flats. The elevations will be in unison with the surrounding properties, which are of superior character. Messrs. R. Ward & Son, Battersea, are the contractors. Messrs. Palgrave & Co. are the architects.

The Exhibition of works in wood and wood-carving at Carpenters' Hall will be open for inspection after next week. The conversation will be held at 3 P.M. on Monday, 19th inst., when the prizes will be presented to the successful exhibitors and the exhibition declared open by Lord Avebury, F.R.S., D.C.L.

Lord Rayleigh is to receive the Albert Medal of the Society of Arts in recognition of the influence which his researches, directed to the increase of scientific knowledge, have had upon industrial progress, by facilitating, amongst other scientific applications, the provision of accurate electrical standards, the production of improved lenses, and the development of apparatus for sound signalling at sea.

The Secretary to the British school at Athens has placed in the hands of the Vice-Chancellor of Cambridge University the nomination to a studentship of the school. The studentship is of the value of 50*l*., conditional on the student's residing three months, and would be raised to 100*l*. if the student completed six months' residence. Students of Girton and Newnham are eligible. The Vice-Chancellor invites candidates to send their names to him on or before June 17, together with such evidence of their qualifications as they may desire to submit.

The Architect.

THE WEEK.

A GRACIOUS act has been done by HIS MAJESTY in purchasing the bank of the river Liffey outside Dublin for a length of nearly one and a half miles, the area being about 200 acres. Everyone who has visited the Phoenix Park in Dublin knows that the ground slopes steeply to the river on one side. The view is picturesque, and has been often selected by Irish landscapists for paintings. On one spot the University have put up a boat club-house, and here and there villas are erected. The people of Dublin are beginning to realise the value of the districts which environ the city, and there were apprehensions that the banks of the Liffey might be utilised for buildings which would not prove an additional attraction. In order to preserve the amenity of the landscape, the Commissioners of Woods and Forests have purchased the land for about 10,000*l.*, and it will be the fee simple estate of the KING, his heirs and successors. The boon will become more valuable if the public are not shut off from the river, as is the case at present.

It might be supposed that the exaggerations of sculptors in treating unpleasant subjects were generally known by this time. From many works which are produced in our time the old Greeks, if they could revisit the earth, would turn away their eyes. But as there is no accounting for tastes, it may happen that a work which is admired by cultured citizens in one city will be reprobated elsewhere by men and women who are no less capable of judging. A curious instance which exemplifies the connection between geography and criticism has occurred in Liège. M. LAMBEAUX, a Belgian sculptor, produced a very difficult marble group which he called *Le Faun Mordu*, representing a woman or fauness biting the ear of a satyr. The work was of extreme difficulty, but, if not beautiful, it displays great power. It was exhibited in Brussels, Düsseldorf, Paris and St. Louis, and as a remarkable group the sculptor was invited to display it in the gardens of the International Exhibition at Liège. The jury expressed satisfaction on its arrival, and it was duly placed in a prominent position. But a couple of days afterwards it was stated in one of the local papers that the work was to be removed. On M. LAMBEAUX remonstrating the secretary announced that he had received orders to that effect. Afterwards it was stated that the committee were given the choice to expel M. LAMBEAUX's group or to be deprived of the reliquary of St. Lambert, which for four centuries has been considered the principal treasure of Liège. The authorities of the exhibition, as men of business, prefer the relic, and the group had to find some other refuge. We suppose the dispute is not entirely concerning the demerits of M. LAMBEAUX's work. Liège for centuries was ruled by prince-bishops, and probably the sculptor's group was employed to test the strength of ecclesiasticism at the present time.

THERE WAS a time in this country when it was believed that inventors could be assisted through the agency of societies. When it is remembered that patents were necessary, and that an inventor claimed an exclusive right in his production, it would be self-sacrificing on his part to run the danger of acquainting people having a little knowledge about the peculiarities of his improvement. In our time it is not necessary for anybody who has an invention that is likely to be successful to go a-begging for aid. The change that has taken place in the position of inventors has been exemplified by a lawsuit which is now before the Scottish Courts. It appears that in 1819 a Mr. KEITH

left 1,000*l.* for the prosecution of science. Of that sum 400*l.* was offered to the Society for Promoting the Useful Arts in Scotland, which is now known as the Royal Scottish Society of Arts. The money was accepted on the condition that the principal was to be invested and the interest applied "in sums of money or medals in rewarding inventions, improvements, or discoveries in the useful arts, which shall be primarily submitted to the Society." Fancy expending about 12*l.* a year in the hope of fostering invention to an unlimited extent in Scotland. It is needless to say inventors were not to be captivated, and the 400*l.* has been lying unused in the sense that was intended, but it has fructified until it has become 2,257*l.* 16*s.* 8*d.* But even the interest on that sum appears to be scorned by inventors in general. The Society now ask the authority of the Court to expend the income in the payment of the expenses of or connected with lectures on the useful arts or scientific subjects, or in making money grants in aid of experiments and of work of research in or connected with the useful arts in Scotland.

It is intended to erect a technical school in Dublin, but the difficulty seems to be the selection of a site. A great many people in the city would gladly dispose of their property, and about forty sites were offered to the technical education committee. Two or three years have been occupied in endeavouring to select one. The number was reduced to six, and finally to three. The report relating to the latter will suggest the value of property at the present time in Dublin. Site on Cavendish Row, area 31,000 square feet, subject to 192*l.* rent, rateable valuation 346*l.* 10*s.*, price 13,200*l.*; site on St. Mary's Place and Upper Dorset Street, area 48,000 square feet, subject to 65*l.* rent, rateable valuation 395*l.*, price 12,300*l.*; Bolton Street, area 31,400 square feet, subject to a rent of 90*l.*, rateable valuation 146*l.*, price 7,570*l.* The three sites are in the northern part of the city. It might be supposed that the students who were desired would be also found in the south. The amount demanded in all cases seems to be unreasonably high. The committee believe they will be able to obtain the property for a lower price, and their report was adopted by the small majority of one.

It would be remarkable if the United States anticipated Great Britain in the establishment of a Ministry of Fine Arts. As far back as the days of Sir ROBERT PEEL it was supposed to be a necessity, and he was considered to be especially qualified to become its representative. We seem to be as far as ever from having a Minister of Fine Arts. A resolution of the Society of Beaux-Arts Architects, which was lately adopted, suggests that few obstacles to the addition of such a Minister to the Government of the United States now exist. Having expressed gratification at Mr. JAMES STILLMAN's gift of 100,000 dols. to the French Ecole des Beaux-Arts, the members of the Society adopted the following resolutions:—"Whereas, history teaches that the most enduring records of the greatness of a nation are its monuments of art, and that the cultivation and development of the fine arts are of paramount importance to the progress of a people; and whereas, to successfully foster and develop the artistic tendencies of a community these tendencies must be unified and nationalised; be it therefore resolved that it is the opinion of the Society of Beaux-Arts Architects that the time has come when it is eminently fitting and the bounden duty of the Government of the United States to officially recognise these facts and to undertake, by the establishment of a department of the Government, the direction of this fundamental part in the evolution of its people." There are so many candidates for office in America, we suppose there would be no objection to have a Minister for each of the fine arts.

WORKMEN'S COMPENSATION.

THE departmental committee appointed in 1903 to inquire into the law relating to compensation for injuries to English workmen sent out circulars asking for suggestions for the amendment of the Acts of 1897 and 1900. In the course of the reply from the Yorkshire Federation of Building Trades Employers it was stated:—"With regard to the pecuniary burdens, the experience of the trades falling within the scope of this Federation is that for the considerations aforesaid the pecuniary burdens imposed by the Act are becoming a most serious question, particularly in the building trade. The claims are numerous, practically unrestricted, and cause a continual advance in indemnity premiums. My Council would suggest the insertion of a clause making it compulsory upon architects when framing bills of quantities to provide that the insurance or indemnity premiums should fall upon and be paid by the building owner." The words indicate the view taken by many builders. They adopt all the precautions which experience has dictated for preventing accidents to their workmen. If injuries happen to the men they are looked on as any other contingencies, such as defects in foundations, and the expense should, therefore, fall upon the building owner. The proposal would be no more than an official acceptance of calculations which are now inevitable with all contracts. Many things arise which increase the cost of works, and a builder exercises his foresight in allowing for them.

The reply of the Federation, however, shows that the Workmen's Compensation Act is usually considered in its financial relations alone. There can be no doubt that the Act was originally an imitation of the law promulgated in Germany in 1884, by which security for the relief of persons injured in their occupations was provided by means of a system of compulsory insurance. In England there were already remedies open to workmen at Common Law, but they were difficult to enforce and an action was expensive. One intention of the German law-makers was the prevention of accidents. It has been so successful that a marked diminution of the percentage of fatal cases and of cases of total permanent disability has been demonstrated by statistics. In England there is no evidence of a similar result. There may have been improvements in various trades by which risks of injury are diminished. But the departmental committee who investigated the subject declared themselves "unable to come to the conclusion that the operation of the Compensation Act of 1897 has had any marked or ascertainable effect one way or the other upon the safety of workmen."

With some employers it is possible that as they have insured against accidents they grow indifferent. Evidence to that effect has been given from time to time. The representative of a union of builders' labourers informed the committee that the generality of the practice of insurance by shifting the responsibility makes employers more careless. But we think it can be asserted with no less truth that the expectation of receiving compensation makes building workmen still more careless. An accident brings loss to a builder in other ways besides paying compensation, for it disturbs the organisation which is necessary on works. As the other men on the job become demoralised, the quantity of work they perform is diminished. It is therefore a necessity with a builder to make arrangements which will insure safety, but as a foreman cannot be in several places at once it is not difficult for an accident to arise when his observation is directed elsewhere. In fact, superintendence has by reason of the Act assumed a new character, for it has to be directed towards the preservation of workmen from the consequences of their own carelessness rather than towards the carrying out of the contract with efficiency and economy. A foreman has now a divided duty before him, for he has to look after men with as much assiduity as if they were not possessed of ordinary sense. As men who are

approaching their second childhood are imagined to require more surveillance to keep them from danger, they in consequence find it more difficult to obtain employment. Men who have been slightly maimed will not be again insured against accidents by some companies. All the sorrows of both classes are attributed to the evil effects of the Compensation Act.

It is now more difficult to amend the Act than it was to prepare it originally. Such a multiplicity of interests have grown up in connection with the clauses, it is almost impossible to deal boldly with arrangements through which so many people besides employers and workmen are connected. For instance, the British Medical Association recently sent a petition to the Home Secretary in which they objected that the 300 medical practitioners appointed as referees under the Act were not always called in by county court judges, and they were being superseded by the medical officers of the insurance companies. The cost of litigation in many cases exceeds the amount of compensation, and all who take part in such suits are opposed to changes which would make litigation less expensive. It must therefore be concluded that an amended Workmen's Compensation Bill will bear the character of a compromise.

We see this in the Bill which has just gone through the House of Lords, but has yet to bear the scrutiny of the House of Commons. In the first section there is reference to personal injury by accident arising out of and in the course of the employment caused to a workman, for which the employer is liable to pay compensation. Objection has been repeatedly made to the word "accident," and at first sight it may appear to be unnecessary. And these occurrences, it has been pointed out, can hardly be said to be accidental like the fall of a ladder or the collapse of a plank. Again "arising out of" does not give emphasis to "in the course of" employment. The Lords have, however, retained both expressions. The long sub-section (b) of Section 1 has been deleted, and sub-section (c) remains. Sub-section 3 also remains; sub-section 4, which relates to seeking damages under other Acts, has been amended. Section 3, which treats of contracting out, is preserved.

Section 4 was and continues to be one of the most important, for it relates to sub-contracting. "Undertaker" is now made equivalent to "principal," and sub-contractor becomes contractor. The principal, it is said, shall be liable to pay to any workman employed by the contractor in the execution of the work any compensation "which he would have been liable to pay if the workman had been immediately employed by him; and where proceedings are taken against the principal, then in the application of this Act references to the principal shall be substituted for references to the employer, except in the provisions relating to the amount of compensation." The principal is to be indemnified by the immediate employer of the workman, and the workman is not to be prevented from recovering compensation from the contractor instead of the principal if the former can be considered as the undertaker. It was stated that the Act did not apply to work which was ancillary or incidental to the trade or business. It is now added, "nor shall it apply in any case where the accident occurred elsewhere than on or in or about the premises, work or building in respect of which the principal is the undertaker within the meaning of this Act." The addition is of great importance to builders or principals. It could not be interpreted, we suppose, that an accident which arose in a factory for making girders, columns or roofs would make the principal liable, and he would also be exempted if accidents occurred in quarries which were not his own. Section 5 remains as before.

Section 6 relates to the recovery of damages from a stranger. The workman may take proceedings to recover damages against that person, but he cannot recover damages as well as compensation. If he obtains compensation the person who paid it shall be

entitled to be indemnified by the stranger. The clause used to have little practical application, but, as compensation to sailors is now admitted to some extent, it can apply to the owner of a ship. Clause 7 has given rise to much litigation, for it determined the extent to which the Act could be applied. It related to a railway, factory, mine, quarry or engineering work, or any building exceeding 30 feet in height which was being constructed or repaired by means of scaffolding. It is now altered as follows :—

This Act shall apply only to :—(a) Employment by the undertakers (i.) on or in or about a railway, tramway, factory, workshop, laundry, dock, wharf, quay, warehouse, mine, quarry, engineering work, or smithy; or on or in or about a building which is being constructed, altered, repaired, decorated or demolished; or (ii.) about the business carried on by the undertakers at any such premises, work or building as aforesaid, but away therefrom, if it is proved that the absence of the workman from such premises, work or building was due to the nature of his employment at the time of the accident.

It will be observed that there are several additions, and a 30 feet standard for building is set aside; nor is there anything about scaffolding or machinery. Apparently there will be no longer a necessity to have any new definition of a building, or to describe what kind of mechanical power is employed for constructing, repairing or demolishing it. As it is, the definition has been extended so as to comprise "the site of an intended building, and the construction of a building includes the work of preparing for and laying the foundation of an intended building." Factory has the same meaning as in the Factory and Workshop Act of 1901. Workshop means other than a domestic workshop; and warehouse, about which there have been disputes, is henceforth to apply to "any premises used solely or mainly for the storage of goods in connection with or ancillary to a retail business, whether included in the building in which the retail business is carried on or not."

We need not enter into any consideration about claims; that is an affair for lawyers rather than for contractors. But the subject of dependents among whom compensation is divided has become less vague, for it refers to "such of the following members of the workman's family as were wholly or in part dependent upon the earnings of the workman at the time of his death, and as are residing in the British Islands; that is to say, wife or husband, father, mother, grandfather, grandmother, step-father, step-mother, son, daughter, grandson, granddaughter, step-son, step-daughter, brother, sister, half-brother, half-sister." It is proposed that the Act shall come into operation on January 1, 1906, but, except in certain cases, only where the accident happened on or after that date. The Bill has, however, to be subjected to examination in the House of Commons and by men who possess experience of the working of the former Acts, and are, therefore, competent to apply different tests to those adopted by their Lordships. There are many people who would prefer that the existing Acts were repealed and an entirely new Act substituted. That was the opinion of Judge GYE, who, among others, recommended "that the whole law of compensation for injuries should be codified, and, if possible, should be re-enacted in its entirety in a single new Act of Parliament, dealing with the whole subject in distinct parts and under separate headings." We suppose it was considered more prudent to endeavour to patch up the existing Acts. Builders have good reason to complain of the expansion which has been given to those parts which relate to them. The Act was originally intended to meet exceptional trades which were dangerous and hazardous, and especially when men came in contact with machinery. Hence it was that high buildings were contemplated, and accidents were supposed to commence at a height of 30 feet above the ground. But unless there is an

alteration in the House of Commons a building may mean the site only, and the liability of the contractor commences as soon as a sod is raised or a post driven into the ground. That is not in keeping with the original Act.

MECHANICAL AIDS TO EXCAVATION.*

WHEN constructing the canals and railways of Great Britain the system employed in the earthworks could not have varied much from that which was used for the great undertakings of Eastern and Egyptian monarchs. Cuttings and embankments were made by the muscular power of men aided by shovels and picks. In many instances horse-power was not utilised for hauling the trucks containing the material until they had been pushed a long distance by men's arms. After a time the contractor's engine was introduced in the form of a locomotive that was not disarranged by jolting on an imperfect resemblance of a permanent way. A modern contractor, and especially one who hailed from America, if he were able to see in vision English railway work at an early period, could not help being amused at so primitive a system, and yet immense cuttings and embankments were formed and the work has needed few reparations.

The illustrations which appear in American periodicals and books on engineering are enough to suggest that the procedure has been entirely reversed, and that in such works as railways little is left for human arms. There are men introduced who seem to be engaged in cutting or banking, but one of the old English navvies would consider their efforts as little more than playing with clay or gravel.

In Mr. ZIMMER's book what is usually described as engineering construction does not form the only subject. He treats of machinery which is employed for lifting and moving other materials such as coal, grain, timber and much else which is necessary in business. Elevators, worm conveyers, cable conveyers, band conveyers, chain and rope haulage, skips and grabs, trucks, &c., are all described and clearly illustrated. Architects may have to erect warehouses or other buildings in which such machinery will be installed, and in the pages they can realise what is required in order to secure efficient working of the different appliances. For instance, in the Liverpool warehouses, where grain is received, it was found that to convey grain horizontally it had to travel over 7,000 feet, and as the most efficient means continuous bands were used. Hydraulic cranes are employed for discharging vessels, and they are fixed in towers constructed in the warehouses. The foreign granaries differ in some respects from those in England. One interesting example of an arrangement for moving is the Bolinder timber conveyer which is in use at the Millwall Docks, and which can be arranged on a curved as well as a straight line. One of them will deliver about 200 standards of 5 inch \times 7 inch battens in ten hours. A later arrangement consists of an endless chain made up of a series of rollers, and the capacity is 160 standards in ten hours. An enormous amount of labour must be saved by the structure.

Although the inventions in their perfected form are a product of our times and owe their existence to the necessity of executing work at a cheap rate, yet antiquity can show at least a recognition of the principle. ZIMMER refers to one of the carvings discovered at Nineveh by LAYARD, in which a warrior is represented

* *The Mechanical Handling of Material.* Being a Treatise on the Handling of Material such as Coal, Ore, Timber, &c., by Automatic or Semi-Automatic Machinery. By George Frederick Zimmer, A.M.Inst.C.E., with 550 Illustrations. (London: Crosby Lockwood & Son.)

Earth and Rock Excavation. A Practical Treatise. By Charles Prelini, C.E., with Tables and many Diagrams and Engravings. (New York: D. Van Nostrand Co. London: Crosby Lockwood & Son.)

cutting a rope to which a bucket was attached, and it was used to draw water from a well outside the besieged castle. The rope ran through a pulley-block. In the Leyden Museum is a sheave and pulley-block which was used in remote days in Egypt. Mr. ZIMMER also reproduces an old print in which we see a ropeway employed in the city of Dantzic as far back as 1644. He tells us:—

This ropeway connected the city ramparts with a hill outside the town known as the Bischoffsberg. A single rope was passed over pulleys suspended on high posts, two of which were embedded in the city moat. The rope carried a number of rather diminutive buckets, which were filled with earth on the hill and were discharged at a certain point on the ramparts. Probably, the earth was used for strengthening the fortifications. The empty buckets were returned to the starting-point on the same rope, which ran back on another line of posts. This was simply an endless rope running between two not very distant points.

The modern ropeway may be said to date from the adoption of wire ropes and cables. It is a remarkable fact that although, as already stated, wire ropes were known to the Romans eighteen centuries ago, they were not pressed into the service of modern engineering till the nineteenth century was well advanced. The practical use of twisted wire rope seems of no earlier date than the thirties; though wire ropes were reported to have been used in England as early as 1832, the pioneer in this field is believed to have been a German engineer, Professor Albert, of Claushal, who introduced these wire cables into his native land in 1834. The first English patent for ropeways was taken out on July 20, 1868, by Charles Hodgson, on whose invention most of the modern ropeways are more or less founded.

A ropeway was lately employed for the construction of the new Beachy Head lighthouse. The work-yard had to be at the top of a cliff 400 feet above the sea, and the site of the lighthouse was 600 feet from the base of the cliff. Both men and materials were carried in trucks, and no accident appears to have occurred. In India the system has been largely used for conveying timber from forests, and ropes have been also used in Tasmania, New Zealand and in places where ordinary means of traffic would be too costly. No less interesting are the appliances for lifting heavy weights, such as barges, by which they can be loaded or unloaded at a cheap rate and with expedition. Messrs. AVERY'S weighing machines may also be considered as lifters. The automatic grain scale is equal to a load of 12,000 lbs. Their automatic weigh-bridge can take loads of 20 tons. There is much else in Mr. ZIMMER'S book which will be found interesting. It represents one important branch of engineering, in which statics and dynamics are combined. All the machines have to be constructed on principles which to some extent correspond with those required in bridges and other structures, and the foundations must be calculated with as much care as if they were required for large buildings. The practical illustrations reveal the details of construction, and as mechanical handling of material is daily increasing in favour the utility of Mr. ZIMMER'S work can hardly be over-estimated.

In Mr. PRELINI'S "Earth and Rock Excavation" the machinery which American ingenuity has devised to supplant manual labour in one important class of work is more particularly described. As a rule the labourers engaged in American excavations are foreigners, and they only hold their positions until some new invention supplants them. We are told that "On one section of the New York subway a contractor with great political influence employed a lawyer so as to have him at hand in any accident; that he could gather evidence in order to demonstrate to the friendly judges that the accident was caused exclusively by the victim, and the contractor is only too generous when he refuses to sue him for damages." Mr. PRELINI says that conduct is abominable; but it reveals the spirit with which capital deals with labour of an inferior kind. The better class labourers obtain employment in connection with the

machines to which they might be assumed as inimical, and although they are paid less than mechanics, there is a slight improvement in their condition. As a rule all excavators are regarded as alike, and they are simply looked on as living machines.

The channelling machine which the Americans favour cuts vertical slots or channels in rocks, and the amount of work performed varies according to the hardness of the rock. On the Chicago Canal the quantity ranged from 50 square feet in moist material to 500 square feet in hard rock. On that great work it was calculated that the cost was 3 cents per cubic yard of material excavated. Drills are becoming familiar in this country; the price of one class has been increased owing to the difficulty of finding diamonds, but a substitute has been obtained, it is said, by using steel teeth. On English railways powder alone was used for blasting, but now there are a variety of compounds of the nitro-glycerine class which are more effective. Mr. PRELINI says that "nearly all the explosives with fancy names which are placed on the market are simply false dynamites." He advises engineers and contractors to avoid the purchase of any explosive of which the ingredients are concealed. In America anyone can manufacture explosives after obtaining permission from the State, and there are no special laws for their transportation. The arrangements adopted when explosives are employed in American towns are thus described:—

In conducting blasting operations in city streets or in thickly settled districts it is the usual practice to cover the holes with a protecting mattress before firing them. Such mattresses are usually made of logs about 1 foot in diameter, loosely chained together into a mattress-like bunch. In New York city each mattress usually consists of ten logs, and enough mattresses are used to cover the full area of the blasting cone. Over these logs is placed a heavy netting made of $1\frac{1}{4}$ to $1\frac{1}{2}$ inch manila rope, or else a sheet of tin, usually a section of discarded tin roofing. Logs and rope nets are preferable to logs and tin sheets. The logs should be loosely tied together so that they give an elastic mattress to absorb the force of the explosion; if fastened rigidly together they will break and splinter. The operation of these mattresses is as follows:—They rise into the air from the force of the blast, but confine the flying stones underneath and immediately drop back to near their original position because of their great weight.

For excavation there are numerous appliances. A plough, differing in shape from that used in agriculture, is one. Then there are "graders" of various kinds, and some in which a locomotive and grader are combined in order to dispense with horses. The ladder and buckets or continuous digging machine is believed to have been first utilised in the Suez Canal. There is also an up-digging machine, an excavating machine and various others. Ordinary manual labour is displaced by the steam shovel, of which there are many types. One bucket employed on the Panama Canal has a capacity of $1\frac{1}{4}$ cubic yards, and its average output is 500 cubic yards a day. There are different sorts of buckets which open to deliver material and close to form receptacles for additional stuff. In America there is a greater variety of carts conveying materials than with us. In one the bottom can be opened, allowing the material to fall out without stopping the horses, so that not an instant of time is lost. In some parts of the country a "stone boat" is used for heavy materials. It is without wheels and is drawn like a sledge. But as it stands within a few inches of the ground there is no trouble in loading with rocks or other material. For vertical hoisting the Americans have a variety of derricks and locomotive trains. They have also aerial transporters of many types.

The author, in conclusion, describes some modern canals and works in which the machinery he explains was employed. One of them is the Panama Canal. He is a champion of M. DE LESSEPS, whose idea was to construct an open sea-level canal in which vessels could

pass from ocean to ocean without stoppage. After expending a good deal of money to carry out a different policy, the original idea is likely to be realised. Digging and drilling machines, cranes, locomotives, cars and dredgers have been utilised. But in spite of all those auxiliaries, the men engaged were unable to withstand the climate and the results of the excavations, which brought to the surface dangers which had been imprisoned within the earth. Mr. PRELINI says:—

In the excavation of the Panama Canal at times were employed 13,000 men, of which 12,000 were workmen, and 1,000 between foremen, superintendents, engineers, &c. As a rule, when an excavation is effected in any locality, bacteria spread in the air in such quantities as to affect the health not only of the labourers, but also that of the inhabitants living close by. For this reason are found symptoms of malaria near every excavation of some importance, and even in localities never affected before. But to excavate such an enormous amount of earth as was then required for the construction of the Panama Canal, and in a tropical region where many other diseases are encountered, was a hard proposition. The death rate among the men employed in this work was something awful, being $7\frac{1}{2}$ per cent. among the workmen and 6.4 per cent. among the employers. These numbers would have certainly been doubled if it were not for the strict sanitary measures adopted by the company in order to safeguard the health of its men, and for the enormous expenses it underwent to provide for the comfort of the men, greatly improving the sanitary conditions of the locality. European workmen could not stand the climate and were decimated; the only ones who could resist it in those regions came from Jamaica, but they were very slow in their work.

Mr. PRELINI's book describes the latest ways of excavation and embankment, especially in undertakings on a grand scale. There is no doubt that much work continues to be done in this country in a primitive manner. There is room for the new book, and it is to be hoped it will have the effect of promoting economy by suggesting a better system. At the present time railway companies are blamed because of their excessive charges, which are supposed to aid foreigners in their competition with English producers. But when it is remembered how costly was the making of every railway and the large sums which had to be given to obtain an Act, the prices charged are not out of keeping with the preliminary expenses. Economy of construction must affect the prices to be paid for the conveyance of goods.

REGULATIONS FOR COMPETITIONS.

THE following regulations were approved by the Royal Institute of British Architects at the meeting on the 5th inst. :—

If the promoters of an intended competition desire members of the Royal Institute of British Architects to take part therein, the conditions should be based on the following suggestions :—

1. The promoters of an intended competition should, as their first step, appoint one or more professional assessors, architects of established reputation, whose appointment should be published in the original advertisements and instructions. The selection of the assessor should be made with the greatest possible care, as the successful result of the competition will depend very largely upon his experience and ability. The President of the Royal Institute of British Architects is always prepared to act as honorary adviser to promoters in their appointment of assessors. All the designs sent in should be submitted to the assessors.

2. The duty of assessors should be, after conference with the promoters :—(a) To draw up the particulars, conditions and suggestions in accordance with instructions to competitors, such documents to be so drawn up as to form an agreement between the promoters and the competitors, and also to advise the promoters upon the question of cost and the amount and apportionment of the premium or premiums. (b) To determine whether the designs conform to the instructions, and to exclude any which do not. (c) To advise the promoters on the relative merits of the designs admitted to the competition, and to make a selection in accordance with the instructions.

Note.—It is essential in drawing up the instructions to state definitely which of the conditions must be strictly adhered to, and those which are merely optional or of a suggestive character.

3. No promoter of a competition, and no assessor engaged upon it, nor any employé of either, should compete or act as architect for the proposed work.

4. The number, scale and method of finishing of the required drawings should be distinctly set forth, and they should not be more in number or to a larger scale than necessary to clearly explain the design, and such drawings should be uniform in size, number, mode of colouring and mounting. If the assessor advises that perspective drawings are advisable, it should be so stated.

5. Competitions should be conducted in one of the following ways :—(a) By advertisement, inviting architects willing to compete for the intended work to send in designs. The promoters, with the advice of the assessor or assessors, should make their selection from such designs. The author of the design awarded the first place should be employed to carry out the work. (b) By advertisement, inviting architects willing to compete for the intended work to send in their names by a given day, with such other information as the candidate may think likely to advance his claim to be admitted to the competition. From these names the promoters, with the advice of the assessor or assessors, should select a limited number to compete, and each competitor thus selected should receive a specified sum for the preparation of his design. The author of the design awarded the first place should be employed to carry out the work. (c) By personal invitation to a limited number of selected architects to join in a competition for the intended work. Each competitor should receive a specified sum for the preparation of his design. The author of the design awarded the first place should be employed to carry out the work.

6. No design should bear any motto, device or distinguishing mark; but all designs should be numbered by the promoters in order of receipt. Any attempt to influence the decision of the promoters or of the assessor or assessors should disqualify a competitor.

7. The author of the design placed first by the assessor or assessors should be employed to carry out the work, and he should be paid in accordance with the schedule of charges sanctioned and published by the Royal Institute. If no instructions are given to him to proceed within twelve months from the date of selection, or if the proposed works are abandoned by the promoters, then the selected architect should receive payment for his services in connection with the preparation of the competition drawings of a sum equal to $1\frac{1}{4}$ per cent. on the amount of the estimated expenditure.

8. In every case the amount of premium or remuneration for the competitive designs should be fixed under the advice of the assessor or assessors.

9. Where a deposit is required for supplying the instructions, it should be returned on the receipt of a bona-fide design; or if the applicant declines to compete and returns the said instructions within a month after the receipt of replies to competitor's questions. The deposit required should not exceed the sum of one guinea.

10. Each design should be accompanied by a declaration, signed by the competitor, stating that the design is his own personal work, and that the drawings have been prepared under his own supervision.

11. A design should be excluded from a competition—(a) if sent in after the period named (accidents in transit excepted); (b) if it does not substantially give the accommodation asked for; (c) if it exceeds the limits of site as shown on the plan issued by the promoters, the figured dimensions on which should be adhered to; (d) if the assessor or assessors should determine that its probable cost will exceed by 10 per cent. the outlay stated in the instructions, or the estimate of the competitor should no outlay be stated. If the assessor or assessors be of opinion that the outlay stated in the instructions is inadequate, he or they shall not be bound in the selection of a design by the amount named in such instructions, but the question of cost shall nevertheless be a material element in the consideration of the award; (e) if any of the other instructions are violated.

12. It is desirable that all designs and reports submitted in a competition, except any excluded under Clause 11, should, with the consent of their authors, be publicly exhibited after the award has been made, which award should be published at the time of the exhibition. At the close of the exhibition all the designs, with the exception of

the one placed first, should be returned, carriage paid, to their authors.

13. It is essential to the success of any competition that the promoters should agree in their instructions that the award of the assessor should be adhered to unless there is some valid objection to the employment of the author of the design placed first, as to which the assessor should be satisfied.

14. In the case of works of considerable magnitude it is desirable that three assessors should be appointed. As stated above, the President of the Institute is always ready to advise on this or other points.

NORFOLK AND NORWICH ARCHÆOLOGICAL SOCIETY.

THE annual meeting of the Norfolk and Norwich Archæological Society has been held at the Guildhall, Norwich. The President (General W. E. G. L. Bulwer, C.B.) occupied the chair.

The Hon. Secretary, says the *Norwich Mercury*, read the annual report, which contained a record of the meetings and excursions organised by the Society during the past year. Reference was also made to the 500th anniversary of the incorporation of Norwich. Death had removed during the past twelve months the Rev. E. H. Nelson, Mr. W. Carr, Mr. Archibald Day, the Earl of Chichester, the Rev. H. Dunster, the Rev. Frederick Davies and Mr. Samuel Nightingale.

The Treasurer's report showed that the year 1904 started financially with a balance at the bank of 353*l.* 16*s.* 1*d.*, and concluded with a balance of 378*l.* 0*s.* 2*d.*

Sir Peter Eade proposed the re-election of General Bulwer as president, and said they all knew how admirably he had fulfilled the position in the past and what a great service he had rendered to the Society, and the motion was carried unanimously.

Mr. Bolingbroke read a letter from Mr. Walter Rye in which he expressed the desire to resign his position on the committee and the sub-publication committee.

The President read a letter from the Rev. Dr. Jessopp, in which he said:—"The Society is so deeply indebted to Mr. Rye for his invaluable services in the cause of Norfolk archæology that it seems to me it would be little less than a crying scandal if he were allowed to resign his position amongst us, even though such resignation were accepted with a unanimous testimonial of our regret, and with the fullest and most cordial expression of our profound esteem and gratitude to this our most distinguished colleague. I therefore beg to hand in a proposal which I am sure will find many seconders, and which I am very sorry that I cannot have the honour of proposing personally. That this meeting having received an intimation from Mr. Walter Rye of the fact that he desires to resign his position upon the committee of the Norfolk and Norwich Archæological Society, desires to express to Mr. Rye its cordial thanks for all his invaluable services in the cause of archæology during many years in the county of Norfolk, but they cannot accept his resignation."

It was decided not to accept Mr. Rye's resignation.

Norwich Church Brasses.

Mr. Bolingbroke said a gentleman recently wrote to him stating that he had two or three fragments of brasses from Norwich churches which he (the speaker) might be desirous of acquiring for the Strangers' Hall. They were not receivers of stolen property at Strangers' Hall, however, but he bought the brasses and communicated with the committee of the Society, who decided that they should be handed over to the clergy of the churches to which they belonged. The first one was a brass in memory of John Caston, a citizen and alderman of Norwich, who died on January 3, 1483, and who was buried in St. Lawrence Church, and there was no doubt that the brass came from that church, although it was not mentioned in Blomefield. By his will the gentleman to whose memory the brass was erected gave forty shillings for making a new perk in the church. The other two were scrolls belonging to the big brasses in St. John Maddermarket Church. One formed a portion of the brass of an abbot, and the other represented a portion of a knight in armour and part of a lion.

The first brass mentioned was presented to the Rev. C. B. P. Ramsey, the rector of St. Lawrence, by the President, who said he had great pleasure in handing the brass, duly mounted, on behalf of the Society. It un-

doubtedly belonged to that church, and he hoped it would be replaced there. Just now two or three city churches had got out of repair and he saw it was proposed to pull them down, but he would like the citizens of Norwich to carefully consider whether they were not trying to do away with what was a very important and valuable asset in the possession of these churches. A great many visitors came to the city in the summer time, especially Americans whose forefathers came from Norwich, and who liked to come to the place where their ancestors were born and married, and where some of them died. Those people brought a lot of money into the place, and if these relics which were perhaps often more interesting to outside than to citizens, were destroyed, it would be a great loss to Norwich. Americans, who had local associations, were very proud of these ancient relics.

The Rev. C. B. P. Ramsey, in returning thanks on behalf of his churchwardens and himself, remarked that he felt very strongly about the preservation of their ancient churches, and was at the present time restoring St. Gregory's Church, of which he was incumbent. Towards the cost of this work a further sum of 140*l.* was required, and perhaps some members might assist him in the way of funds.

The President: Although we can give away brass, I do not think we have much gold to give away.

Replicas of the missing rose-water dish and ewer, presented to the city by Archbishop Parker, were on view, and Dr. Bensly gave a few interesting facts regarding these pieces of plate. The replicas were made from drawings of the originals in the possession of Mr. Walter Rye, and were presented by Mr. Geoffrey Buxton and various past mayors and sheriffs of the city.

Sir Peter Eade expressed their thanks to Dr. Bensly for having initiated the movement for the reproduction of these lost pieces of plate.

The Roman Occupation of Norfolk.

The Rev. H. J. Dukinfield Astley, M.A., Litt.D., then read some "Notes on the Ninth Iter of Antoninus, with special reference to the sites of Sitomagus and Venta Icenorum, reconsidered in the light of Tabula Peutingeriana," in which he maintained that, according to the data of Antoninus's Itinerary and the Tabula Peutingeriana, Caister and Thetford are the sites of Venta Icenorum and Sitomagus, in harmony with the views of the older antiquaries, as opposed to modern theory, propounded principally by Dr. Raven, which fixes Norwich and Dunwich as the sites. As Dr. Raven pointed out, the old antiquaries, as Camden and Sir Thomas Browne, unhesitatingly pronounced for Caister as the site of Venta Icenorum, but for the next site in the Itinerary, Sitomagus, they had to follow a deflected line to the east or west. The old antiquaries followed the westward line, although they differed as to the site, but before Dr. Raven he could only find three writers who took the eastward line, and fixed upon Dunwich as the site. This identification had been widely accepted in modern times, though none had explained the reasons for their choice so ably and learnedly as Dr. Raven. That gentleman would identify Venta Icenorum with Norwich rather than with Caister, on the ground that the name indicated a British settlement, and previous to the Roman occupation, and that in this respect Norwich Castle, with its British earthworks, contrasted most favourably with Caister in its low situation near the river Tas, which was not at all in the position of a British town. He continued:—"Then there is the form of the Caister camp—rectangular, without any sign of Icenian earthworks on which Roman walls might have been raised. So far as mileage is concerned either site might serve. . . . Finally, if Caister be Venta Icenorum where can we place the Ad Taum of Peutinger's Tabula, which is certainly much later than the Itinerary? Tasburgh, in spite of the temptations caused by its name, will not serve for Ad Taum." He (Dr. Astley) submitted, however, that there was no place which suited the data of both the Tabula and the Itinerary in respect to Sitomagus so well as Thetford, and that Dunwich was at any rate ruled out. How any one with the Tabula before them, and the inland progress of the route so clearly marked could argue on the basis of the Tabula, as against the Itinerary and the older antiquaries, for the position of Sinomagi on the coast, as Dr. Raven and so many modern antiquaries did, passed his comprehension. Whatever grounds there might be for fixing it at Dunwich, the data of the Tabula was dead against it. Arguing that the name Venta Icenorum meant simply the market of the Icenii, Dr. Astley said they must look for such a site not in a tempting place provided with

British earthworks, but in a locality where everything would prove its importance during the period of the Roman occupation. Where would they find a more fitting situation than that of Caister? That Caister was a place of importance under the Romans was proved not only by its mighty camp and massive walls, which bespoke the size of the garrison maintained within it, but by the remains of Roman residences which were found in the neighbourhood; and that it was a place of great commercial activity was proved by repeated and important finds of Roman coins, besides ornaments, pottery of various descriptions and other things at or near the camp. They concluded therefore on every ground of right reasoning that Venta Icenorum, the market town of the Iceni, was to be located where the older antiquaries placed it, viz. at Caister, and not at Norwich. What Norwich was to-day, Caister was in Roman times, and as they saw the busy crowd thronging the Norwich streets on a Saturday they could repeople the deserted camp and field of Caister with the crowd of country folk bringing their wares, and the merchants from the south buying and selling, and picture to themselves something of the varied scenes and bustling life of Venta Icenorum in these far-off days. At Ad Taum, which they located at Tasburgh, they found the remains of a good Roman camp twenty-four acres in extent, and following the Roman road through Stratton they turned to the westward, following the bend indicated in the Tabula, and passing through Banham and Kenninghall along the line of a road still known as Ickneild Street, which might very well mark the route of the Ninth Iter, they arrived at Thetford, the Sitomagus of the Itinerary and the Sinomagi of the Tabula. This was a more direct route to London than the coast line favoured by Dr. Raven, and took them past places which were of some note in Roman times. Dunwich did not rise to any importance until Anglian times, whereas Thetford provided just the site which the Romans would fix upon for a station. To his mind the data of the Itinerary and the Tabula, together with the considerations which he had adduced, all pointed to Thetford as the true site of Sitomagus, and to the theories of Dr. Raven being "needless, baseless and untenable."

Mr. J. J. Coulton, as one who had given considerable attention to the subject, expressed himself as entirely in accord with the opinion of Dr. Astley. He believed that Norwich was not the Venta Icenorum, but that Caister was. Caister was washed by the river Wensum, whereas Norwich was washed by the Yare, and Wensum received its name Venta, as Caerwent and Winchester also did.

The proceedings closed with the usual votes of thanks.

WESLEYAN CHURCH HOUSE.

THE Trustees of the new Church House at Westminster have chosen Messrs. Lanchester & Rickards, of Bloomsbury, as architects. The decision of the Trustees, says the *Methodist Times*, was unanimous, and after it was come to Sir Aston Webb, the architectural assessor, declared himself of the same opinion. The designs of Messrs. Lanchester & Rickards were deemed the best of those sent in, both on the ground of general architectural ability and of internal arrangement. It is expected that all the competing designs will be exhibited shortly at City Road. Some time must elapse before tenders can be asked for and the foundations put in, and it will, of course, not be for a considerable time that the actual building will be put in hand. The building, as designed by Messrs. Lanchester & Rickards, will bulk well in relation to the group of buildings surrounding it. It is loftier than the Westminster Palace Hotel and the Westminster Hospital, and will confront the great Abbey not with any rivalry of style, but with a massive edifice well worthy of the conspicuous site which it is to occupy.

It is thought that the cost of the building will amount to 140,000*l.*, and the style of architecture chosen is the Renaissance. In working out the design its proportions and massing have been allowed to develop from the necessities of the case, the form of the large hall being naturally the dominating influence, while the expressed desire for a building of monumental character has been an important factor in determining the treatment of the detail.

It has been considered not inappropriate to base the design on the style belonging to the period at which John Wesley commenced his life work. Applied ornament and sculpture have been sparingly used, in view of the austerity of the design, and some suggestion has been found in the

verses beginning, "Wherefore take unto you the whole armour of God" (Ephesians vi. 13-17). Figure-work has been almost wholly avoided, as unsuited to the purposes of the building. It is suggested that in the middle of the Tothill Street frontage a statue of John Wesley should be placed in the recess formed by the building.

The form of the external dome has been decided on with a view to differentiating the building from one of a strictly ecclesiastical character such as a circular dome would suggest.

The interior of the building will be arranged as follows:—

Basement.—Tea-room to seat 550 and another to seat 450. Ladies' cloak-room and lavatory, kitchen service-room, heating chamber and tea offices. The mezzanine, at ground level, will comprise thirteen offices, two strong rooms and a lavatory. The ground floor will comprise a conference hall to seat 300, reading-room, library, small hall, four committee-rooms, librarian's room, vestry and two lavatories. The mezzanine above the ground floor will contain twelve offices and two lavatories.

On the first floor will be the assembly hall, seating 1,401 people, cloak-rooms and lavatories, two vestries, a reception-room and eleven offices. And on the second floor will be the entrance to the galleries, accommodating 1,155, making a total seating accommodation for the assembly hall of over 2,500. The librarian's house will be on the third and fourth floors.

AN EARLY COROT.

ONE of the paintings presented by the Prince of Wales to the Dublin Museum Art Gallery was a landscape by Corot, the French painter. The work was known, as doubts had been raised about its genuineness, and it was ascribed to an Hungarian artist. The following letters from London experts support the belief that it came from Corot's hand:—

"120 Pall Mall: June 6, 1905.

"Dear Sir,—Having carefully examined the little landscape with figures and a boat, I have no hesitation in pronouncing it to be a genuine early work by J. B. C. Corot, painted about the year 1825.—Yours faithfully,

"THOS. WALLIS."

"The Marlborough Gallery, 53 Pall Mall:

"June 2, 1905.

"I have examined the small landscape submitted to me to-day, and it is my opinion that it is an early work by Corot. From great experience in such matters, I am perfectly aware that the early works by most of our esteemed painters have little of the characteristics of their advanced and more matured.

MARTIN H. COLNAGHI."

"39B Old Bond Street: June 6, 1905.

"Dear Mr. Lane,—I have to-day seen the picture signed in full by Corot, and upon which I hear some doubt has been thrown in Dublin. I am of opinion that this is a perfectly genuine work of the master. It is ridiculous, in my opinion, to say this picture has been painted since 1877. It was, I think, the work of Corot when very young; the work of a clever boy. It is interesting to connoisseurs as showing how very carefully the artist worked in his youth, and I have no hesitation in saying it to be a genuine work.—Yours very faithfully,

LOCKETT AGNEW."

"177 Piccadilly, London, W.: June 6, 1905.

"Dear Sir,—With regard to the little panel picture attributed to Corot which you have to-day submitted to me for my opinion, I have to say I have no doubt as to its authenticity, and that it is a very early example of that artist, and painted at the beginning of his career.—Yours faithfully,

AYERST H. BUTTERY."

An Appeal has been made for funds towards the resumption of explorations at St. Augustine's Abbey at Canterbury, which have been in progress during the last four summers. The results hitherto obtained include the discovery of the crypt of the Early Norman church with its three apsidal side chapels, each having its altar still *in situ*; the walls of the north transept, the chapter-house and the infirmary chapel. If funds are forthcoming excavations will be made on the eastern part of the nave, including the ritual choir, which still lies under a great mound of earth; the chapter-house is not yet cleared out, and no work has been done on the dormitory range and other buildings.

NOTES AND COMMENTS.

THE Red Book of the Architects' Benevolent Society has been again issued, although last year's edition was the means of adding only seven additional subscribers. During the past year sixty-six applicants were assisted and ten pensioners received annual grants. In that way 950*l.* 19*s.* was expended. The year's subscriptions amounted to 525*l.* 16*s.* Fortunately, the dividends on the company's stock amounted to 398*l.* 10*s.* 3*d.* There has been a deficit of 47*l.* 9*s.* 1*d.* For so important a profession the figures are not satisfactory, and, "in view of the comparatively small number of architects in active practice who contribute to the Society, the Council make an earnest appeal for more liberal support." Only 5 or 6 per cent. of the members of the Royal Institute subscribed to the funds. The Society needs no eloquence in order to describe its utility. At a time like the present there is likely to be an increased number of applicants for assistance, and unless the subscribers are more numerous they cannot be relieved without drawing on capital.

SYRACUSE has so long a history and was at one time so important as a city and a seaport, it seems falling from the sublime to the ridiculous when we consider it in a vice-consul's report. A great quantity of the lemons and oranges which are used in the United Kingdom are shipped at Syracuse. But what is more interesting to contractors is that the exports of asphalt have considerably increased. During 1904 the quantities shipped from Syracuse and Mazzarelli were about 75,542 tons, of which 65,320 blocks of compressed bitumen, equal to 1,633 tons, and 69,100 sacks of pulverised asphalt rock, equal to 3,455 tons, were sent to various destinations. At Ragusa (the asphalt mining district) another new steam factory for the extraction of bitumen from the asphalt rock and compressing into blocks, as also for pulverising the asphalt rock, is being built by the United Limmer and Vorwohle Company; and important discoveries of asphalt rock were made at Scicli, where the mines are being worked and the asphalt extracted is brought to Syracuse for exportation. The quantity of asphalt obtained by Great Britain was 4,923 tons. As the utility of the material is being more generally recognised, it is advantageous to have supplies from a great many districts.

It is anticipated that the danger which threatened French churches will be minimised. One party of the citizens desire to see them converted into museums or into warehouses. And to secure the fullest liberty for the secularisation of the buildings it was proposed that the tenure of them by the congregations should be limited to a very few years. Not a word was said about renewals of the leases. The Commission appointed to report on the subject have come to the conclusion that the proposed arrangements would be unsatisfactory. It has therefore been suggested that the leases should be renewable so long as the stipulated conditions were carried out. It has yet to be seen whether the opposing parties will recognise the advantages of the new proposals or will have to submit to a majority on the other side. The fear of eviction is not pleasant to contemplate even by those who aspire to suffer in order to display their zeal, and it is not unlikely that if tenants were often changed the churches would suffer.

IRISH gentlemen are not credited with any desire to purchase pictures by Irish artists. If they invest it is generally in works which were produced in some other country. MORLAND appears to be a favourite, and the loss of two pictures which were said to be by him formed the subject of a trial in Dublin a few days since. The plaintiff, a foreigner who dealt in pictures, made an agreement with a London dealer to let him have the two paintings on the sale or return principle. There were some doubts about the genuineness of one of them,

and in consequence the trade price was 50*l.* each. The two pictures were wrapped in a rug, and the travelling dealer brought them to the terminus of the Great Southern and Western Railway, as he expected to send them to a gentleman in Mitchelstown. One of the porters detected them, and said that as the pictures were not personal luggage they would have to be paid for. The pictures, it was alleged, were not to be found on plaintiff's arrival at the station, and he had not since seen them. The railway company maintained that the value of the goods had not been declared, for, if so, he would have had to pay an insurance of 10*s.* The guard of the train expressed the belief that the dealer had himself taken the parcel. The jury found for the plaintiff, and assessed the value of the pictures at 65*l.* There was no doubt the plaintiff had stated that the parcel contained pictures, but had not stated the value placed on them. The case is curious as showing there were irregularities on both sides, and owners of pictures should be warned that railway companies are not infallible in their arrangements.

THE French have claims on Egypt owing to the great services which were rendered by CHAMPOLLION at the beginning of the last century—a time when that ancient kingdom was considered to be an unsolvable mystery. The interest has not been lost, and an exhibition which is now open in the Petit Palais in Paris reveals that the explorations at Antinoë by M. GAYET have been crowned with deserved success. There is originality about a figure of a gladiator, who evidently upheld his reputation by the richness of his costume. There is also a charioteer who was buried with his whips, his goad and the reins he used. The mummy of a woman who had charge of the images of OSIRIS also has interest. Evidently Greek influence was strong in Antinoë, for a piece of stuff resembling muslin has been delicately painted with scenes from the myth of BACCHUS, some of them being different to those accepted by the Greeks. There are two portraits in wax colours which from their reality are sufficient to confute those who believed that the Egyptians cared only for conventional forms.

GAIETY RESTAURANT.—MASONIC TEMPLE.

ON the right of the first floor of the New Gaiety building will be found the Masonic Temple and Banqueting Hall. Between these is the Tiler's Room, which is of sufficient dimensions to accommodate a large number of persons. From it on the western side is the entrance to the Masonic Temple, the design for which has been based on Byzantine Church work. This room is of noble proportions, being 45 feet in length, 27 feet in height, and 26 feet in width, with an apsidal end and barrel roof over (supported on sixteen Sienna Scagliola marble columns) richly decorated with emblematical paintings in the semi-dome and on the semicircular end above the organ. The whole is adapted for every conceivable branch of the Masonic world. The Temple is decorated and furnished in the Byzantine style, and has a carpet of rich blue, curtains of pearl plush surmounted with embroidered palmettes surrounding Masonic emblems. These, with the design and colouring of the vaulted ceiling, accord with the artistic subject paintings of angelic figures representing respectively "The Star of the East," bearing a radiant star in the outstretched hand, "The Spirit of the West," bearing the Western crescent moon surrounded by seven stars, and "The Spirit of the South," bearing the noonday sun. As a background is utilised the starry sky, the Tree of Life bearing bursting pomegranates, and two birds, an early symbol of the Resurrection.

THE EXCAVATION OF THE OLDEST TEMPLE OF THEBES.*

IT will probably be within the recollection of the members of the Society of Arts that some ten years ago the Egypt Exploration Fund carried out the complete excavation and conservation of the great temple of Deir el-Bahari, on the western bank of the Nile, at Thebes. This great work, the most important of its kind carried out by the Egypt Exploration Fund, was entrusted to the hands of Professor Naville, the senior excavator of the Fund, who had already proved his skill by the discovery of the store-city of Pithom, and by the unravelment of the probable route of the Exodus. This was the work with which the Egypt Exploration Fund made its *début*. Ever since its foundation, twenty years ago, the Fund has carried out systematic excavations, chiefly associated with the names of its chief excavators, Messrs. Naville and Petrie, and it may with truth be said that no other private society has ever done so much for the furtherance of our knowledge of the ancient world. Its work has varied in character from year to year as the occasion needed: that at Deir el-Bahari is an example of what the French call *déblaiement* on a large scale, the complete clearance of an ancient site on which considerable remains existed above ground, usually those of a temple. Only those who remember what Deir el-Bahari was twenty years ago, covered with high-piled mounds of *débris* and encumbered with the ruins of the Coptic monastery from which it took its name, can realise the heavy nature of the work which the Fund undertook to carry out there. Heavy as the work was it was worth doing, for the temple, though half buried, was known to be not only unique in Egypt as regards its plan and the beauty of its sculptures, but was of great interest on account of the interesting personality of its founder, the great Queen Hatasu, or Hatshepsu, of the eighteenth dynasty, the queen regnant, who reigned as a king and was depicted as a king in masculine attire. The work was worth doing, and its result is well-known to every modern visitor to Egyptian Thebes. As it stands completed and conserved by the skilful hands of Mr. Somers Clarke and his associates, the great temple of Deir el-Bahari is a lasting monument of the Egypt Exploration Fund's work in Egypt.

But the work at Deir el-Bahari did not cease with the excavation of this temple. When that was finished, a large tract to the south of it still remained untouched and unexplored. This tract is now being excavated for the Fund by Professor Naville, and it is this excavation, in which I have taken part with M. Naville for the past two seasons (assisted during the second season by Mr. E. R. Ayrton and Mr. H. Garnett-Orme), which has resulted in the discovery of the oldest temple at Thebes. This is a second temple, side by side with the first, but a thousand years older than it. It dates to the time of the eleventh dynasty, about 2500 B.C., to a period and a dynasty of which very little is known. It was to be expected, therefore, that this discovery would tell us much that would be entirely new with regard to the architecture and art, perhaps also the history, of an obscure epoch. This expectation has been abundantly justified: we have learnt much that is entirely new, and the Fund has made discoveries of the greatest interest, which I will now describe.

From several indications it was considered probable that a building of the eleventh dynasty existed at Deir el-Bahari, but it was not supposed that anything much would be found of it. Finely furnished tombs of the same dynasty had been found here by M. Naville during the course of the preceding excavations, and it was hoped to find still more of the same kind. Both temple and tombs have been found, but, contrary to expectation, the temple has turned out to be far more important than the tombs. The temple is much larger and in better preservation than it was expected to be; the tombs, as far as we have explored them (the excavation is not yet completed), prove to have been violated and robbed by the tomb thieves of ancient days, but have nevertheless yielded us objects of the eleventh dynasty which were buried with the dead, in good preservation, and one very good find, a magnificent white limestone sarcophagus of unique workmanship.

The relation of the tombs to the temple is interesting. They are contemporary. The temple was a mortuary chapel or funerary temple, dedicated for the deceased king Mentuhtetep III., the most important monarch of the eleventh dynasty, and the first great Pharaoh who exer-

cised his dominion from Thebes. It was in his epoch that Thebes became what we should call the "capital" of Egypt. The tombs are excavated within the precincts and beneath the actual pavement of the temple. They were the last resting-place of a series of priestesses of Hathor, the tutelary goddess of the place, who was venerated in the form of a cow. These priestesses were contemporaries of Mentuhtetep and other kings of the eleventh dynasty (one at least of whom is a new discovery) who are commemorated here, and one or two of them seem to have been actual queens: all are described as "favourites" of the king. Other great personages of the court were buried in the immediate vicinity of the temple, which seems then to have been a sort of eleventh dynasty Westminster Abbey; still other great personages of the time are commemorated in the inscriptions on its walls.

The temple stands upon an artificially squared platform of rock, rectangular in shape. In the centre of this platform is a square mass of building, which seems to be the core of what was originally the base of a pyramid. It is built of heavy rough nodules of flint. In one place only, the north-western corner, is part of the original facing of fine white limestone blocks preserved. The erection was originally pyloniform; remains of the heavy cornice and the toruses at the corners have been found. Above this, it is most probable that a small pyramid was erected, as we see a pyramid depicted above a base of this kind in the representations of tombs in the "Book of the Dead." This would agree with the fact that the tomb-chapel of King Mentuhtetep is spoken of in the "Abbott Papyrus" (the *procès-verbal* of an inquiry into tomb robberies in the reign of Ramses IX., about 1100 B.C.) as a *mer*, that is to say, a pyramid-tomb. It cannot have been an altar, as has been suggested, as there is no way up to it by steps or ramp from the platform. Yet that it was a real pyramid covering the actual burial-place of the king is doubtful, as we shall see later. The central erection was surrounded by a colonnade of three rows of small octagonal pillars, each originally 12 feet in height. The intercolumniation is very narrow, as they measure only about 7 feet from centre to centre of the bases. Each is inscribed with the name of King Mentuhtetep. This colonnade or pillar-hall was surrounded by a wall, the sides of which were decorated with coloured reliefs representing the king's coronation and celebration of the Jubilee festival ("sed-heb"); processions of warriors and magnates, among whom figures a well-known dignitary of Mentuhtetep's reign, the Vizier Kheti; men driving cattle, gathering seeds, reaping corn and building boats, and other scenes appropriate to the funerary chapel of a king at this period. I shall refer again to these reliefs at the end of this paper. Typical specimens of them will be exhibited at the annual exhibition of the Egypt Exploration Fund at the rooms of the Society of Biblical Archaeology, 37 Great Russell Street, in July. Outside this wall was a colonnade of square pillars, of which only the bases remain *in situ*. This seems to have been an open colonnade, looking out upon the court at a lower level, which is shown on the left of the screen. The open colonnade must have given the whole building something of the aspect of a Greek peripteral temple. The court is artificially cut out of the rock, like the platform. The rock wall, about 15 to 18 feet high, was masked by a wall of magnificent limestone, blocks of which a considerable stretch remains in position. The whole of this court was excavated during the first season's work. It separates the two temples. The whole building was approached from the centre, from the east, that is, by an inclined ramp or processional way, flanked on either side by colonnades, as in the later temple of Hatshepsu. From this it would seem that Hatshepsu's architects took the idea of a platform approached by a ramp flanked by colonnades (but no more; the plans of the buildings on the platform are perfectly different in the two temples), from the older temples which we have discovered. This is a most interesting probability. Coming back to the west end of the pyramid, we see the remains of a colonnade. Here were found the tombs of the chief priestesses, with in front of them the shrines in which offerings were made to their *kas*, or doubles. Many fragments of these shrines, which were embellished in the high reliefs, delicately coloured, have been found and brought back to England. The cavetto mouldings of the cornices, with inscriptions above them giving the names of the dead priestesses, are of remarkably fine workmanship.

I shall now proceed to describe the general progress of the excavations from the commencement to the suspension of work at the end of last season. This suspension does

* A paper read by Mr. H. R. Hall, M.A., before the Applied Art Section of the Society of Arts.

not mean the end of the work. Two-thirds only of the temple have been as yet excavated; one-third remains to be done. A wall at the western end of the platform turns inward towards the cliffs, and pillars and pavement, now covered again by a fall of rubbish, seem to lead further west towards another shrine, probably the king's own shrine, and if we may judge by the analogy of the priestesses' shrines, which lie immediately in front of their tombs, perhaps the king's tomb itself.

The chief problem in dealing with an excavation of this type is the removal of the rubbish, and the disposal of it when removed. It is impossible to throw all the stuff simply behind one as we work forward, planning as we go, and partly covering up again what has been investigated and planned. The object is systematically and totally to uncover—*déblayer*—a building, to free it from the rubbish which has accumulated above it during the lapse of time, and to free it totally, so that it can be kept for all to see and study. To do this properly in a confined space, such as that at Deir el-Bahari, which is surrounded on all sides by cliffs, and partly filled with already excavated temple buildings which must not be again covered up, is difficult. In an open space, as at Abydos, it is possible simply to heap all the rubbish up around the area excavated, but at Deir el-Bahari everything must be carried away some distance to the east, to a tract which is bare of ancient remains, and where rubbish may be shot with the certainty that it will not need to be again removed. To do this it was necessary to have a small Décauville railway, which could carry away the stuff and tip it about a quarter of a mile or more away. The tips are of the same construction as those used in chalk-pits to dispose of the useless chalk. The waggons are run and the actual excavation done by local workmen. These men dig out the rubbish, which, as the whole area is desert and is never reached by the inundation, is loose and dry, and largely consists of stone *débris* and wind-blown dust (not fine sand, as the geological formation of the district is limestone), and fill the baskets, which are carried by the boys, two or more of whom are assigned to each man, to the waggons. The very looseness and dryness of the rubbish, while it renders the actual uncovering of the buildings buried in it easy and expeditious, and has preserved the condition and colour of the antiquities found intact and fresh as in the days of their making, yet has its dangers for the men working in it, especially when the mounds to be removed are high. As the men cut away on the rock or pavement level large stones are liable to come down with a run, or a heavy fragment of column or architrave may threaten to crash down on the heads of the workers at the next blow of the *turya* or *fass* (the small hoe with which all the digging of the Egyptian fellahin is done), or a mass of wind-blown dust, left jutting out into the air by the workmen cutting from under, may suddenly break off and fall with weight sufficient to stun a man who is caught by it. To avoid this, when the undercutting has gone far enough for safety, the men are sent up to the top of the mound, and a process of cutting down from the top is carried out which abolishes the overhanging mass and makes a continuous slope again. Then the cutting from under is resumed, followed by the cutting down from the top, and so on in regular succession, the heavy antiquities found being taken out, and the rubbish searched for small loose antiquities before being carried off by the basket boys to the waggons, which are run down in trains of three to the tip, where they are emptied, and a final process of search is carried out before the stuff is raked off, in case anything "*maktub*" (inscribed) may have escaped our notice at the actual place of digging and have been put into the waggons by mistake. The process of cutting from above or a heavy fall of *débris* usually sets up a tremendous cloud of dust, which is sometimes as thick as a London fog.

The work was begun in November 1903 with a force of about thirty men, each with two boys. The plan was to shave off from the north side of the mounds, that nearest to the great temple, a band of the width of the number of diggers necessary to fill one train of waggons, while the other was engaged in tipping the previous load. All this has to be very carefully thought out, and the number of diggers (and so the extent of the tract excavated) necessarily depends on the number of waggons employed and the distance of the tip from the work. At the same time another set of men were put to lower the height of the mounds from the top, the stuff removed being taken a short distance away from the excavated area by boys without the aid of the waggons, which

were kept on the flat rock level. This set of men removed a large mound 25 feet high from above the place where the north colonnade of the temple lay; we had then, of course, no inkling of what lay below. The work with the waggons soon resulted in the discovery of our first "find," an inclined plane or ramp of stone, of eighteenth dynasty work, which led up to a flat platform, apparently unfinished, which was probably intended for a large altar or shrine-base. The complete exploration of this seeming unpromising, it was left to be finished later, and the work was pressed round it into what was soon found to be an open court bounded on the north by the Hathor shrine of the great temple, on the south by a wall of splendid stonework, which proved to be but the mask of a solid mass of rock, carefully squared, about 15 to 18 feet in height. At this height the rock ceased, and was found to be artificially squared on the top as well; further, on the top was a pavement. We had, in fact, reached the platform of the eleventh dynasty temple which has already been described. No inscription had as yet told us that this was the temple of Mentuhtetep, but on its first appearance Professor Naville had diagnosed the wall, with its splendid blocks of finely squared and jointed limestone, much larger and finer than any in the eighteenth dynasty temple, as being of Middle Kingdom work, and our further discoveries soon proved the correctness of his diagnosis.

The work now to be done was the clearing of the facing-wall from below. The work of clearing this court was continued until, after the wall had been uncovered, with its base, for a distance of 120 feet in a westerly direction, it was brought to an end by the discovery of a transverse wall of the same character, running off at a remarkably acute angle ("like the bows of a boat," the workmen said), north-east to the Hathor shrine, and passing away under it. The Hathor shrine had been built over it. This wall has its coping-stones in place for some little way, and its stonework is among the finest ever found in Egypt. Where this wall was broken down in order that the wall of the Hathor shrine might be built up over it, a considerable gap was left in the latter, which we had to fill up, in order to insure the safety of the Hathor shrine above. This work of restoration in dry masonry was carried out on the advice of Mr. Somers Clarke by Mr. Howard Carter, then chief-inspector of antiquities at Thebes, who in order to enable masons to work freely in the gap to be filled up, held up the overhanging wall not only by shores but by a long and heavy beam below suspended as a cantilever from a chain anchored round one of the pillars above, which formed an arrangement to grip the suspended stone wall and hold it fast while the masons worked below. If the pillar had given way the whole apparatus would have come down with a run and possibly the wall too, but it did not give, and the operation was successfully accomplished.

Meanwhile the uncovering of the platform had been begun, and a day or two's work showed that it ceased suddenly to the east of the eighteenth dynasty boundary wall of the court. At this juncture Professor Naville was obliged to return to Europe, leaving me in charge of the excavations. He missed by one day the confirmation of his belief that we had found the sixteenth dynasty temple, in the discovery of the first pillar of the northern lower colonnade, which was inscribed with the personal name of King Mentuhtetep III., the builder of the temple. Next day a second pillar was found, inscribed with the king's second or throne name, Neb-Kheru-Ra, or Neb-hapet-Ra, and before sunset a third, with the Mentuhtetep cartouche, had shown its head amid the rubbish. Simultaneously companion pillars appeared a few feet east. It was evident that we had a colonnade of square pillars of the same type as the colonnades of the great temple of Hatshepsu, but on a smaller scale. The facing-wall of the colonnade, masking the rock-platform, had also the same batter or slope as the colonnade facing-walls in the great temple. Further it was sculptured in the same way; large blocks, with portions of a relief depicting a procession of boats, were found *in situ*. There were thirteen pillars to each of the two rows of the colonnade; they were originally 11 to 12 feet in height and are a little over 2 feet square. All are broken off short at a height of from 4 to 7 feet above the ground. The upper portion of only one was found; this was hoisted into place this season.

The excavation of the colonnade ended with a cross-wall, and simultaneously on the platform above a fine gate-threshold of red granite was found in line with this wall. The cross-wall was a ramp or processional way leading up to the east gateway of the temple or the platform. This

threshold is finely polished granite, and measures 9 feet by 5 feet. The socket in which the door turned and also the side-run or channel by which the gate could be bodily removed from the socket and replaced, are perfectly preserved.

This threshold led into the hall or colonnade of sandstone octagonal pillars which has already been mentioned. The arrangement of this marked the first divergence from the plan of the great temple. Hatshepsu's architects had evidently copied the ramp and its flanking colonnades only.

Here the first season's work of two months and a half, at an expenditure of 500*l*. only, ended, leaving us fully aware of what we had to do in the ensuing season. Instead of working from the flank as we had done, it was necessary to make a direct frontal attack, with a force of about 200 men and boys, by driving a trench up to the side of the ramp, freeing it and making a direct way into the already discovered north colonnade, and into the southern colonnade which ought to exist on the other side of the ramp. This was done, and eventually the ramp, when freed, was built up on its base-stones in its original form. The original was almost entirely destroyed, but some of the wooden beams with which it was paved were found and remain in place. The south colonnade was found, but is much destroyed.

The next thing was to investigate the nature of a peculiar appearance which had been noted at the end of the former season's work, which seemed to show that the centre of the platform was occupied by a square stone building, perhaps a pyramid. This year's excavations have shown us, as I have said, that this was apparently the base of a small pyramid. On each side of it are the hall or colonnade wall with octagonal pillars and reliefs, already described; beyond it are the shrines of the priestesses; beyond them, and also without the inner wall in the open colonnade on the north side, are their tombs.

The rubbish on the top of the pyramid-base was cleared off by Mr. Ayrton after I left, and Prof. Naville, who then arrived, opened it from the top, finding no tomb, but instead a very peculiar pavement of what is pronounced by Prof. Schweinfurth to be rock salt. The shoot, devised by Mr. Ayrton, by which the rubbish was shot from the platform into the waggons in the lower colonnade, effected a considerable economy in labour and expense.

The tombs of the priestesses and the method of clearing them remain to be described. Eleven tombs in all were opened; of these eight were on the platform. Two were incomplete or false tombs. One only (in the court) was the burial-place of a man. Each tomb consists of a rectangular shaft, from 12 to 15 feet, sunk in the platform of the temple and northern court. The pavement of the temple was laid over the tombs, and in one case tree-trunks were placed across the tomb to catch the pavement at important points. At the bottom of the shaft is the entrance to a simple rectangular chamber, closed generally by a brick wall, in one or two instances by stone slabs. In every case this sealing was found broken and the tomb violated by the tomb robbers of ancient times, and after their depredations the tomb had generally been reused by Egyptians of the time of the twentieth dynasty, where "secondary" burials were found in most cases. Enough remained, however, of the original interments to tell us who had originally been buried here and to give us specimens of the original tomb-furniture, &c.

The tomb-chamber itself was just large enough to contain the sarcophagus of white limestone; with the body were found the remains of the models of workpeople, granaries, &c., which are characteristic of tombs of this date. One of these models, of a combined bakery and brewery (the Egyptians made their beer by fermenting bread) is of unique type, and is now exhibited in the fourth Egyptian room of the British Museum. In the shafts of the priestesses' tombs were found the bones of Hathor cows, which had been buried with them. The tomb-shafts were cleared by two or three men, who passed up the baskets to boys mounted on the rungs of a ladder. When the chamber was reached either Mr. Ayrton or myself descended and remained in the chamber with the head *reis* or foreman and a couple of trustworthy men to sift and carefully examine the rubbish for small objects, remains of bead necklaces, &c. These must be removed by one's self in order that the position of the beads may be noted so as to reconstitute the necklace. It is also possible that gold objects overlooked by the early plunderers may be found. The work in the confined tomb-chamber by candle-light, in a temperature of 80 degs., amid the dust and bones of dead Egyptians, and in the reek of the fellahin workmen, which

was perhaps only made worse by the strong tobacco which one smoked to drown it, would not be appreciated by a good many people, who would have no desire to undertake the duties of a professional ghoul. The uninscribed sarcophagi in some of these tombs were not worth removal; but in one case, the tomb of the priestess Kauit, the sarcophagus was inscribed, and was, moreover, of such beauty of workmanship, being unique of its kind, that it was at once seen to be the *clou* of the excavations, the finest thing found, and its removal was at once undertaken. It had originally been lowered into the tomb in pieces, which were fitted together below, so that its removal in the original pieces was possible. I have already mentioned the shrines of the priestesses, which were placed in front of their tombs, and the reliefs which once adorned both them and the walls of the temple. A large number of these reliefs have been brought to England, and will be exhibited in July.

Both these reliefs and those from the wall of the colonnade, already mentioned, are of very great interest as examples of the best art of the eleventh dynasty, which was previously unknown to us. They exhibit to us an art which is evidently in a state of transition. With the fall of the Memphite kingdom Memphite art had also fallen into decadence, and it is the rise out of this decadence, the reaction which produced the fine artistic works of the twelfth dynasty, which we see in these eleventh dynasty reliefs from Deir el-Bahari. Here they are of the awkward type which we have hitherto known as typical eleventh dynasty work, but here again they are equal to the finest twelfth dynasty reliefs. There they show cutting of hieroglyphs in a remarkably high relief, entirely unknown elsewhere, and first found during these excavations, which is of unsurpassed excellence, but there again they are free, if not rough and careless in execution. They present us with a new chapter in Egyptian art, and Professor Naville has in them once again shown us something new in old Egypt. Apart from their artistic interest, there is also a personal interest attaching to these relics of the nascent art of the Egyptian Middle Kingdom, for they are in all probability the work of an Egyptian artist who is known to us and of his school. In the reign of Mentuhetep III., Mertisen was court sculptor and painter. He tells us on his grave-stone that he and his son were the chief artworkers of his time; they formed a "school," in fact. "I know," he says, "how to produce the forms of going forth and returning, so that the limb may be in its right place. I know how the figure of a man should appear walking, and how a woman should carry herself; the poising of the arm to bring the hippopotamus low; the going of the runner. I know the making of amulets which enable us to go without the fire giving its flame on us, or without the flood washing us away. No one succeeds in it but I alone and the eldest son of my body. The Divine has decreed him to excel in it, and I have seen the perfections of his hands in the work of chief artist in every kind of stone, of gold and silver, of ivory and ebony." Now, since Mertisen and his son were the chief artists of their time, it is highly probable that they were engaged to execute the most important works of the king's tomb-temple, and that the best work at Deir el-Bahari is to be ascribed to their hands. Mertisen was very probably the originator of the nascent art of the Middle Kingdom, as his king was the founder of its political power. This fact lends a very special interest to these reliefs.

Besides these, some other most important pieces of sculpture were discovered, and will be exhibited at the same time. Chief of these are six statues of King Usertsen or Senusert III., of the twelfth dynasty, which were found together by M. Naville in the southern court at the end of this season's work. Unluckily the legs are in all cases broken off, but the portraits are but little impaired, and show the king at different periods of his life. The features are marked, being of the type which we now know to be characteristic of the later kings of the twelfth dynasty. Usertsen III. and Amenemhat III. present the best examples of it. Another similar discovery was that of a series of sandstone Osiride figures of Mentuhetep and of a later king, Amenhetep I., of the eighteenth dynasty, who, like Mentuhetep, was venerated as a sort of tutelary daemon of the necropolis of Western Thebes. One of these statues of Amenhetep has been brought back; it is 10 feet high. There was evidently a row of them placed near the ramp, and that they were a remarkable feature of the temple is shown by the fact that a fragment of an eighteenth dynasty stela or funerary tablet depicting them has been found. Another fine find was that of an alabaster head of a cow, of

magnificent work, which will also be exhibited in July. It is of the time of the eighteenth dynasty, and is no doubt the head of one of the figures of the goddess Hathor in the form of a cow, which was venerated in the temple of Hatshepsu. Its horns and ears, which have disappeared, were probably of silver.

Not so many smaller objects have been found this year as last year, which was distinguished by the discovery in the court between the two temples of the dust-heap of the Hathor shrine, containing votive offerings, which had originally been dedicated in the Temple of Hatshepsu, and, when old and broken, had been thrown by the sacristans over the wall into the court, where they gradually formed a regular dust-heap. Many of these interesting objects, consisting of pottery cows, figures of Hathor, bead necklaces, votive eyes and ears for the cure of blindness and deafness, incense-burners, &c., are temporarily exhibited in the North Gallery (Semitic room) of the British Museum. This year, as well as last, large numbers of workmen's mallets and hoes, baskets, a fine copper chisel and a graving tool, &c., were found. They probably date to the time of the destruction of the temple and its partial redecoration by King Siptah, in the time of the nineteenth dynasty, who cut one or two reliefs of himself on the facing-blocks of the pyramid-base and ramp. The smaller boxes of antiquities were transported to the steamer on the river on camel-back, the larger ones on the Décauville railway.

The main interest of the temple, apart from the unexpectedly remarkable character of the eleventh dynasty art which it discloses, lies in the fact that it is the most ancient yet found at Thebes, and is the best preserved of the older temples in Egypt. The pyramid temples excavated by Messrs. Borchardt and Schäfer at Abusir are older, dating to the fifth dynasty, but they are not in such good preservation, nor have they yielded so many antiquities. In connection with them the salient feature of the Deir el-Bahari temple, the central pyramid, may be discussed. In their case we have great pyramids, real tombs, in which the kings were buried, with small funerary temples in front of them. At Deir el-Bahari, under the eleventh dynasty, the temple has so developed that it has surrounded and swallowed up the pyramid, which has shrunk to small dimensions, become atrophied, in fact, and is erected on a pedestal merely as an architectural feature. Probably it does not conceal the actual burial-place of the king at all, but is merely a survival, a sort of pyramidal appendix surviving in the funerary temple.

The actual burying-place of the king may or may not be a rock-tomb behind the temple; the conclusion of the excavations will show this. It is to determine this crucial point that we desire to conclude the excavations as soon as possible, but to do this the Egypt Exploration Fund needs the sinews of war, and it is my hope that a few of those who read this paper may be induced by it to become, if they are not so already, subscribers to the Fund and so help its Council and Professor Naville to complete the work which they have begun. The result in portable antiquities has been and will be a fine return to English and American museums for the small sum, 1,400*l.*, which has been spent on the excavations up to the present time.

ST. MARK'S, VENICE.

THE following memorial will be sent to the Minister of Public Works in Italy by the Society for the Protection of Ancient Buildings when a sufficient number of signatures have been obtained:—

We, the undersigned, having in view the inestimable value of St. Mark's Church at Venice as an historical monument of great beauty, submit to your Excellency that it is of vital importance that the building should be handed down to posterity intact, except for such works as are proved to be necessary to its preservation.

We feel confident that such works as underpinning, consolidation and strengthening generally will be dealt with in a competent manner by the architect now in charge of St. Mark's, but we venture to submit that the substitution of modern reproductions for the old carving, the removal of the mosaics to the tribunes or piers supporting the central cupola, and more particularly the taking up and levelling of the old floor of the church, would not in any way whatever contribute to the security of the building, whereas such works would destroy what have been for centuries its characteristic features.

We submit that no modern reproductions, however

exact, can have the same value as the original work; in the case of St. Mark's the affection of educated people in all countries is concentrated on the stones and marble themselves as they now are and as they have ever been and therefore that their disturbance and renewal would inflict irreparable injury on the historical value of St. Mark's and would destroy the infinite attraction which it still has for those who care for the past.

We therefore appeal to your Excellency to direct that the proposals to interfere with the mosaics, the carving and the floor shall be abandoned, and strictly to limit the work now being undertaken to what is proved beyond question to be necessary to the permanent stability of St. Mark's.

BIRMINGHAM ARCHÆOLOGICAL SOCIETY

A TWO-DAYS' excursion was most enjoyably spent by the members in exploring Glastonbury and Wells. On arriving at Glastonbury, says the *Birmingham Post*, carriages were in attendance to take the visitors to the ancient British crannog, or marsh village, discovered some years ago. The weather was unfortunately cold and damp, and the investigation of excavations in peat mould in a swampy field could not be other than uncomfortable. But the interest in this unique spot is so great that all discomforts were speedily forgotten.

Here, perhaps some 200 years before the Christian era, a community of very doubtful origin, and before the beginning of history in these islands, established their home. The position, unhealthy and inconvenient, had the one advantage of being easily defensible. A plot of firm ground in an impassable marsh was palisaded round, and within the enclosure dwellings were erected and a organised and even civilised life was evidently led. The houses were cribs of oaken piles filled in with "wattle and daub," the very same material of which the first Christian church at Glastonbury was constructed. The floor was clay, and as the marshy ground continually sank it had to be replaced, until in some cases six or seven successive floors are found. There are no traces of sepulture, and indeed the scanty platform won from the marsh afforded bare room for the living.

Yet the inhabitants of this strange village were very far from being barbarians. They had domesticated animals and they farmed land. They seem, indeed, to have lived pretty much as we do—on the flesh of animals bred for food and on the products of agriculture. They were industrious weavers, and to judge by the great number of perforated stone loom-weights and ornamented bone wool-carding combs found, every hut must have had its loom. They were expert jewellers, and the modern safety-pin and split-ring will find here their ancient prototypes. There are even evidences that they mixed their own bronze and smelted their own glass. It is clear also that they were expert boat-builders, and that they had a foreign trade.

Of all this there is now nothing to see on the surface. The sites excavated in the summer are covered up again and are green with grass in the spring. One oak pile was dug up for the instruction of the visitors, and when it was laboriously drawn out it was wonderful to see that the timber, hidden for 2,000 years, had been so conscientiously finished that it had all the appearance of having been turned in a lathe. But even these have to be buried again and left. Quite perfect in the peat which has preserved them for twenty centuries, they shrivel and waste away directly they are exposed to the air.

With the objects of interest discovered in this crannog the local museum is already crammed, and almost the whole life of the inhabitants can there be traced. One bronze bowl discovered is so beautiful that it has been reproduced, and copies are now having a large sale on their artistic merits. It added greatly to the interest of the visit that the Society had the great advantage of hearing full explanatory accounts from Mr. Gray, who is the hon. secretary of the Somersetshire Archæological Society, from Mr. Arthur Bulleid, F.S.A., to whose acumen the whole discovery of this precious archæological record is due, and finally from Mr. Humphreys, whose carefully compiled *resumé* of the whole history of the excavations and their teachings must have made the matter clear to all present.

The evening was spent at Wells, and in the morning the noble cathedral was very carefully examined. As this has been frequently described, it is not necessary here to occupy space with the description of details. Though small, and made smaller in appearance by the complete division of nave from choir, the cathedral of Wells is in some respects

unapproachable. No other cathedral can show such a wealth of exuberant fancy and consummate execution in sculpture as this. The nave, if limited in size, is unsurpassed in harmonious effect, and even the singular inverted arch introduced to strengthen the central tower adds to its charm. The Bishop's Palace and its grounds still form the most complete extant example of their kind, and, apart from all archaeological importance, are in every way charming. The grounds were visited by permission of the Lord Bishop of Bath and Wells, who courteously expressed his regret that he was unable to accompany the party.

After luncheon the remains of the once superb Abbey of Glastonbury were visited. The story of the downfall of this vast and wealthy establishment, as read in its still glorious ruins, is full of pathetic interest, enhanced by its climax in the shameless judicial murder of its last abbot by Henry VIII. and his unscrupulous servant Cromwell. All this was narrated in the very scenes in which the events took place by the Rev. Prebendary Grant, to whom the Society cannot be too grateful, since he devoted to their service the whole time of their two-days' visit to Glastonbury.

It remains only to say that the rather complicated arrangements for the journey were made to work with perfect smoothness by the care of Mr. John Humphreys, to whom a vote of thanks was very warmly accorded. The attendance amounted to thirty-one, a much larger number than had been anticipated.

WELSH NATIONAL MUSEUM AND LIBRARY.

A MEETING of the Privy Council was held on the 8th inst., when the following resolution was adopted:—

Whereas a committee of the Lords of His Majesty's Most Honourable Privy Council was appointed by the Lord President of the Council on the 10th day of February, 1905, to consider and determine certain points in connection with the establishment of a National Museum and National Library in Wales, viz. (1) the place at which each of the two institutions should be established, having special regard to the amount of support which is offered both to the original foundation and to the future maintenance of the institutions by the local authorities, the inhabitants of the several places which may be suggested and others; (2) the probable cost of erecting and of maintaining the institutions; (3) the contributions which may be expected from local sources, either in land, money or buildings, or gifts in kind from whatever quarter, towards the above-mentioned cost; (4) the constitution of the trust or governing body which should be appointed to manage the institutions if established; and inasmuch as their Lordships have considered the subject in accordance with the aforesaid terms of reference, and have carefully examined the documents submitted in evidence thereon, their Lordships are now pleased to report as their opinion (1) that, having regard to the circumstances set forth in the memorandum annexed hereto, the National Museum should be established at Cardiff, and that Aberystwyth should be the seat of the National Library; and (2) that the conference representative of Welsh interests invited by the Chancellor of the Exchequer to prepare the draft scheme which has been submitted should proceed to the application for Royal Charters, under the provisions of which a governing body for each institution shall be incorporated, in whom all moneys contributed by the Treasury or derived from other sources and all lands or buildings or gifts in kind devised or granted for the purpose of either institution shall be vested, and arrangements thereby made for the permanent organisation and management of the two institutions severally and respectively.

Memorandum referred to in foregoing order of report.

The committee having decided that the two institutions should be separate, and that there are preponderant reasons for placing them respectively in Cardiff and Aberystwyth, it remains to indicate the considerations that led to these conclusions.

In the first place, it will be convenient to give a summary of the amount of support, local and otherwise, which has been offered both to the foundation and maintenance of each institution, severally or collectively, under the name of each place that has applied for the establishment of either within its limits:—

I. Aberystwyth (Library).

(1) A site of 14 acres, or so much of it as may be necessary; (2) a sum of 20,000*l.* towards the building

fund; (3) that portion of the college library and collections of books and MSS. that are of national interest; (4) Llanstephan library; (5) Peniarth MSS. (subject to certain prior life interests); (6) Cwrtmawr books and MSS.

II. Carnarvon (Museum).

Carnarvon Castle, to which end the Corporation have voted 5,000*l.*; the Carnarvon County Council, 2,500*l.*

III. Cardiff (Museum and Library).

(1) Four acres at Cathays Park (20,000*l.*); (2) collections in municipal museum and art gallery (38,000*l.*); (3) a capital sum of (7,500*l.*); (4) public subscriptions amounting at present to (32,500*l.*); (5) a $\frac{1}{2}$ *d.* rate under Museums and Gymnasiums Act 1891 (1,940*l.*); (6) collections of books in municipal library (81,766 volumes and 9,118 prints, drawings, &c.) (30,000*l.*); (7) 1,000*l.* a year out of the rates levied under the Public Libraries Acts (1,000*l.*); (8) Salesbury collection of books now in possession of University College of South Wales (5,000*l.*).

IV. Swansea (Museum).

(1) The land and buildings of Royal Institution of South Wales, estimated value (25,000*l.*), or in the alternative, a site in Victoria Park, estimated value (15,000*l.*), and a contribution by the Corporation towards the original foundation of (10,000*l.*); (2) private contributions amounting to (10,000*l.*); (3) proceeds of a $\frac{1}{2}$ *d.* rate under Museums and Gymnasiums Act, 1891, a minimum of (1,000*l.* per annum); (4) contents of museum and books, MSS. records and other documents relating to Wales in the Royal Institution; (5) the Deffett Francis collection of fine art works in the galleries of the Swansea Public Library; (6) the books of reference relating to Wales at the public free library; (7) the Glynn Vivian collection of works of art; (8) private contributions of Swansea and Nantgarw china.

The committee were not insensible to the considerations that could be urged in behalf of placing both institutions under common management in the same town; but whereas the expediency of placing the museum in the largest centre of population, apart from other circumstances, obviously pointed to the county of Glamorgan as its seat, there were cogent reasons, geographical and linguistic, for locating the library elsewhere, and, besides these, much was to be said in favour of the encouragement given to students by the selection of a more healthy and tranquil atmosphere than could be found in the neighbourhood of huge industrial settlements.

In estimating the probable cost of erecting and of maintaining the institutions the committee had before them the draft scheme formulated by selected representatives of Welsh opinion, who had arrived at the conclusion that 50,000*l.* (40,000*l.* for building and 10,000*l.* for fitting) would provide the museum and 20,000*l.* the library, and that the maintenance would absorb 8,000*l.* and 2,000*l.* respectively.

These estimates were, they understand, formed after visits of inspection to the museums of Edinburgh and Dublin, and by the aid of particulars furnished as to the cost and accommodation of those museums, and in the judgment of the persons responsible are not open to much reduction looking to the progressive increase that may be expected from year to year in the contents of both museum and library.

Such expert advice as the committee have been able to obtain tends to confirm the general accuracy of these conclusions, but as regards the initial cost no confident opinion can perhaps be passed on the point until plans and specifications are submitted to competent authority. It may, however, be stated that, so far as can be foreseen and taking the expenditure upon the Edinburgh Museum, which reached approximately 105,000*l.*, as the basis of calculation, an outlay of 50,000*l.* in order to provide adequate accommodation for a collection of objects illustrative of the natural history, antiquities and early industries of Wales, with the addition, as may be necessary, of relative objects from other parts and with due regard to reasonable conditions of expansion, cannot be considered excessive.

The estimates for upkeep and working expenses do not present the same difficulty; that of 8,000*l.* for the museum includes 5,250*l.* for salaries and wages, 1,750*l.* for maintenance of the building and administrative outlay under various heads, and about 1,000*l.* for purchase of specimens, publications, &c. In the provision of 2,000*l.* for the library, a sum that may be easily exceeded, 750*l.* is appropriated to salaries and wages, 500*l.* to establishment charges, 200*l.* to binding and 500*l.* to the purchase of books, but the amount of this item would, it is stated, depend on the possibility of obtain-

ing for the library a statutory claim to copies of works published in Wales.

It being premised that the estimate of 50,000*l.* for the establishment of the museum and 8,000*l.* for its upkeep is sufficient, there appears to be in Cardiff a capital sum already available (besides the value of the site) of 40,000*l.*, and under two Acts an income of 2,940*l.* would be forthcoming, as even if the national library is not in Cardiff, it is presumed that the resources of the Public Libraries Acts could still be drawn upon for the library equipment necessary to a national museum. It may be assumed that further subscriptions will increase the capital sum aforesaid, 20,000*l.* of which might be devoted to provision and the remainder to endowment, thus bringing the income available for the last-named purpose up to at least 3,540*l.*; the county of Glamorgan and the urban authorities in the neighbourhood of Cardiff would probably procure means to supplement this sum by a considerable amount.

In regard to Aberystwyth, the estimated sum for the establishment of the library (20,000*l.*) is already found, but it is represented that a place with small resources cannot provide any endowment, and the Welsh counties generally, the councils of eight of which have pronounced in favour of Aberystwyth as the seat of the library, are in the same case; here, however, in view of the locality finding the whole capital required the problem is confined to the smaller question of maintenance, and with some support from outside it might not be impossible to find the balance in the country.

Although the estimate of the total cost under both heads is preliminary in its nature, and its absolute accuracy cannot be guaranteed, there is no question that the establishment of the museum and library in towns already the seats of well-equipped university colleges should, with intelligent organisation, contribute materially to the reduction of the charges for maintenance which would be necessary under other circumstances.

AMONG THE GREEK ISLANDS.

THE recent Archæological Congress at Athens was followed, says the *Scotsman*, by two extended excursions, in the course of which visits were paid to a large number of the most interesting sites on the mainland of Greece, among the islands and along the western coast of Asia Minor. Those sites on which excavations have recently been in progress were naturally selected for special study, and on this account the central point of the excursions was Crete, where three days were devoted to the sites on which Italian, English and American explorers have for some years past been so fruitfully active. The party had the advantage of the presence in almost every case of the archæologist who, as discoverer and explorer, had been identified with the particular site visited. The carrying out of extensive works of excavation, such as those at Ephesus, Cnossos, Delphi or Thera, means much of good to a locality. Employment is found for large bodies of workmen. There is a brisk demand for supplies. Visitors are attracted to the spot. The leader of the undertaking cultivates friendly relations with the personages of the locality, great and small, and, best of all, a sense of local and historical pride is aroused, so that the Cretans and Samians of to-day talk as familiarly of Minos and Polycrates as of their own demarch. Hence an explorer, who has identified a modern site with some ancient place or name, has appealed to this national sentiment, and won a place in the hearts of the people that no merely material service would secure. Dörpfeld has been maintaining that the Ithaca of Homer is not the modern island of that name, but the neighbouring isle of Leukas, and the Leukadians look on him as the people of the middle ages regarded a saint, who had brought their locality into fame by some miracle or wonder. Freiherr Hiller von Gætringen, who was of the party, is a great favourite in the island of Thera, for he has not only uncovered the site of the ancient city, but has written a large work on the whole island, which is as interesting from the geological as from the archæological standpoint. These considerations, ideal as well as material, combined to produce such expansive friendliness on the part of the people that, wherever the expedition came, it was received with triumphal arches, bands of music, speeches overflowing with Hellenic and local patriotism, repasts elegant as well as abundant, and gifts of cigarettes and of flowers. The last, in carefully compacted bouquets, or flung by fair hands

before the feet of somewhat embarrassed savants, were feature of these golden days of early spring. The charming popular reception was on the island of Leuk the people of which are in high spirits as the fellow citizens of Odysseus. The ordinary traveller in Greece whose relations with the people of a locality are primarily of a financial character, misses these glimpses of a kind demonstrative people, whose unaffected friendliness has been one of the most pleasant features of the tour.

Apart from the social interest of the excursions, the value from the archæological point of view can hardly be over-estimated. It would have been quite impossible for a private party, using the ordinary means of travel, to have visited so many sites in so short a space of time. Olympia, Delphi, Mycenæ, Tiryns, Epidaurus, which, with other places on or close beside the mainland, were visited in the first of the two excursions, are, of course, easily accessible to the ordinary tourist; but Melos, Delos, Cnidos, Theras, old Samos, with all Cretan sites such as Cnossos, lie out of the beaten track; and a visit even to Candia, Didymæ, by Miletus, Pergamon, or Troy, involves some outlay in time and money. The advantage of having small steamers that would go anywhere where needed, and a land party in their own boats on any desired point of rock-bound coast, is obvious, and from this the members of the expedition reaped the fullest benefit. An unprepared descent of this kind on the side of the ancient Cnidos was one of the features of the trip. The steamer approached a bare, rocky headland, descending in a serrated crest from a height of about 2,000 feet to the sea, where a flat spit of land connects it with a craggy peninsula, once probably an island, the curving coast of which forms natural shelter for anchorages. The site is, at the first appearance, utterly deserted, though cattle and goats are seen on a nearer view to be feeding freely on the slopes. As we draw closer to the shore masses of what seemed at first to be craggy rocks resolve themselves into vast piles of Greek polygonal masonry, and the mountain side is seen to be laid out in successive terraces, supported here and there by retaining walls of large squared blocks. A depression in the hillside resolves itself into the hollow auditorium of an ancient theatre. The entrance to the land-locked harbour between the mainland and the former island is seen to be guarded by semicircular towers above great quay-walls of stone. A line, which cuts the apparently almost vertical side of the mountain from the sea beach to the topmost crest, now reveals itself as the track of the massive city wall built of polygonal blocks which, when it has ascended to the crest, follows its jagged ridge down to the shore just on the further side of the harbour. The whole site, now absolutely bare of trees and so steep as to seem almost unclimbable, appears a strange one for a civilised and wealthy city, yet it is only a type of many sites of the kind, such as old Samos, Ephesus and Pergamon, where ground for houses and public buildings has been gained by costly works of terracing, and where the daily intercourse of the citizen must have involved an immense amount of going up and down stairs. We land and find the place only occupied by a few herdsmen, who bring round for sale their coins and broken terra-cottas. There are indications of the older excavations of the time of Sir Charles Newton and Sir Robert Murdoch Smith, but otherwise the place is unviolated and is profoundly impressive. Here, somewhere on this deserted hillside, stood that little shrine, open to the front and back and enclosed in a pleasant plantation of fruit trees and myrtle, within which stood the Cnidian Aphrodite of Praxiteles, to see which stranger came to the place from far and near. These terraces carried temples and porticoes, the clear-cut rectangles of which contrasted with the broken lines of the rocks and the rounded masses of the plane trees and cypresses which the pseudo-Lucian tells us once clothed the now gaunt and naked crags. How the marble columns and pediments must have sparkled from afar across the sea. What life about the two harbours, where the merchant ships were coming and going, and the war galleys lay at anchor. As the sun goes down in amber light behind the indented peaks of the island of Cos, and the violet shades of evening begin to veil the heights, the travellers turn regretfully from a scene that has touched the poetic sense more than any which they have visited.

On sites where the spade of the excavator has been effectively busy the historical imagination is hardly allowed time for this quiet brooding, so clamant are the present interests of the work in progress. Here the prevailing sentiment is scientific rather than romantic. The aspect of

the excavations themselves is as a rule anything but attractive. Most often little is visible but the foundations of walls, while the decorative details and works of art that have been discovered in the course of the operations have been removed to a museum. Without these half the interest of the place is gone. Especially is this felt at the temple of Diana at Ephesus. The site of this, perhaps the greatest and most famous of all the Hellenic shrines, lies very low, and was probably chosen on account of the existence of an earlier shrine, traces of which the recent British excavations have brought to light. It is now almost constantly under water, and presents necessarily a somewhat dismal appearance. Yet sculpture of the highest interest and beauty, as well as a unique treasure in smaller objects, has been found on the spot, and if reproductions of these were at hand the interest of the place would, to the ordinary visitor, be immeasurably increased. British enterprise, embodied in the person of Mr. J. T. Wood, achieved here a signal success, but the place does not produce the effect on the spectator that one would desire. It is a little disappointing, too, to find so much Roman work at a site like Ephesus superimposed on the Hellenic. Even the Ephesian theatre is not as it was in the time of St. Paul. On the other hand, the Cretan explorations have brought to light nothing but old work of the earliest and most interesting kind. The expedition visited five separate sites, where excavations have revealed not only the remains of great palaces, as at Cnossos and Phaestos, but prehistoric towns, with their narrow paved streets, their small closely-packed houses, their flights of steps, their suburban burying-places. One such town has been excavated at Gournia, in Eastern Crete, by an American lady, Miss Boyd, who received the party and conducted them over the carefully explored site. Miss Boyd has made herself popular in the best sense among the people, and the whole undertaking has been carried out in the most exemplary fashion.

With regard to the civilisation represented by these so-called Mycenæan remains, we are still in the dark. A fact, most conspicuous at Phaestos, in Crete, but one of which there is evidence elsewhere also, is the existence of two distinct strata of monumental structures on the sites, representing two distinct types of palace. One type, which is still in appearance the earlier, is represented centrally at Mr. Arthur Evans's diggings at Cnossos, and shows us a number of comparatively small apartments grouped, with some attention to arrangement, about large open courts. The other type is best exhibited at Tiryns, in the Peloponnesus, and here we have a plan which seems to correspond with the descriptions in Homer, presenting us with one large hall opening by ample porches into a court flanked by colonnades, all the other rooms being of quite a subordinate order. At Phaestos the latter type, the Homeric palace, has been superinduced on an earlier house of the Cnossian type, and there is some evidence that the same was the case elsewhere. Dr. Dörpfeld calls the earlier type "Carian," and the later, or Homeric, type, "Achæan," but we know too little about the Carians for this distinction to help us. One thing is clear, that the builders of both kinds of palace were remarkably artistic people, and it is evident, too, that they had similar artistic tastes and social customs, for the well-known fresco of the bull from the "Achæan" palace at Tiryns is closely paralleled by the bull frescoes on the walls at "Carian" Cnossos. The "finds" from all the Cretan sites are collected now in a large room and gallery of the museum at Candia, and the exhibition is perhaps still more attractive than the Mycenæan room in the Central Museum at Athens. The decorative instinct, the love of nature, the exquisite precision of workmanship, of which there is evidence at Candia, make the collection one of the most fascinating interest. If the work be Greek, it is curiously unlike the genuine early Greek art of the historical period, from about 600 B.C. onward, in which there is far less spontaneity of artistic expression, and less of the genial naturalism which delight us in Cnossian frescoes and Mycenæan painted pottery. It is clear that the future must hold in store for us many fresh discoveries before the problem of pre-Homeric civilisation in Ægean lands is satisfactorily solved.

M. Scellier de Gisors, the architect, has died at Paris in his sixty-first year. He was an inspector-general of civil buildings, professor at the Ecole des Beaux-Arts, architect of the Luxembourg Palace, &c.

MANCHESTER SOCIETY OF ARCHITECTS.

ON Saturday, June 3, the members of the above Society visited Norbury Church, Derbyshire, a very interesting and unusual church. Originally there seems to have been a Norman nave, to which was added a fourteenth-century chancel, and on the south side a tower. Later, in Perpendicular times, the nave was rebuilt with a north aisle, and the spaces on each side of the tower were occupied by chapels; the latter are low, and the result is a charming bit of grouping both outside and inside. The glory of the building is its magnificent stained-glass, the colour of the fourteenth-century work in the north and south windows of the chancel being something to remember. The east window is rather a jumble of bits of fifteenth-century glass from the nave, good in themselves, but not forming one design. The red brick Marton House adjoining well deserves notice.

Wootton Lodge was next visited, by kind permission of Colonel B. C. P. Heywood, who entertained the members to luncheon, and devoted the afternoon to showing them round the house and its beautiful gardens. The house is an excellent example of a stately Elizabethan mansion. The entrance front is singularly fine; two low buildings, stables, &c., mark the angles of the enclosed forecourt, through which an elliptical drive leads to a great flight of steps rising to the main entrance porch. The porch is carried right up to the parapet, and is enriched with heraldic carving. On either side of this central projection are long windows four storeys high, with great mullion and tre-moine windows, while just visible round the corner on either flank are similarly lofty circular bays. The front is surrounded by a balustrade. From a slight hill in front of the house the dignified symmetry of this front and its forecourt is impressive, and one regrets the loss of the tree-shaded avenue which in former times led over this hill straight to the entrance gates. The gardens have terraces and broad flights of stone steps, and a most charming and unexpected little "front garden" on the top of a crag behind the house.

On Thursday evening, June 8, the Society visited the Manchester Arts and Crafts Museum, attached to the School of Art. Brief comments on the principal objects of an architectural character were made by Professor S. H. Capper and Mr. P. E. Corbett, and the head-master, Mr. R. Glazier, gave an account of some of the handicrafts represented in the museum, notably of glass and pottery.

TESSERÆ.

Place Names.

NAMES were not given in old times as they too often are given now, out of mere whim or caprice, without the slightest regard to their suitability, so that a row of little ugly brick cottages by a dusty roadside is yclept "Paradise Place," and a batch of tenements, whose only view is over a hideous brickfield, is known as "Prospect Terrace," and "Abbeys," and "Priories" and "Granges" are among the common stock of the builder's nomenclature. Anciently every local name had a meaning, and was given by those who knew that meaning and because of it. It is not always—perhaps not often—possible for us, at this distance of time and with the alteration and mutilation to which our local names have been subjected in the mouths of so many generations, to determine this meaning. It is often guesswork with the best equipped philologists. But difficult as the problem is, we are sure it has a solution, and this solution is well worth any amount of trouble to discover. As archæology is the handmaid of history, so is philology the handmaid of archæology. A well-directed study of words and names is one of the most important helps in arriving at the knowledge of things. No ancient place or name is without a signification, and in these names a store of history lies, crouched, waiting to be brought to light by the science of comparative philology. In the words of Professor Earle, "When the duly-trained philological eye traverses the map of any district, it can read at a glance the traces thereon left and assign each name to the race that gave it birth."

An Egyptian Funeral Tent.

One of the objects found in a tomb some years ago at Deir-el-Bahari was a canopy or tent which had been used at the funeral of Queen Isi-em-Kheb. The tent may be described as a mosaic of leatherwork, consisting of thousands of pieces of gazelle hide, stitched together with thread of colour to match. The edges are neatly bound with pink

cord of twisted leather, sewn on with stout pink thread; each colour is a separate piece, no one section bearing two colours; thus each square of the chessboard-patterned footstool, upon which the gazelles are kneeling, is a distinct morsel stitched to its neighbours. The whole work is, in fact, a mosaic, and is the only example yet discovered of what may be called ancient Egyptian tapestry. The colours consist of bright pink, deep golden yellow, pale primrose, bluish-green and pale blue. They were wonderfully well preserved, considering that they were laid on not long after the Trojan war, and are contemporary with Solomon. Much of the surface still retains a gloss similar to that of a kid glove; the pink, yellow and green have not faded at all, though dulled to some extent by the dust of ages. The canopy consists of a great central panel 9 feet long and 6 feet wide, divided into two equal sections. One is covered with pink and yellow rosettes on a blue ground; the other displays six vultures, each surmounted by a hieroglyphic text, and divided from its neighbour by a row of pink rosettes on a yellow ground. At each side is a flap divided from the central section by four bands of colours—blue, red, yellow and green, and further ornamented with a border of a spear-head pattern. Below this comes a row of panels containing various emblematical devices, and below that again is a chessboard pattern of pink and green squares, bordered at bottom with a broad belt of pink. At both ends are flaps presenting the same arrangement of chequers when spread out flat. The entire fabric measures 22 feet 6 inches in length and 19 feet 6 inches in width, and covers a space of 201 square feet of leather.

"Scottish" Building Trades Exhibition.

SIR,—As I am receiving letters asking whether I have any connection with a "Scottish" Building Trades Exhibition, which is being undertaken owing to "the encouragement given by the increasing success of the London enterprise," would you kindly allow me to state that I have no connection whatever with this venture nor has any of my staff.—Yours faithfully,

H. GREVILLE MONTGOMERY.

The International Building Trades Exhibition,
43 Essex Street, Strand, London, W.C.:

June 14, 1905.

GENERAL.

The Painters who will assist the Corporation of Liverpool in hanging pictures for the autumn exhibition are Mr. George Clausen, Mr. Herbert J. Draper and Mr. W. Follen Bishop, of the Liverpool Academy of Arts. The receiving days are August 14, 15 and 16, but works from the Royal Academy and other London exhibitions will be accepted up to the 19th.

The Usher Hall Committee at their meeting on Monday asked Mr. Morham, who prepared plans for a new building, to report whether the Synod Hall could not be reconstructed to serve all the purposes desired.

M. Romagnol has been elected wood-engraver for the Banque de France. His first work will be a hundred-franc note, for which M. Luc-Olivier Merson prepared the design.

A Competition, limited to Carlisle architects, for a new school which is to cost 12,000*l.* has been arranged. The premiums are 75*l.*, 30*l.* and 20*l.* Mr. Brierley, of York, is the assessor.

The Design of Mr. J. E. Franck for the Hammersmith baths and washhouses has been provisionally adopted, as it has yet to be ascertained whether the work can be carried out for 45,000*l.*

Mr. A. W. S. Cross has been appointed architect for the restoration of the Shoreditch town hall, which was subjected to fire in August 1904.

The Edinburgh Architectural Association discussed on Wednesday the arrangements for the proposed autumn exhibition of drawings and photographs of architectural "refinements," lent by the trustees of the Brooklyn Institute of Arts and Science.

Mr. E. M. Gibbs has submitted his report to the housing sub-committee of the Sheffield City Council with reference to a competition amongst local architects for plans for the erection of twenty dwelling-houses on the Corporation's estate at High Wincobank. It was a condition of the com-

petition that the houses could be let at 5*s.* per week without involving any charge on the rates, and each set of designs had to be accompanied by a builder's tender. Mr. Gibbs awarded the first prize to design No. 5, by Mr. H. L. Paterson and the second prize to design No. 16, by Mr. W. Spencer Smith. Twenty designs were submitted for competition.

Mr. James A. Morris, architect, has declined to assist the town surveyor of Ayr in the rebuilding of the old bridge under conditions laid down by the works committee of the Council. The town clerk was instructed to inform Mr. Morris that they would be glad to avail themselves of his assistance in a friendly way if required.

M. Zo has obtained the "Prix National" of the Salon. Travelling studentships in architecture were awarded to MM. Despegroue and Coutan.

Mr. William H. Alexander, B.A., of Weymouth, barrister-at-law, the donor of the buildings for, and a trustee of, the National Portrait Gallery, and who died on April 28, has bequeathed to the National Portrait Gallery the portrait by Vandyke of John Thurloe, and to the National Gallery the portrait (which came from Blenheim) of a woman, by Hendhorst.

The Edinburgh Museum of Science and Art has now on exhibition the collection of arms and armour and other objects of historic and national interest gathered together by the late Sir Noel Paton in his house and studio in George Square. The collection, which numbers over 800 specimens, fills the east corridor and nearly the whole of the adjoining hall. It has been purchased as a national property at a cost of 10,000*l.*

The British Architectural Association will hold their sixty-second annual congress at Reading on July 17 to 22. The president of the congress will be the mayor of Reading Mr. M. J. Sutton. The inaugural address on the evening of the 17th will be delivered by Mr. C. E. Keyser, F.S.A., the president of the Berks Archaeological Society. Excursion will be made on the 18th to Silchester, Pamber, Padworth and Upton Court; on the 19th to Lambourn, Ashdown Wayland, Smith's Cave, Uffington, the White Horse, Spars Holt and Wantage; on the 20th to Wallingford; on the 21st to Abingdon; and on the 22nd to Newbury.

The Resolution of the Corporation of Glasgow, following on a plébiscite of the ratepayers in favour of the Sunday opening of art galleries and museums belonging to the city, came into operation on the 11th inst. The hours fixed for opening were between two and six in the afternoon. The weather was exceptionally favourable, and as a result the total attendance at the three institutions was 14,102, as compared with a daily average of about 5,000.

The Shah of Persia, being a sovereign prince, need not pay his debts, and if tradesmen give him credit they do so entirely at their own risk. This has been established by a French Court in deciding in favour of the Shah in an action brought by an architect who wanted to distrain on the Persian monarch's personal property during his coming visit to France.

A Competition is being organised for the erection of a County Court House in Chicago, U.S.A. Seven firms have been invited to compete, and they have been guaranteed 1,000 dollars to cover expenses. Any other architect may compete under certain conditions. The first, second and third prizes in the competition for design and plan are respectively 5,000 dollars, 2,500 dollars and 1,000 dollars. The cost of the building, exclusive of furnishings, is to be 3,500,000 dollars. The successful competing architect will receive 5 per cent. on the first million of the cost, 4 on the second million and 3 per cent. on the remainder.

A Chancel Screen has been dedicated at Ilsham parish church, Torquay, having been erected at the cost of Mrs. Snelgrove to the memory of her late husband, Mr. John Snelgrove, of St. Elmo, Torquay. The screen, which is constructed entirely of English oak, was designed by Mr. Charles Forster Hayward, F.S.A., of 50 Great Russell Street, W.C., and was carried out to the drawings and under the superintendence of Messrs. Hayward & Maynard, architects, 20 John Street, Adelphi.

The Mayor of Exeter has laid the foundation-stone of the new institute for the parish of St. David's. Mr. Harbottle Reed is the architect and Messrs. Ham & Passmore the contractors.

Messrs. Kerr & Watson, architects, of Johnstone, N.B., are engaged in preparing plans for a public school in that town to accommodate 800 scholars.

The Architect.

THE WEEK.

FOR over thirty years the late JAMES MANSEERGH was one of the foremost of English civil engineers. His works were mainly connected with water supply and sewerage, but originally he acted as a railway engineer. He was a native of Lancaster, where he was born in 1834, and he was among the early pupils of Queenwood College, where JOHN TYNDALL and EDWARD FRANKLAND were among the professors. It was an experimental school established to train youths in practical science, and there is no doubt it was a success. The influence of TYNDALL made him desirous to become an engineer, and he entered the offices of Messrs. McKIE & LAWSON, Lancaster. There were various opportunities to be initiated into a varied practice, and in his twenty-first year he was able to obtain an engagement as a contractor's engineer of a railway in Brazil. On his return in 1859 he again aided Mr. McKIE. In 1866 he joined the staff of Mr. LAWSON, and on the death of the latter in 1873 he continued the practice. More attention was then given to water supply and drainage than in former years, and it is calculated that Mr. MANSEERGH was engaged as chief engineer for the waterworks in over sixty towns. His services were not confined to this country, for his advice was sought for projects in various parts of the world. In 1900 he attained the coveted position of President of the Institution of Civil Engineers. His latest work on a grand scale was the Birmingham water supply, for which in 1892 he prepared the plans. Hitherto it has been a success. His life must be considered as exceptionally fortunate. He made his way entirely by his own abilities, and he had the satisfaction of knowing that his business would be carried on by his sons. It is believed, however, that he did not escape from the dissatisfaction which generally accompanies success, for he believed that he lost his vocation when he undertook to design and superintend works instead of contracting for them.

AN interesting point to architects has been raised in connection with the contracts for the new Art Galleries in Glasgow. It was desired to erect the buildings with expedition in order that they might be used for the purposes of the last great exhibition in the city. The contractor died, and in such an emergency it was reasonable to presume there would be a delay in continuing the work. The Corporation, therefore, offered a bonus of 5,000*l.* provided the work was done by the time originally stipulated. The architect, Mr. JOHN SIMPSON, claimed 5 per cent. on the bonus, but the claim was disallowed on the ground that the 5,000*l.* should be considered as given for a special purpose, and was not part of the cost. There is no doubt it was part of the outlay on the exhibition buildings. By the general rule the architect is to be paid his percentage on the total cost of the works which were carried out from his drawings. The Corporation have called the sum they paid a bonus, but that does not alter its character, for it was only a rough-and-ready way of giving a higher price for work than that which appeared in schedules or measurements. Seemingly because the buildings cost 200,000*l.* and the architect received 5 per cent. on that amount, the Corporation contended he ought to be satisfied. But that sort of arguing would not be listened to in any of the Scottish Courts. If the Corporation agreed to pay 5 per cent. on the total cost their liability is not diminished one jot by calling a part of that cost a bonus. We suppose the arrangement for paying the contractor the increased sum was made through the agency of the architect. If so that is further evidence of their liability.

ALTHOUGH there is a possibility of preserving the French churches by making the congregations responsible for their conservation, that kind of security is not available for the monasteries and convents. At the first Revolution buildings of that class were devoted to secular uses. Many of them lost the most interesting of their characteristics, and French archæologists, although they may not approve of the monastic system, regret the destruction of works of art which cannot be replaced. The treatment to which the Palace of the Popes at Avignon was and is subjected suggests the fate of buildings which are less renowned or may have little historical importance. The French Government, it must be said to their credit, are desirous to diminish if they cannot prevent the vandalism which seems to be inevitable. The Minister of Public Instruction and the Under-Secretary of the Ministry of Fine Arts have taken a courageous initiative by endeavouring to protect the Grande Chartreuse. From its position in Dauphiné, at a height of over 4,000 feet, it could easily be made to suffer. But, in spite of all that was done at the time of the Revolution, it contains much which has architectural importance, and especially the cloisters. What has been achieved is to induce the Commission of Historic Monuments to enter the Grande Chartreuse in the register of buildings of which they have charge. This has been done, and the precedent may be adopted for taking charge of other ecclesiastical buildings.

A FIRE broke out recently in the cathedral of Fulda, which fortunately was stopped after the upper part of one of the towers had been destroyed, including the belfry. The bell, it is feared, has suffered beyond restoration. It dates from 1415, but was recast in 1648, and the people of Fulda considered it was superior in tone to all the others in Germany. Fulda is not a very large town, and it is believed the administration was at fault or the fire might have been subdued at an earlier hour. The building has interest for Englishmen, for it stands on the site of the Benedictine Abbey which was founded in the eighth century by St. BONIFACE, the apostle of Germany, but who was a native of Devonshire. It was not until the eighteenth century that the abbey became a cathedral. The building which was so lately in danger was erected at a time when the modern Italian style was preferred to German, Gothic or Romanesque. The crypt, however, is a survival of the abbey church.

THE progress of the explorations by the German Archæological Institute at Pergamon has been described in a communication to that body. An antique building, but of what kind is uncertain, has been discovered between the second agora and the gymnasium. Apparently it was a residence for some wealthy patrician, and as such it has unusual interest. The *Hermes*, after ALCAMENES, stood in one of the halls; there was also a second figure of HERMES, of which a part remains and which evidently was produced at the cost of a Roman consul. Several large fragments of mosaic have also been brought to light. The larger gymnasium occupied the party for some time. It must have been an impressive building with halls containing many columns. Originally the latter were in the Doric style, but the Romans substituted Corinthian columns in some cases. Judging by the number of the fragments there was an abundance of sculpture. The inscriptions are still legible. One records the services of a superintendent to whom almost Divine honours were paid. It is anticipated that when the exploration is complete the gymnasium will be one of the greatest victories of the German Institute over time. The theatre revealed peculiarities of arrangement which were unexpected. In the neighbourhood of Pergamon there are also many sites which could be turned to account, but at present the city itself is more than sufficient to engross the attention of the exploring party.

WOOD-CARVING.

LORD AVEBURY acted as became a naturalist when on Monday he delivered a discourse at Carpenters' Hall to the students of wood-carving about the greatness of wood. That material introduces in our houses something of spring, summer and autumn. It was, as he said, mysteriously built up from the air of Heaven, and was watered through the agency of the exquisite machinery of the leafage. It conveyed, too, a moral lesson by suggesting the shortness of human life, for while few men expect to live a century, a tree could enjoy existence for more than a thousand years. Unfortunately mankind in general are not disposed to reflect on the blessings which Heaven has bestowed upon them. People who live in timber houses are as oblivious of the origin of the beams and quartering as if they occupied houses with walls of artificial stone. Indeed, of late years wood has been shrouded with paint to such an extent that it is only by inference we realise what it is. If paint is not used, varnish and stains are employed, so that the original appearance of the tree when it was first cut is no longer presented. Women, as a rule, are inimical to plain wood; they prefer to see it painted. Sometimes a compromise of the man's and the woman's ideas is obtained by varnishing the outsides of doors and painting the inside.

It is well to have arrangements made for the study of wood-carving. It is not, however, a new art, as some members of the Carpenters' Company suppose. For in England, as in all northern countries where timber abounds, the natural instinct of man compelled him to try and impart an ornamental appearance to the wood he used. It was much easier to carve than stone, and there was always a liability to over-charge it with ornament. Enough remains of the work of the Mediæval carpenters to suggest their competency as well as their extravagance. It is, however, in the work of the early Renaissance that we can see the prevalence of the skill which was to be found in England. The timbering of the exteriors was sometimes wrought into fantastic forms. But it was within doors the carvers were allowed to revel. They were not always inventive in the creation of patterns. Nevertheless, if they employed stock forms, they were prodigal in the use of them. The advantage of blank spaces in giving effect was neglected, and we may see Elizabethan work which is as covered with carved forms as a piece of room paper with a printed pattern. In buildings which are known to have been designed by architects we find more restraint; but the English carver of the Renaissance period loved profusion, and if contracts were not illiberal his modern successor would gladly imitate him.

Whether it was recognition of a principle or inability to imitate natural models cannot now be decided, but the greater part of the ornament introduced in those days was of a conventional character. However, under the STUARTS fruit, flowers and birds were more often imitated. Carvers like GRINLING GIBBONS believed themselves independent artists, and all classes seem to have been smitten by their imitations. Although something about art has been taught in schools, it must be sorrowfully admitted that English people in our time are no less susceptible to the carver's skill in imitating natural products. In a building like St. Paul's, happily, the work of GIBBONS is not easily recognised; it is lost among other details. It is only in a mansion where he was allowed full sway that we can judge of the taste of the spectators. In Petworth the whole of the Greek marbles are not considered to be equal to the pears, apples or cherries or the birds which GIBBONS and RITSON were allowed to execute. If the end of art is to give pleasure there can be no doubt the carvings have attained that end, but they could not have been set up under the direction of any architect acquainted with the principles of his art.

Carving can be utilised in such a way as to become

an aid to architecture. Italians and Frenchmen have carved figures and ornament during centuries which are still delightful to look upon. But those artists were able to recognise their true position and that they were only auxiliaries in the production of a kind of art which was comprehensive in its character. English independence, apparently, does not allow of that kind of co-operation. Give a wall-painter or a plumber, a stained-glass designer or a sculptor an inch, and he is sure to take an ell. He will endeavour to make it appear that his particular work is the most important of all, and he consequently endeavours to have attention drawn to it, regardless of all other considerations.

The condition of things has so changed that there is only opportunity to use carving to a limited extent in a modern house. In the council chambers of municipal buildings and special rooms in public offices it may be feasible to have panelling with some ornamental carving covering the walls, but in houses, whether large or small, there are difficulties, for panelling and carving have been superseded by other modes of decoration. When tapestries first came into vogue panelling became unnecessary. At a subsequent period painting claimed possession of the walls. In some old English mansions it is possible to see paintings which are hung upon panelling, but as the lines of the latter rarely correspond with the frames of the picture, the panelling is concealed and the painting suffers. When it is possible to assign a certain number of portraits to a room panelling could be arranged to accommodate them, but cases of that kind are comparatively few. People who possess pictures like to be able to change their positions or to introduce others in their places without detriment to the appearance of the apartment.

The Gothic Revival must be credited with the increased esteem which was given to woodwork, whether plain or adorned. The principle of honestly displaying materials and workmanship brought about a great improvement in carpentry and joinery. As churches were the foremost fields for Gothic art it became necessary to employ carving as well as substantial woodwork. The demand for carving incited invention, and the clergy sometimes found joy in stalls which were mainly the product of machines. It was discovered that the style lent itself to that mode of execution. But we are now living in a different period. Forms which then were admired because they were supposed to be archaic would not now be tolerated. Old English houses may be erected, but any carved ornament introduced must be of more refined form than was displayed by the originals. Woodwork may vie with Scandinavian examples on account of its massiveness. Yet the simplest incised ornament must have a grace such as was unknown to the Vikings. If we still show alliance with northern art it has also to appear that we are under Italian and French influence, and that the Renaissance spirit is stronger now than at the end of the sixteenth century. Carving can only be sparingly employed, but it has to be of a very high class.

At the present time a sculptor who could work in marble and bronze would hesitate before producing a panel in wood. If he made the experiment he would find he could not gain a place for it in an Academy Exhibition. Seeing that wood-carving must be restricted in the extent of its employment, and that carvers can never receive the prices which are given for other classes of artistic work, the question ought to be raised whether it is the employment which should be encouraged among ordinary students. It is the sort of work which could well be combined with joinery. At least, the kind which is most in request need not be produced by a specialist. Anyone, however, who would look at the programme of a technical institution in town or country will see that wood-carving is set down as one of the most prominent items, although a little inquiry would show that even competent men can only expect precarious employment.

CHESTER ARCHÆOLOGICAL SOCIETY.

THERE is hope for the study of antiquity in England so long as there are such societies as that which represents the county and city of Chester and North Wales. The time seems to have vanished for making broad generalisations. Our capacities are only limited, and fortune has favoured us by originating a belief in specialists. The archæology of Great Britain is too vast a science to be grasped by an individual, and for the majority of men there is often more than enough for a single person to comprehend in the survivals of his own parish. The example which GILBERT WHITE displayed to his countrymen in the district of Sherborne should be more frequently followed by archæologists. What is nearest to us, says Dr. JOHNSON, appeals to us most strongly, and it is fortunate that in Great Britain few places exist in which the imagination cannot find work to do in restoring the past. Chester, no doubt, is especially well favoured, for its history goes back to an ancient date, and many times it was the scene of important events. But in archæology the distinction between great and little should be disregarded, for objects which at first sight may appear to be of no value may eventually be discovered to be as useful as the fragments of bones which CUVIER and OWEN employed to recreate beings which had vanished.

The first paper in the Journal for 1904-5 is by the Archdeacon of CHESTER, and relates to the churchwardens' accounts of the parish of St. Bridget, Chester, 1811-47. The beginning of the nineteenth century may be considered as hardly coming within the province of archæology. But owing to defective memories and indifference a still nearer date seems as remote as the time of the PHARAOHS. Brief as is the period, it is remarkable that the church was removed from Bridge Street, and another erected in Castle Esplanade, which has also vanished. Chester is without a church to St. Bridget, although we may assume from the dedication to the saint that one must have been standing for many centuries. The cause of the removal was that it stood in the way of the approaches to a proposed bridge. The new parish church was commenced in 1829, WILLIAM COLE, jun., being the architect. It was consecrated in 1829. The people could not have been annoyed at the removal, or the churchwardens were very forgiving. THOMAS HARRISON, who designed the new bridge, died in April 1829, and was buried in St. Bridget's churchyard. A sum of 15*l.* was paid for the grave, which was returned to the executors "as a testimonial of the great estimation in which that gentleman's abilities were held by the rector and parishioners of St. Bridget's." The bridge, with its arch of 200 feet span, was regarded as a marvel in those days. HARRISON was an architect who erected several important buildings in England, and he suggested to Lord ELGIN the advisability of obtaining casts of the marbles of the Parthenon. The county authorities were more generous to architects at the beginning of the nineteenth century than they are at present, for the house in which HARRISON died had been presented to him as a recognition of his services. It is now the vicarage of the united parishes of St. Bridget and St. Martin. What the new St. Bridget's Church was like cannot be ascertained, for there was no drawing made of it.

The people of Cheshire, and of Great Britain also, have reason to be proud of the 22nd Regiment of Foot. It was the first regiment raised to uphold the principles of the revolution on the accession of WILLIAM and MARY, and its creator was the Duke of NORFOLK, who might be expected to be in favour of the old régime. The earliest active experience of the regiment was in Ireland, and it fought at the Boyne, Athlone and at Aughrim. In India, under Sir CHARLES NAPIER, the regiment further distinguished itself, and there are memorials of its services in Chester Cathedral.

Mr. W. E. B. WHITTAKER has a paper on "Peculiars," with special reference to the "Peculiar of Hawarden."

"Peculiars" are parishes which are exempt from the bishop's jurisdiction. Several of them were at one time connected with monasteries, or obtained the privilege from the Pope. Hawarden until 1257 belonged to the Abbey of St. Werburgh, Chester. About that date the Baron DE MONTALT obtained this independence in exchange for certain lands. Hawarden was particularly careful to avoid indebtedness to Chester. If the services of a bishop were needed, some Irish bishop who was on his travels was called in. There is nothing in the history of the parish to show that the people of Hawarden were the gainers because they differed from ordinary parishioners. Mr. WHITTAKER, however, says:—"Though a 'peculiar' might be out of place at the present time, we must not make the mistake of thinking that they were merely abuses of prerogative on the part of the Popes and others. In those days of large dioceses and imperfect communication, it must have been rather an advantage than otherwise for a bishop to have several large parishes cut off in this way. The proving of wills locally, though it fostered abuse, was still a convenience to the poorer classes."

"Horns" being treated by Dr. BRIDGE, it might be supposed at first that one important class of musical instruments was described. On this occasion Dr. BRIDGE regards the horn as the symbol of legal authority. In this country prior to the Norman invasion, when it was not convenient to have deeds drawn up by a lawyer and inscribed on vellum, a horn took the place of a conveyance and was recognised just as copyholds are at the present time, although there is nothing to show but an entry in the manorial register. The subject might be thought to be outside Dr. BRIDGE's province, but he has investigated it with a fulness that would do credit to a Chancery lawyer of the old school. The Pusey Horn is one of the best known in England, and it was given by King CANUTE to WILLIAM PUSEY with a manor as a reward for acquiring information about a contemplated ambushade of the Saxons. Sir HENRY AUBREY FLETCHER owns the Borstal Horn, which was a gift from EDWARD THE CONFESSOR. The Hungerford Horn confers the right of fishing and shooting on those inhabitants of the town who possess common rights. In Cheshire there are several horns. In York Minster is a Charter Horn. ULPHUS, it is recorded, "went to York, and, taking the horn wherein he was wont to drink with him, he filled it with wine, and kneeling upon his knees before the altar, bestowed upon God and the blessed St. PETER all his lands and tenements." FRANK BUCKLAND said that the horn reminded him of the tusks of the mammoth found in Siberia. Figures on tombs of knights are sometimes represented as grasping a horn. One in Pershore Abbey is believed to be WILLIAM DE HARLEY, who fought in the First Crusade, and by having the horn in his right hand it is concluded he held his lands by cornage or horn-geld.

The concluding paper, illustrated by several views, was prepared by Mr. EDWARD HODKINSON, the honorary secretary to the Society, and is called "Notes on the Architecture of Basingwerk Abbey, Flintshire." It was a small Cistercian house, but the characteristics of the style of the Order were as much recognised as in a larger building. The forms were severe, yet refined. Mr. HODKINSON describes its present condition by saying:—"Of the state of the ruins of the once beautiful abbey of Basingwerk it is painful and useless to speak. Our Society, and many of our members individually, have done everything possible to raise up some enthusiasm for their care in their immediate neighbourhood and elsewhere, but, unfortunately, without avail. Not many years must now elapse before every vestige of this once important house (save perhaps the remains of the refectory) will have disappeared." Among the most interesting parts are some half-timbered buildings which were used for storage, guests and other purposes. Some parts of the structures were removed for the benefit of other churches. Mr. HODKINSON's paper with

its illustrations should be sufficiently persuasive to those possessing wealth for a combined effort to preserve so admirable an example of Mediæval work.

BUILDING MATERIALS.*

ALTHOUGH building can be regarded as one of the most important of the national industries, it is remarkable that we have not yet a museum containing a representative collection of materials and appliances. In the Geological Museum we can see some building stones; where, however, there is so much else relating to minerals in general it is difficult to concentrate attention upon them. The woods at Kew lose their interest for a similar reason. At South Kensington, in one of the dreary galleries, there used to be odds and ends relating to building, yet few of them were worthy of a builder's attention. The Parkes Museum shows some excellent sanitary appliances, but wisely the character of the collection has been restricted. There is no museum in any other town where a young student could go with a book like Mr. MIDDLETON's in his hand in order to test the accuracy of the descriptions, and to gain that knowledge which is only to be derived by the aid of the eyes.

One of the reasons for the absence of a building museum is that the scientific aspects of materials were not always considered. This we can see from the commission which was appointed to discover stone to be used for the construction of the Houses of Parliament. DE LA BECHE and the two SMITHS possessed experience as geologists. The question at stake, however, was what stone would resist the London atmosphere, not what stone would support an ordinary load. Now that was a problem of chemistry, and in those days the connection of geology with chemistry was not recognised. Consequently no chemist was employed to test the stones, and we all know what followed. Some years afterwards, when the Geological Survey was established, one of its chiefs was BEETE JUKES. He had made surveys of a large part of the globe. He was an enthusiast for his science, and he was among the earliest to perceive that a knowledge of chemistry was essential for a geologist. He therefore studied that subject and imagined that he had succeeded sufficiently to write the chapter on chemistry and mineralogy, which was to be the first in a treatise he had undertaken to prepare. He submitted his manuscript to a chemist, who, he said, "pointed out to me many errors into which I had fallen, not so entirely from any fault of my own as from the absence of precise information on certain points, and the presence of certain anomalies in the use of terms which characterise every elementary book." At the time the sole work worth consideration was GMELIN's "Handbook," but it was only obtainable by members of the Cavendish Society.

We do not wish to exaggerate the advantages of science. The Mediæval builders knew little about either chemistry or geology, and yet they succeeded in combining stones in ways that were hazardous. But if materials are to be studied under the microscope and tested by the aid of chemistry and special machinery, then the science which should be applied must not be partial. A little knowledge is often dangerous, and it is quite possible that excellent materials will be rejected which would serve under all conditions of ordinary practice.

When Mr. MIDDLETON confesses, "I have learned a great deal during the preparation of this book, and

all that I have learnt I have endeavoured to express therein for the benefit of others; but fresh knowledge comes to me almost every day," he merely expresses the surprise of all honest students when they endeavour to thoroughly understand the mysteries of materials. In specifications much which may be stereotyped is adopted, and qualities and conditions are prescribed with the confidence which was originally derived from the specifications copied in the early days of pupillage. Mr. MIDDLETON has not compiled his book from other treatises, for wherever possible, he says, he travelled in order to see things for himself. No doubt similar information is to be obtained elsewhere, but all through the pages we see an endeavour to express only facts as far as they were realised by the author.

There are forty-five chapters in the book. A great many of them contain numerous facts arranged in tabular form, while others have summaries, "notes for users" containing deductions from what has been stated. The author begins with the mineral kingdom, describing different varieties of stones, cements, limes, bricks, &c. Next timber is treated, and afterwards the metals used in construction. Then we have chapters on paints, varnishes, glass, papers, asbestos, uralite, slagwood, ruberoid, &c. It is difficult amidst such a mass of information to take any extract, for all the paragraphs are united. The following, however, relating to sand will help to suggest the condensation of the descriptions:—

It is well to bear in mind (1) that the individual grains of sand contain no salt; (2) that the salt merely coats the grains or lies between them, having been deposited there by the evaporation of salt water; (3) that the salt is soluble in water, and may be entirely removed by careful washing; and (4) sea sand so washed is quite as good for building as any pit or river sand of equal fineness and smoothness of grain. Other methods of "killing" or neutralising the effect of the salt in sea water have been tried at various times, but they have hardly proved successful. Salt is the most harmful substance which sand can contain. It has so great an affinity for moisture that a wall in which it is used is rendered permanently damp. Any sand which is salt to the taste, including all sea sand and a good deal of pit sand, dug from comparatively recent under-sea deposits, should consequently be rejected for all purposes other than for use under water, unless it be first properly washed. Sea sand is also generally rounded by attrition, and consequently wanting in sharpness; and so to a less extent is river sand. Pit sand is of all qualities, it being impossible to lay down any rule. An excellent sand is obtained in the process of washing decomposed granite for the extraction of kaolin, but it is only used locally, the cost of transport being prohibitive. Sand does not absorb water in any appreciable quantity, its bulk is not diminished or increased by cold or heat, and does not contract in drying; therefore the greater the quantity of sand used in mortar in proportion to lime the less probability there will be of the mortar shrinking and breaking.

Mr. MIDDLETON's book meets a necessity of which most architectural students must have had experience. It should always be kept at hand for reference, for the information in it will be found adapted to all classes of buildings.

Mr. RICHEY, who has prepared Messrs. WILEY's handbook, is a representative American, for he has had experience as carpenter, contractor, architect and superintendent of construction. His handbook is of wide scope, in order to be useful to those who are prepared to utilise all opportunities of advancement which may come before them. There is therefore information not only on ordinary building, but on drawing, mensuration, hydraulics, &c. American pocket-books are well known from their encyclopædic contents, and Mr. RICHEY's can take a place among them. It would be interesting for anyone who wishes to understand American building to compare the pages with those in similar English guides. The author gives ample extracts from the latest building codes of various American cities, and we can therefore realise the

* *Building Materials, their Nature, Properties and Manufacture*: a Text-book for Students and others. By G. A. T. Middleton. Illustrated with 197 diagrams and twelve plates from photographs. (London: B. T. Batsford.)

A Handbook for Superintendents of Construction, Architects, Builders and Building Inspectors. By H. G. Richey. 357 figures. (New York: John Wiley. London: Chapman & Hall.)

standards which are sought after. A large part is occupied with fireproof construction, and more attention is given to heating than is usual in England. The valuable specifications which are introduced are all official, and the book may be taken as representative of American work under favourable conditions.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. John Belcher, A.R.A., president, in the chair.

Royal Gold Medal.

The PRESIDENT in his address said:—It is my good fortune this evening to conclude my year of office in a way that affords me an especial pleasure. Surely no president can desire anything better than as his last official act in the session to be called upon to confer high honour upon an esteemed friend and colleague. The Royal gold medal which I am here to present to Sir Aston Webb is a distinction conferred by His Majesty the King on the unanimous recommendation of Sir Aston's brother architects. For me to point out how this great honour has been won, and how richly it is deserved, might well seem superfluous if not impertinent; for there is no man better known or more highly esteemed in the profession than Sir Aston Webb—and probably nobody who has achieved a greater general popularity. Yet there are a few things I should like to say, and no doubt, too, a few things on which you will naturally expect me to give you some information. I am not going to give you a biography of our friend here, though it does seem the fashion nowadays to write (and even publish) an account of a man's life long before he has passed over to the majority. Dr. Johnson is said to have remarked that if he really thought Boswell was making notes of his life with a view to publication, he would take his (Boswell's) life first. The Doctor was a distinctly truculent old fellow, and Boswell might well have been afraid to avow his sinister design. But I have had many an experience of Sir Aston Webb's geniality and kind-heartedness, and am therefore prepared to say a few things about him, even though he be still, as I am glad to say, very much alive.

Firstly, let me point out how closely, from the commencement of his career, our former President has identified himself with his profession, and how readily he has lent all his energies and abilities to serve the true interests of his brother architects. The very year after he was articulated to Mr. Banks (of Banks & Barry)—that is, some thirty-eight years ago—he became a member of the Architectural Association, and from that time onward continued to serve the Association in one capacity or another, until finally, in 1884, he was elected its President.

Similarly with our own Institute. In 1874—that is, the year after he won the Pugin studentship—he joined us as an Associate, was elected a Fellow in 1883, served as member of Council, hon. secretary and vice-president, and finally became our President in 1902, bringing to the chair a wealth of experience and ability which won the admiration of all. Neither increasing honour nor the burden of works growing every year, both in number and importance, was allowed to interfere for a moment with his duty to the profession generally or with his kindly consideration for his fellows. In the advancement of his own fortunes he has never permitted himself to forget others; he never misses an opportunity of furthering the interests of those who are still painfully climbing the ladder. We usually allow our Presidents, when once they have passed the chair, to slip back into a sort of background of semi-obscurity, and thus practically, though not intentionally, limit their opportunities of service. This course has the advantage of making such demands upon new and rising talent as to provoke it to give of its best in the cause of the Institute; but I cannot help thinking that it is a pity we have not some sort of "Upper Chamber," not as a kind of *otium cum dignitate* refuge for men who have done their work, but as a standing committee in all matters of the highest importance, matters, viz. which call for the judgment and experience of years rather than the energy and impetuosity of youth. Fortunately for this Institute, Sir Aston Webb has not ceased to take a practical and working interest in its welfare. He remains, as you know, chairman of the Board of Architectural Education—a most important movement initiated during the term of his presidency, and fraught, I feel sure, with

very great and valuable results. Outside the Institute the list of his activities and responsibilities is a long one. He is the representative of architecture at the London University, and holds, as it were, a "watching brief" in its interest at the Royal Academy, to which he was elected an Associate in 1899 and Academician four years later. He supervises the work in the architectural school there, and many can testify with what ready sympathy and encouragement he meets all who come to him for help and advice. He is a trustee of Sir John Soane's Museum, also of the Architectural Benevolent Society and of the Artists' General Benevolent Institution. There are many other ways, too, as many know well, in which less publicly, but not a whit less truly, he is found serving the cause of art.

Now let me turn to speak of some of Sir Aston Webb's works—those monuments by which he is already generally known, and by which in time to come he will be famous. His peculiar distinction—and I might say peculiar good fortune too—lies in the large number of important public buildings that have been entrusted to him. Many of these have been won by sheer weight of merit shown in competition. Amongst such are to be included the Victoria Courts at Birmingham, the Metropolitan Life Assurance Society's Offices in Moorgate Street, and the Christ's Hospital Schools at Horsham, all carried out in partnership with Mr. Ingress Bell. The first named, the Courts at Birmingham, have served as a model for many similar buildings since. Our present interest, however, centres in the great works committed to him in London, viz. the completion of the Victoria and Albert Museum and the National Monument to Queen Victoria, both of them won in competition; also the Royal College of Science, opposite the Imperial Institute, and additions to the Admiralty Buildings at the east end of the Mall, both of which he received by direct commission. When not long ago I visited the new buildings of the Victoria and Albert Museum I conceived a great admiration for the arrangement of them. The planning is simple and readable; there are long vistas, and a great central octagonal hall; moreover, all the galleries are of noble proportion. The whole of the interior is to be treated as a background for the exhibits, with little decoration, and depending upon good form and colour. The staircases and galleries are so arranged as to afford glimpses from different levels of the larger objects on view. The external effects can hardly as yet be realised, but I know that the sculptor's art is to be called in to aid in setting forth the nature and purpose of the building. As is so often the case with our public buildings, there is no central approach; but in the present instance it would appear possible to open up the Square opposite, so that there might be at least an open space from which to view the museum, and where carriages might stand out of the way of the ordinary traffic. By this means not only would an important centre be more or less adequately indicated, but the great central entrance itself would receive a marked accession of dignity. If we want to appreciate to the full the advantage of a fine approach to a great public building, we have only to note the result of Sir Aston Webb's treatment of the Mall in connection with the National Monument to Queen Victoria. Indeed, after viewing the Mall now, we are compelled to admit that the present front of Buckingham Palace, to which it leads, is unworthy of it. As regards the rest of the scheme, the work is not yet sufficiently advanced for criticism. We still wait for the colonnades which are intended to enshrine the monument, but eventually, when Mr. Brock's great work is in its place, these columns will stand in rank almost like architectural grenadiers in attendance on Her Majesty. A very important, interesting and ingenious part of the scheme is on view in the Architectural Room of the Royal Academy. The entrance to the Mall from Charing Cross is marked by a building with curved frontages, one to the Mall the other to Charing Cross, so that the change in the line of access at this point will not be so noticeable. The entrance to the Mall will be through arches. Within the last week the keeper's lodge has been completed, and its position, centrally facing Buckingham Palace Road, is seen to be most effective.

These examples are among the happy results of Sir Aston Webb's competitive efforts; but for the consolation and encouragement of less fortunate men, with whom I have every sympathy, I may say that he has not always been so successful in competition—as, for instance, in the cases of the Admiralty, the War Office buildings, the Imperial Institute and the Freemasons' schools at Bushey. But when he has scored a win he has taken such a full advantage of his opportunity, and achieved such good results,

that he has received many direct commissions which were in themselves a flattering testimonial to his ability. The Admiralty entrusted to him the new Britannia Royal Naval College at Dartmouth. In conjunction with Mr. T. M. Deane he will build the College of Science Government offices in Dublin. He and Mr. Bell together are responsible for the Royal United Service Institution adjoining the Banqueting House, Whitehall, the new University of Birmingham now in course of erection, and for certain additions to Caius College, Cambridge.

Then, too, he has done a good deal in the way of churches, both restoring and building. The most important and most interesting of all these is the restoration of St. Bartholomew the Great in Smithfield between the years 1880 and 1890. He has restored three churches in Worcester, Burford Church, Herefordshire, and Witley in Surrey. He has built St. George's, Worcester; the French Protestant church and schools in Soho, and churches in North Wales.

Then there are various domestic works: mansions for Sir Offley Wakeman, near Shrewsbury; Sir Augustus Webster, at Hildon, Hants; and many others. The flour mills and granaries for Messrs. Mumford are amongst his most successful buildings in this kind. Altogether it makes a long list—an appallingly long list, we might say—when we consider the vastness of some of the undertakings. Such as it is, it shows what rare ability and power of work Sir Aston Webb is endowed with. Few men could accomplish all that he has accomplished. He is not an artist only, but an excellent man of affairs also, and possesses a tact and readiness of resource which is given to but few. His character shows itself in his work. The intellectual versatility and refinement, the brightness and felicity of temperament which we recognise in the man, all reproduce themselves in the examples of his art. Above all, by his sincerity and straightforward dealing he has won the confidence and esteem of all who have come into contact with him. It was his distinctive and characteristic work and personality which won for him the honour of knighthood in November last—an event which gave the greatest satisfaction to his friends and brother-artists. What more shall I say? Tennyson tells us that when the little *Revenge* was taken the stately Spanish men praised Sir Richard Greville "to his face with their courtly foreign grace." But it takes a Spanish Don to do that; besides, Sir Richard was very badly wounded. I think I have said as much as our national reserve will allow, enough to convince Sir Aston Webb of our high appreciation both of himself and his work, and in particular of his generous, self-denying labours in connection with the Institute.

In making the presentation, the President said:—I have much pleasure, Sir Aston Webb, in investing you with the Royal gold medal, and in assuring you of the high regard in which you are held by the whole of the profession.

Sir L. ALMA-TADEMA, R.A., said as a member of the Royal Academy he felt that in the name of their Institution he had a right to stand up and express to Sir Aston Webb the great pleasure it gave them when one of their number was so worthily recognised in his talent and in his endeavours to serve the great art of which he was such a distinguished representative. After what their President had said little remained to be told. While on his way to the Institute a friend had remarked that in conferring the gold medal, the last honour had been paid to Sir Aston Webb. What could they give next? He would repeat the reply he had given—the continuation of that respect for the artist and for the man, and that brotherly love of his friends, his co-architects.

Mr. ALFRED EAST, A.R.A., thought they could cordially congratulate Sir Aston Webb on such an eventful occasion, because the highest mark of approval that could be shown to any artist was found in the good opinion of the men whose knowledge he valued. The gold medal conferred by architects conveyed with it the good wishes and the high appreciation of brother artists. Sir Aston Webb was the friend of all young artists and architects. He was the man they needed in the present day, because he believed in the responsibility of the great art which he followed.

Sir ASTON WEBB, in response, said:—The presentation to me of this Royal gold medal given by His Majesty the King on the recommendation of my brother-architects, the members of this Institute, fills me with an overwhelming feeling of gratitude which unfortunately I have not the power adequately to express; while the long line of my illustrious predecessors makes me keenly alive to my own shortcomings and makes me appreciate still more

your forbearance in selecting me. I ask you to accept my grateful and heartfelt thanks, for I hold this honour as the highest that can be offered to an architect by his professional brethren, and the medal with the recollection of its presentation this evening will always remain with me as one of my most cherished possessions; and, sir, if I may say so, the pleasure and honour is greatly enhanced by receiving it at the hands of so distinguished an architect and so old a friend as yourself—one with whom it has been my pleasure to work for so many years, accompanying it, as you have been kind enough to do, with words which have still further increased my pleasure and obligation. You have also, sir, with that high imagination with which you are gifted, painted a portrait of me for which I thank you most gratefully, all too flattering though it be. I do not propose to-night to interfere with the work of a brother artist who has made much out of such poor material; for though it is certain that from my very intimate knowledge of the sitter I could add a few realistic touches which would undoubtedly increase the likeness, at the same time I fear they would spoil your picture, and so I feel the best thing for me to do is to leave well alone.

Again, it would ill become me on such an occasion as this to speak of my work which you, sir, have already referred to in so flattering a way. The drawings shown here to-night (by special request) show what great opportunities I have had, and I am afraid also how far short I have come to realising them. I can only say I have tried my very best and done my best, and where I have failed it has not been through idleness or neglect on my part.

There is, however, one work on which I am engaged on which I should like to say a word, viz. the architectural surroundings for the great National Memorial to Queen Victoria, by Mr. Brock, in front of Buckingham Palace. Owing to the time this great work of Mr. Brock's necessarily takes to execute, we have been enabled to proceed with the architectural work of preparing the site in sections, doing a portion of the work (such as alterations to roads, &c.) each autumn at a minimum of public inconvenience, and thus (as we architects usually have to do) painting the picture, as it were, wash by wash, in the full gaze of the public, who, apparently, and not unnaturally, seem to think that each last wash is the final one, whereas I need hardly say there is much yet to be done. The next work will probably be finishing the piers that form the three gateways into the enclosure with groups of sculpture emblematic of the three great self-governing colonies, for which three eminent sculptors have been commissioned under the general direction of Mr. Brock. A start will also shortly be made with the foundations for the building at the east end of the Mall through which, under three archways, will pass the great road into Charing Cross. The idea of placing the building, as shown is to form a worthy termination of the Mall and also to screen the change of axis between the Mall and the Strand. But when all the architectural work has been done, it will still be but a frame without a picture, and the public must be kind enough to suspend its final judgment until Mr. Brock's splendid work is completed and forms a magnificent centre to the whole, all the other work being subsidiary and complementary to it. With regard to the general effect, time only will give the trees needed to turn the broad walk through the Green Park into a shady avenue like the broad walk in Kensington Gardens, to which it is equal in width, and time only can make the trees meet overhead and shade the footways on either side of the Mall from the Palace to Charing Cross.

Ruskin long ago pointed out the main distinction of architecture over the other arts, in that we architects alone amongst artists are called by necessity to "fraternity of toil," and on an occasion such as this one naturally thinks of the number of fellow-workers to whom one is of necessity so largely indebted before a great building can be erected and finished. Many of my fellow-workers have honoured me by being present here to-night, and I thank them for their presence. To my friend Mr. Ingress Bell, with whom I have shared many successes and disappointments during the last twenty years, I owe most of all, as do the buildings in which we have been jointly associated, not only in matters architectural, but in many other walks of life in which his example has inspired me. The work we have done together has always, thanks to him, been to me one of my greatest pleasures: one of the results of it is shown here to-night in the new buildings for Christ's Hospital.

To my staff I am also largely indebted, ever changing as it is, for it is my happiness to have young men and to see

them one by one launch out for themselves. When they leave me it is as personal friends, and I hope they feel they have had a real share in the work we do together, and that they have helped me to the honour you have done me to-night, as they most assuredly have. I often feel they have all the drudgery, I have all the fun; but their turn will come. I have also been most highly favoured in having had the advantage of life-long friends to work with in almost every department. My surveyors, Messrs. Corderoy & Selby, have worked with me from the very beginning. We all know the invaluable aid surveyors give us in the preparation of the indispensable quantities and interminable measurements, and in the unravelling of apparently hopelessly tangled accounts, and in many other ways relieving us from much anxiety and leaving us free to more congenial work. I often feel their work is hardly recognised as it should be. In the main and great branch of our work represented by the builders I have also been most fortunate, and I owe them much in every way, especially for their skill in setting out the work and fulfilment of one's designs, for which, again, I fear we do not always give them full and adequate recognition. In no time, I believe, was better and more lasting work done than at the present time. Very important also to us are our clerks of works: many have served me faithfully for years, and they are also represented here to-night, for they also have materially aided to the event of this evening. Then there are a crowd of craftsmen and artificers to whom I am greatly indebted for many years of highly skilled assistance carefully rendered, but whom it would be impossible to mention in the time at my disposal, though I hope it may appear to you but right and just that I should make this slight acknowledgment of the invaluable assistance I have received on such an occasion as the present, and will pardon me for having after all spoken more of myself and my work than I had intended. I will promise, however, not to so offend again.

My predecessors in this honour—and I am amazed indeed to find myself in such fine company—have usually, I think, spoken on these occasions on the condition of architecture as they found it in their time and the different phases they have represented, each no doubt firmly believing they were on the right track, from Cockerell, the first medallist and the most refined of Greek architects; through Barry, the most refined Renaissance architect; and so on through the Gothic school of architecture to the archaeological Gilbert Scott, the vigorous Street, the scholarly Pearson and the practical Christian, and now what do we find? Much progress, as it seems to me, much improvement, a closing up of the ranks, a desire to pick up the strain of English Renaissance where we last left it, giving it a distinct flavour of our times, making tradition our servant rather than our master; so that while we endeavour to make our buildings as beautiful as we can, we are determined at the same time to build sanely and reasonably, and, so far as in us lies, beautifully; to make the necessities of the building develop the design, and not to be content until we have met all modern requirements of planning, and naturally combined these requirements with a fitting architectural exterior and interior, not ignoring what has gone before, but eschewing whatever appears to us to be evil and holding fast only to that which is good; that I verily believe to be the tendency of to-day. I have always been an optimist in the work of my brother-architects and am so still. I see in this tendency to work on parallel lines a possible, indeed probable, loss of individuality; and in a recent case, where I had some 130 anonymous designs before me, I found it impossible to recognise the authors by their drawings. I say there is a certain loss in this, but I believe it will be made up by a general improvement and levelling up of work executed.

We must believe in our art if we are to advance it; we must believe in and encourage each other's work if we are to go forward, as I believe we shall go forward; for there are signs of a greater pride of citizenship arising, and a dawning of belief in the necessity of the city beautiful as well as the city useful. Let us see that we are ready to realise these aspirations as they arise, for hard-headed, practical men are beginning to realise that noble dispositions in a town, noble streets and buildings, are an education as necessary for the higher development of patriotism and public spirit as good water and sanitation are necessary for the bodily well-being. A certain sinking of individuality may be necessary to secure the harmonious whole: this we must be ready to give; the general result on the city and on our building must be our sole and chief concern, and we

must be content to sacrifice ourselves if necessary for the general good. Will you pardon me if I quote Ruskin once more on fraternity of toil? He said in that famous lecture of his before the Architectural Association:—"In those misty and massive piles which rise above the domestic roofs of our ancient cities there was—there may be again—a meaning more profound and true than any that fancy so commonly has attached to them. Men say their pinnacles point to Heaven; why, so does every tree that buds and every bird that rises as it sings; but this they have of distinct and indisputable glory, that their mighty walls were never raised and never shall be but by men who love and aid each other in their weakness, that all their interlacing strength of vaulted stone has its foundation upon the strong arches of manly fellowship, and all their changing grace of depressed or lifted pinnacles owes its cadence and completeness to sweeter symmetries of human soul." This, I take it, is the poetical way of saying we must pull together and work together, look forward and not look back, and believe in ourselves, in each other and our art; and this, I take it, is the main purpose of this Institute of ours. It seems to me to-night as if it were but yesterday that I first commenced to practise, and yet this function reminds me that I am rapidly arriving at the other end. No matter, this is as it should be. We hear the next generation already trampling at our heels, ready to take up the work and to carry our art, as I believe, further than has ever been done before. Mr. President, ladies and gentlemen, I have trespassed on your time and patience too long. It only remains for me once more to thank you with all my heart.

Mr. T. E. COLLCUTT asked the President to accept on behalf of the Institute a portrait of Sir William Emerson, painted by Mr. J. J. Shannon, A.R.A. The speaker said he lacked the words to fully express the great esteem the Institute had for their past President. Sir William Emerson would be remembered by all for the soundness of his judgment, his tact and courtesy, and for the fearless manner in which he expressed his views—views that were sometimes a little controversial. As an architect Sir William Emerson had made a name that commanded the respect of all his brother artists.

The PRESIDENT formally accepted the portrait, and remarked that Sir William Emerson appeared to be looking upon a great and important work that had been entrusted to him, and it was on such occasions that an architect looked his best. They could congratulate and thank Mr. Shannon for enriching the Institute with one of the most successful of his many wonderful portraits.

THE ANCIENT BRIDGE OF STIRLING.

THE low state of the river Forth has enabled investigations to be made in connection with the vexed question of the site of the bridge over the river existing at the time of Sir William Wallace's famous victory in 1297. These have resulted in the discovery of the foundations of two piers in the bed of the river about 65 yards above the present old bridge and nearly parallel to it. The centre of the north pier is about 25 yards from the north bank of the river. The distance between the north and the south piers from centre to centre is from 20 to 25 yards, and from centre of south pier to south bank a distance of 25 to 30 yards. The piers are about 28 feet long by 14 feet broad, and have been constructed in a similar manner to the piers of the present old bridge, having a jacket of dry stones round them for support. This interesting discovery confirms the views set forth in a recent paper read before the Stirling Natural History and Archaeological Society by Mr. W. B. Cook, and which are also held by ex-Bailie Ronald, an eminent local antiquary, that the ancient bridge of Stirling was erected at or near the site of the present old bridge, and that the local tradition of a bridge at Kildean is a mere myth. Further investigations will probably be made in order to definitely settle the question,

Mr. W. A. Ducat on behalf of the Local Government Board held an inquiry on the 16th inst. at the Public Buildings, Smethwick, into the application of the Town Council to borrow 15,000*l.* for the erection of the new municipal buildings. The present town hall was erected in 1866, and only accommodates a few of the municipal departments. The cost of the proposed buildings is estimated by Mr. F. J. Gill, the architect, at 17,000*l.*

NOTES AND COMMENTS.

Long before the war of 1870 the different kingdoms, principalities and dukedoms aspired towards an unified Germany. That spirit produced remarkable results, but it did not expire after the ceremony in Versailles. It still exists, and is displayed with vigour in commercial and manufacturing contests. An English firm has not to compete only with a similar firm in Germany. He has as opponents all those who are willing to combine in order that Germany can claim a victory. This mode of action is so contrary to English practice as well as to the dogmas of the political economists that many people in Great Britain believe it is only a subterfuge invented as an excuse for the deficiencies of English manufacturers. Nevertheless, when we find that four syndicates of coal merchants, pig-iron merchants and producers of steel are prepared to grant bounties on the iron and steel manufactured for the export market, it becomes evident that a strategy is being followed out which the old-fashioned system of attack and defence cannot meet. With all their metallurgical and chemical knowledge Germans cannot produce steel at less than from 5*l.* to 5*l.* 10*s.* a ton. But a foreigner who has been dealing with an English firm can obtain an unlimited quantity from Germany at about 4*l.* 5*s.* a ton. There is, of course, a loss, but it falls only partially on the manufacturer of steel. He is helped out of his difficulty by representatives of allied trades who are likewise eager to have a share in the German monopoly which is expected to be the result of underselling English producers. The only remedy in such a case is a similar combination, but the conditions under which English trade has been conducted for centuries are unfavourable to this solution.

THE corps of Royal Engineers have been connected with Chatham since 1812. The corps itself does not date beyond 1783, previous to which any engineering duties required were undertaken by officers of the regular army. Chatham was selected because fortifications were needed and experiments could be made on a small scale which were afterwards to be carried out in important seaports. A new idea of army organisation now prevails, and it is considered advantageous to bring the Royal Engineers into closer contact with the Army, leaving the Navy to make use of the Engineers' buildings at Chatham. Cooper's Hill College will be used as a training school; it will, no doubt, have to be enlarged; the battalions are to be transferred to Tidworth, where there are barracks. The change cannot be accomplished without a large expense, but if efficiency is gained the outlay will not be regretted. Many costly works which were executed by the Engineers at Chatham will, we suppose, be demolished. They served their purposes as means of training officers and privates in construction.

THERE is no certainty that the Royal Hibernian Academy will be able to have suitable galleries erected and provision made for the education of students at the expense of the Treasury. The subject has yet to be investigated by a commission. But the application for aid was received with so much favour, it is easy to understand that various other societies would hasten to try and obtain a share of the bounty. With that object a deputation of the Royal Society of Antiquaries of Ireland met the Chief Secretary on Monday. The President stated that the Society was originally established at Kilkenny in 1849 under the patronage of the Marquis of ORMONDE, and it had gradually grown in public favour until it had become the largest of its kind in the United Kingdom. The Society established with the aid of donations a museum which was practically public property. It remains at Kilkenny, but

some of its most important contents were made over to the National Museum in Dublin. The Society was at present housed in Stephen's Green, where its tenure was precarious, and the accommodation available for its library and fine collection of Irish photographs was such as to preclude their general use. The Society asked to be placed in the same position as the kindred societies in England and Scotland. If the Society is the largest of its kind in the United Kingdom it ought to be able to meet the necessary expenses. There are various archæological bodies in England and Scotland who do excellent work without receiving a shilling from the Treasury. It should be understood that money is not advanced from a Government office unless something is offered in return. The Irish antiquaries would soon discover that they lost much of their independence. The Royal Irish Academy and the Royal Dublin Society were allured by the simple-minded officials of South Kensington to play a game of give-and-take, but they quickly realised that it was intended from the first that they should be losers.

ARBITRATION cases in England which relate to building or engineering contracts are found extremely profitable for lawyers and those who serve as judges. Economy appears to be disregarded, and therefore a Scotch case which has just been ended will probably be regarded with contempt. It arose out of the erection of the Colinton Mains Hospital, which cost between 60,000*l.* and 70,000*l.* The builder, Mr. JOHN LOWNIE, claimed 11,140*l.* for extras, whilst the Corporation of Edinburgh counterclaimed 3,255*l.* for delay. At the beginning of the investigation it was resolved that economy should prevail. Both questions were submitted to Mr. JAMES WALKER, a surveyor, as sole arbitrator. It was further agreed that only one expert should be employed on each side. After several days' hearing the builder's claim was reduced to 6,987*l.* 8*s.* 10*d.*, with interest at 5 per cent.; the counterclaim was set aside. The arbitrator's fee was 600 guineas, his solicitor's 126*l.* 1*s.* 8*d.*, while the builder's expenses were put down at 578*l.* 1*s.* There were no counsel engaged, the whole of the legal work being conducted by solicitors. The arbitrator was able to say at the close of the inquiry:—"At this the completion of our proofs and hearings, I desire to express my great satisfaction with the able manner in which the agents of parties have throughout conducted their cases, and I desire to express the belief that, although counsel had been engaged in the case, the interests of parties could not have been better expressed and the case placed before me in an abler manner than has been done by Mr. GRIERSON and Mr. ROSS. To these gentlemen and to all others interested I owe my thanks." If so important a case had to be decided according to English methods the city of Edinburgh would have had to impose a much larger burden on the ratepayers.

GREENWICH:

GREENWICH, and some few of the records of its interesting past in stone and story, formed the subject of the second summer ramble of the members of the Upper Norwood Athenæum on Saturday, May 20. Mr. V. T. Vincent, the able exponent of the antiquities of the whole of this riparian district, selected Greenwich in place of the proposed visit to Cheyening, postponed by the death of Earl Stanhope. Arrived at Greenwich, the members and friends were met at the church of St. Alphege by the vicar, the Rev. S. Martyn Bardsley, M.A., who very kindly gave an interesting account of the church in the vestry, and then escorted the party over the building, explaining each point of interest in a genial and interesting way. In the registers he showed the entry of the baptism of Charles George, son of Henry William and Elizabeth Gordon, on February 28, 1833; the record of the burial of General Wolfe in 1759, whose grave in the crypt was also seen, and to whom the stained-glass window in the church was erected by a former churchwarden in memory of "a noble Greenwich man." In another register is recorded the marriage on November 18, 1685, of "ould" Cooper, aged 108, to Margaret Thomas, aged 80, by special license. In the church itself the Vicar pointed out the beautiful carved woodwork, the pulpit with its quadruple hour glass—one glass for each quarter-hour of the sermon—the royal pew, the windows with figures of St. George and St. Alphege, commemorating General Wolfe and the Rev. Brooke Lambert, others recording the Christian rites in their application to former royal residents of Greenwich, and tablets in memory of Tallis, the musician, d. 1585, and Airy, the astronomer. After the crypt had been inspected the party proceeded to the park, where the small but interesting remains of the recently-discovered Roman pavement were examined under Mr. Vincent's guidance; then to the park-keeper's house, where the many objects of Roman antiquity found in the park were examined with interest, including the coins of forty Roman emperors, from Marcus Antoninus, c. B.C. 35, to Honorius, A.D. 395-423. Proceeding through the beautiful naturally-arranged gardens formerly called the Wilderness, and passing by the site of Montague House and the Ranger's House, the twenty or more barrows at the top of Rooms Hill were seen and described by Mr. Vincent.

At the evening meeting Mr. Vincent read the following paper:—

Greenwich is the Anglo-Saxon word Grenawic, meaning the green town or village on the river bank.

As recently as the reign of Henry V. (1420) it was but a fishing village, but the river was always such safe anchorage that the whole of the Danish fleet lay here for three years in the reign of Ethelred (1011) while the invaders, camping at Blackheath, ravaged the country round. It was here that they murdered Archbishop Alphege, whom they had brought prisoner from Canterbury. The first mention of Greenwich is in a deed dated 918, in which Ethruda, otherwise Elfreda, daughter of King Alfred the Great, bequeathed the manor to the Abbey of St. Peter at Ghent, a bequest of doubtful advantage to the Flemish monks owing to the reluctance of the tenants to be taxed by foreigners, and possession was virtually abandoned some time before the arrival of the Conqueror. In 1414, when the alien priories in England were dissolved, the manor came to the Crown, and it has been State property ever since. But there was a Royal manor here from the time of Edward the Confessor (1060) and frequently a Royal residence. The park was laid out by Humphrey, Duke of Gloucester, in 1433, under a grant which permitted him to enclose 200 acres of Blackheath, and he built the palace or pleasure on the site now occupied by the college, museum and hospital, which, when the duke died intestate and childless, was taken possession of by the Crown. The common expression "to dine with Duke Humphrey" refers to the builder of Greenwich Palace, but its meaning is a little obscure. The residence was enlarged by Edward IV., Henry VII. and Henry VIII., whose birthplace it was, and the birthplace also of his children. The park has been the scene of many tournaments, and Henry VIII. was especially fond of seeing and taking part in contests with the sword, lance and battle-axe. Queen Elizabeth was very partial to Greenwich, and made it her chief summer residence. Her successors of the Stuart dynasty followed her example, and although in the time of the Commonwealth it was proposed to sell the house and park, they were retained for the use of Oliver Cromwell. At the Restoration the house was found to be much out of repair, and

Charles II. spent 36,000*l.* on building a new palace, of which Christopher Wren was the architect, but did not finish the work. He also put a wall round the park as we now see it, in place of a wooden fence, and he built the first Royal Observatory on the site of a tower which Duke Humphrey had erected on the hill. The new palace remained unfinished until the abdication of James II. and the accession of William and Mary, when it was completed and converted into a hospital and asylum for decayed seamen. About 50,000*l.* was spent, but it was not until Queen Anne was on the throne in 1705 that the first hundred pensioners were admitted. Every man in the navy paid 6*d.* a month to it, and the funds were so swollen by gifts and legacies as to maintain 2,000 old seamen and 140 orphans. The Greenwich pensioner was a well-known character for 160 years, when the hospital began to grow unpopular, and it was abolished in 1869, the revenues being converted into out-pensions. The buildings remain as a noble monument of good intentions. The hospital school for the sons of seamen, which was part of the original scheme of the hospital, continues to do excellent work, providing for about 1,000 lads, most of whom, though under no obligation to do so, enter the Royal Navy.

The parish church of St. Alphege is named in honour of the Archbishop of Canterbury who, as just stated, was martyred about 1011 by the Danes, who stoned him to death. The original church was probably erected soon afterwards and on the spot where he died. In 1710, having become much decayed, the roof fell in, and the present building was erected in its place. Part of the old walls may be seen worked into their successors.

Greenwich Fair, always more or less of a riotous character, was formerly held in the park, but in 1838 it was expelled the park, and the booths and stalls were set up in the streets near the church, where it continued to be a public nuisance until its final suppression in 1856.

A few more words about the park. In the reign of Henry VIII. the park was at the height of its glory, and right royal revels were held there. In the spring there was the ceremony of bringing home the May, at midsummer there were bonfires and fireworks, and at Christmas there were all manner of frolics in the palace. The lower level of the ground near the principal gates was used for tournaments, and a stand was erected for the ladies. The jousts were usually held in February or May, and lasted a week, from two till five in the afternoon. As many as 300 spears were sometimes broken in a day. Bluff King Hal, who was a good horseman and a powerful and skilful fighter, generally came out victorious. Queen Elizabeth's favourite spot was the old oak which bears her name. It was a hollow trunk even in her time, and was convenient for refreshment. Charles I. was the last sovereign to occupy the palace, but the Princess Sophia resided in the Ranger's House in 1816, as did Prince Arthur, now Duke of Connaught, while he was studying at Woolwich Academy. As a public recreation ground the acquisition of the park was a slow and gradual process, not completed until the last century. For many years privileged persons had keys of the gates, but the liberty was gradually extended, and as long as I can remember there have been no restrictions whatever, except that the upper portion of the ground was until recently enclosed as a garden for the Ranger's House. This is now thrown open to the public, and is much appreciated. Near the Ranger's House is a curious bath, discovered in 1890 when an old summer-house was demolished. The sides of the bath and the steps were then covered with white tiles. It was in close proximity to a bricked-up gate in the wall of Montague House, in which Queen Charlotte once resided when separated from her husband, the Prince Regent, afterwards George IV. Nearly opposite the bath is a miniature redoubt constructed by Prince Arthur when he was a cadet at Woolwich.

Many traces of the Roman occupation have been found in and about the park, the most important being the discovery in 1902 by Mr. A. D. Webster, late superintendent of the park, of a tessellated and concrete floor, which had undoubtedly at some period 1,500 or 2,000 years ago formed part of a Roman villa. The remains were found while probing the soil with an iron rod to find traces of an old road which Mr. Webster believed to have formerly existed near the spot, and the site is an artificial mound near the Vanbrugh Castle Gate. The area of the floor is not extensive, and there are no walls left, but it is clear from the character of the workmanship that the house when it stood was occupied by a person of rank and wealth, and that it was large. The reason why it was erected in such a spot

is also very obvious, not only from the surrounding scenery, but from the abundant water springs now forming the ponds on the hill. The villa itself, however, is not so remarkable as its contents. The area it covers is not one-hundredth part the size of the Roman villa at Darenth, and yet in this limited space, and round about it were collected a hoard of curiosities quite as numerous, as varied and as distinctive of the Roman era in Britain as were gathered and preserved when the Darenth villa was unearthed in 1895. There were no fewer than 320 coins discovered, dated from 35 B.C. to A.D. 395, and representing forty of the Roman emperors who reigned within that period. There were also some barbarous British imitations. The other articles exhumed included some early British as well as Roman pottery of various types, implements and ornaments in ivory and bone, bronze and iron, pieces of wall plaster elegantly decorated, and much burnt wood, with nails and staples attached.

Quite on the other, or western side of the park, are twenty-five or more British barrows, all of which have apparently been opened and plundered, but each of which marks the burial-place of some important personage of probably prehistoric times. About ten others are found in other parts of the park, and twelve were destroyed when the adjacent reservoir was built in 1846, and a number of stone implements were found, which are now in Greenwich Museum. We read that fifty such mounds were opened here in 1784, under authority, but only one skeleton was found, and only a few of the ornaments such as the ancients interred with their dead, a fact which is not remarkable, seeing that a parkkeeper named Hearn had seventy years before opened all the barrows on his own account.

It may be mentioned as an item of antiquarian interest that several subterranean passages in the park have recently been explored, and may be visited by small parties, but will hardly repay the trouble, for they are all probably the culverts which formerly supplied water from the hill to the palace and other dwelling-places round about. They are for the most part 6 feet high and 4 feet wide, and well built of brick.

A meed of praise is due to the late superintendent, Mr. Webster, for the work he did during the comparatively short time he was in charge of this park. He has now been advanced to the more important but less attractive superintendence of the Regent's Park, but his work here remains. Mr. Webster is a second Richard Jefferies, "The Gamekeeper at Home," for he is not only an expert woodcraftsman and student of nature in all its forms, antiquary and scientist, but he has the literary capacity for embalming his ideas and knowledge in books, "Greenwich Park: its History and Associations," being the outcome of his labours in this direction.

THE ROMAN CAMP, LANCHESTER.

THE members of the Durham City Field and Research Club lately visited the Roman Camp and the parish church of Lanchester, under the guidance of the Rev. A. Watts, the president. According to the *Durham Advertiser*, the Roman walls of the fortress are still standing round almost the whole of the six acres which formed its site. They were of great thickness, 8 feet at the base, narrowing to 4 feet. But the facing stones have been taken away to erect field walls and modern buildings, and only the core remains. The great northern Watling Street ran past the Roman station at a few yards distance from it on the eastern side, cutting the Lanchester and Wolsingham road nearly at right angles. After a tour round the walls Mr. Watts said the British camps were circular, Roman camps were square. Our ancestors had a stronger eye for the artistic. The Romans were for utility. That camp was probably built about the year 120. The Romans, if they could get it, built their walls with millstone grit. If they could not get the latter they got the finest hard sandstone that could possibly be found. The facing stones of that camp were, as he had shown them, of a wedge shape. This was for the convenience of carriage. A man could carry two, one on each shoulder. They felt pretty sure that that camp was built in 120, because 100 years later it had fallen into ruin, and another emperor, Gordian III., found it necessary to rebuild the barracks and arsenal. Gordian III. died in 244, so that the repairs must have been made before that. They might say roughly that the arsenal and barracks of that camp were repaired by Gordian II. in the year 240. The same emperor built public baths and a basilica.

This seemed to indicate the fact that that was not only camp, but that a considerable population had gathered, and that Lanchester had sprung into being a place of some importance. There was an old saying that cleanliness was next to godliness. He often thought they got that saying from the fact that in the Roman worship washing formed an important part of the service. Here they had the temple built alongside the public baths. It was probable that the four large monolithic pillars in Lanchester Church, each out of a single block of stone, were once pillars supporting the arcade of the basilica. They knew full well that in early, middle or dark ages English masons were not capable of work like that. The Romans were experts at it. Although it could not be said with any degree of certainty yet it was exceedingly probable that when they came to build Lanchester Church, instead of getting and working pillars for themselves, they came and unearthed the tumble-down pillars from the ruins of the old Roman camp, pillars which had formed part of the heathen temple erected by the Roman emperor Gordian III. about 240. Well-preserved stones in the Dean and Chapter library recorded the names of the civil and military governors of the camp at the time the repairs were made, when the barracks and arsenal and also when the new buildings were erected—the baths and basilica. After Roman times they fell upon the dark ages and the camp was of no practical use. There were very few people in Lanchester. There would not be more than two or three persons to the square mile in the county of Durham until the seventeenth century. The camp, therefore, suffered no destruction except at the hands of nature. Some features gradually crumbled away, but the character of the stone was such that it suffered very little in that way. The very tool-marks of the Roman masons might be seen on the face of the stone. Each man had his own method of using his chisel. They cut their lines in certain directions and so the work of one man was distinguishable from that of another. Beyond all doubt two hundred years ago that would be a splendid camp, but the same spirit which led Church people to take the monolithic pillars from the temple and use them in the church at Lanchester moved the farmers around, and when the population began to grow they wanted to make building easy, and so took the worked stones from the face of the wall of the camp. They came and got them for themselves. That was how they found the whole face of the camp defaced till there was nothing but the core of the wall left. That had been done almost within living memory. This showed what little respect there was for ancient things. It also showed how ignorant the people must have been. They did not know and did not appreciate the value of these things, nor of their evidence as links to the past. For instance, Canon Greenwell himself told how his grandfather was a chief mischief-maker in the camp. He got almost all his material for building Ford from the camp. The first description of the camp appeared in 1850, almost within their own time. That fact also showed how little interest people took in it. No one had left a written description of the appearance of the camp until McLaughlan's survey of Watling Street. He told them that at that time there were four towers standing at the four corners. There were remains of a building in the interior of the camp. There was now nothing but a green mound. In the north-west corner were two buildings with rounded ends. They were built for hypocausts, which showed that the Romans heated their camps by hot air. Mr. Watts went on to refer to Watling Street. He said this great Roman road was not called Watling Street by any of the old recorders. Simeon of Durham spoke of it over and over again in his records, but always in the county of Durham called it Deor Street. They had there probably the derivation of Durham.

Referring to a Roman altar in the porch of Lanchester Church, Mr. Watts said the baths built by Gordian III. were supplied with water brought some three or four miles by aqueduct from the high ground away towards Rowley. It was brought by two branches, and they could trace the aqueduct for a considerable distance in land never touched by plough. Another part of it could be traced through the channel at the back of Marjory Flat. One source where good springs were found yielded the altar. It was manifestly erected to commemorate that an important and permanent supply of good water had been secured. The inscription recorded the fact and the purpose for which it was erected. This altar carried them back to pre-Christian times. The Romans were not Christians. They were persecutors of Christians during the time of the early persecutions. Mr. Watts referred to another precious stone

and a few years ago when the church was being enlarged to make provision for an organ chamber. In breaking through the walls they found this stone had been used as a building-stone. He was glad to see it where it was. A portion of a memorial stone next engrossed attention. It doubtless marked the burial-place of a heathen. There is no Christian symbol whatever, but a rude representation of the sun. He might mention that the other source of water supply for the camp yielded an altar and by Mr. Edward Balleny, of Little Greencroft. It was found close to a place where the water had to be carried over a little ravine. The aqueduct at that point would be about 30 feet high. Probably that is its highest point. The altar was preserved by Mr. Balleny in his grounds. The astonishing part of the whole thing was that these stones had been discovered within the last 100 years. This showed how utterly oblivious of these valuable records were their ancestors. Mr. Watts next referred to two floriated crosses, one belonging to a crusader of the Middle Ages. A pair of shears on the stone indicated that one had been placed over the tomb of the crusader's lady. The short sword on the other indicated that it was the tombstone of a man. Had he been a priest there would probably have been a cup, showing that he had ministered Holy Communion. Passing into the church, Mr. Watts said that originally this church, like most Norman churches, was a simple rectangle. The south wall stood where the south arcade is, and the north wall where the north arcade is. The chancel arch was a very noble representation of Norman work, almost equal to that in the style of Durham. When they built on the north aisle they brought these monolithic columns from the Roman camp. Mr. Watts directed particular attention to the striking difference between the small stones built to form the pillars of the south aisle added later, and when there were no pillars to pillage from the Roman camp. He was glad to see in one of the recent changes at Lanchester Church they had supplied a new font from local stone, Frosterley marble. He thought that in all their churches and work they ought, as far as possible, to use the stone of their immediate neighbourhood. Mr. Watts went on to refer to the beautiful markings in the Frosterley marbles, and was glad to say that three years ago they found a new bed of good black marble, which was being worked and sent all over England.

SCANDINAVIAN INFLUENCES ON NORMAN SCULPTURE.

IN the recently-issued part of the "Saga-Book of the Viking Club" there is a long and learned article by the Rev. H. J. Dukinfield Astley, of Rudham, on "Scandinavian Motifs in Anglo-Saxon and Norman Ornamentation." He contends that while much of the art of those periods was derived from Byzantine, Saracenic and Late-Celtic sources, more of it owed its origin to Scandinavian and later Viking motifs than was generally admitted, and that these might be carried back to the art of Halstatt and La Tène and perhaps to earlier days still. Some of the Scandinavian influence is exercised directly and some indirectly, through the Normans. Mr. Astley contends that the interlacing pattern was derived from the snakes and dragons of Norse mythology. The dragon Fafnir, slain by the sword of Sigurd, is represented in Sweden, Norway and England. Continuing, Mr. Astley says:—"So the animal fades away and the ghost alone remains in what to ordinary eyes is only an entwisted fibre, as for instance in the detail on Tatton's Cross, Lancaster; that on a stone coffin in Cambridgeshire; on the Saxon fonts at Deerpur and Bridekirk, and on many a Norman font, of which those at Tofrees, Shernborne, Burnham Deepdale, Ingoldisthorpe, and Sculthorpe in North-west Norfolk, are among the most perfect examples." With the exception of Shernborne illustrations of these fonts are given. In an appendix on the illustrations the writer adds:—

"The font at Burnham shows on three sides a representation of the Anglo-Saxon Calendar, and on the remaining side, that reproduced here, foliage like that on the tympana. Lions, with interlacing tails, run round the top edge of the font. The font at Tofrees is perhaps the finest example shown, with its intricate pattern of cablework and its grotesques. Similar patterns are seen on the fonts at Shernborne and Sculthorpe, which latter contains, on the east side, the representation of the Magi bringing their offerings to the infant Saviour. The character of this mode

of decorative ornamentation has been sufficiently discussed in the text, and need not be further entered upon here; but an interesting question arises as to how it is that so many specimens of this style should remain in an outlying corner of Norfolk. Were they peculiar to this district, or is it possible that they were equally numerous in other parts and have survived here owing to the comparative isolation of the county, and the fact that it seems to have escaped the ravages of the Civil Wars of the fifteenth and seventeenth centuries? The fact remains that, in seeking for illustrations to my paper, I had no less than a dozen examples to select from in this particular district, while only Deerpur and Bridekirk could be found in the rest of England. This is not, of course, to say that other examples do not exist elsewhere, but none, I am persuaded, that would so fully answer my purpose. I am hoping to publish a complete monograph on all these fonts shortly, with illustrations, in the Transactions of the Norfolk and Norwich Archaeological Society."

MR. T. H. MAWSON'S CLAIM.

THE debate which took place in the Court of Session on the relevancy of the action in which Thomas Hayton Mawson, garden architect, sues the Dunfermline Carnegie Trustees for £3,101. 11s. 2d. for services said to have been rendered to the Trustees, lasted a whole day. The following statement of the points in dispute has been published in the *Dunfermline Free Press*:—

The pursuer, in his statement of claim, says that he is an Honorary Associate of the Royal Institute of British Architects, and carries on the profession and business of a garden architect at Hazelwood Offices, Windermere, and 28 Conduit Street, London. On or about September 25, 1903, the pursuer received from the interim secretary to the defenders a letter, dated September 24, in the following terms:—

"Clydesdale Bank Buildings, Dunfermline :
September 24, 1903.

"Carnegie Dunfermline Trust.

"Dear Sir,—At a meeting of the Trustees on Tuesday last I was instructed to communicate with you and send you the enclosed print of the Trust deed, Mr. Carnegie's letter and Dr. Ross's address. The Trustees will be glad if you will undertake to furnish them with a report on the laying out of the park and glen, and the erection of the needed structures suggested by Mr. Carnegie in his letter.

"I do not think it necessary to give you any instructions, but I might suggest that you arrange for an early interview here with our chairman, Dr. Ross. If you can give this question your earliest possible attention I shall feel much obliged.—I am, yours faithfully, JAS. CURRIE MACBETH,
"Interim Secretary."

The address referred to was given by Dr. Ross, the chairman of the Trustees, at their first meeting held on August 28, 1903. After consideration of the letter and accompanying documents, the pursuer went to Dunfermline, and on October 2, 1903, met the defenders, Dr. Ross and Mr. Henry Beveridge, at the former's office. At this interview the pursuer was shown a plan of Dunfermline, with Pittencreef Park lined round in red, and the pursuer pointed out to the said defenders that the success of a design for the park would depend very largely on its entrances and direct communication with the town, and that unless the park was to be separate from and not a part of the town, direct communication with the main thoroughfares of the town was a necessity. In particular, the pursuer stated that an entrance at the end of Bridge Street was most essential. Dr. Ross replied that the Trustees had already considered this, and had made inquiries with a view to purchasing the property necessary for an entrance. The sum asked for was considered too high to justify them in purchasing at present, but that the pursuer's design might be arranged with a view to the acquirement by the Trustees of the property necessary to provide said entrance when a favourable opportunity occurred for purchasing same. Thereafter, on the same date, the pursuer, along with Dr. Ross and Mr. Beveridge, inspected Pittencreef Park and glen and the rest of the property acquired by the Trust, as well as other property adjacent to the park and glen which Dr. Ross pointed out as likely to be acquired by the Trust. Dr. Ross proceeded with Mr. Beveridge to the manse, at the back of which Dr. Ross suggested an entrance might be made. At the end of the meeting with Mr. Ross and Mr.

Beveridge, the pursuer said that if he could arrange the entrance to the park satisfactorily, so as to give the park and glen their proper connection with the town, he thought he could give the Trustees a satisfactory scheme. The impression left on the mind of the pursuer was that the defenders, before definitely deciding how they were to carry out the Trust, desired to obtain from him skilled advice as to the best methods of laying out the park and glen, erecting the necessary buildings, improving the vicinity, and generally giving effect to the views expressed in the letter and address which had been sent to him as part of his instructions.

In accordance with the instructions received, the pursuer proceeded to prepare surveys, sketches and plans of Pittencrieff Park and glen, and of projected improvements and alterations thereon for the purposes of the report, which was completed and sent to the defenders on or about February 24, 1904. The secretary to the Trustees wrote a letter to the pursuer in the following terms on June 23, 1904:—

"St. Margaret's Hall,
Dunfermline: June 23, 1904.

"Thomas H. Mawson, Esq.,
Hazelwood Offices, Windermere.

"Dear Sir,—I beg to forward you herewith the following excerpt from the minutes of a meeting of the Trustees which was held this afternoon:—The report by Mr. Mawson, which had been circulated amongst the Trustees, was considered. After an interchange of views, it was resolved to retain the report for after consideration, it being impossible at present to give effect to the suggestions contained in it. The secretary was instructed to convey the thanks of the Trustees to Mr. Mawson for his report, which they felt had been prepared with great care, and with an earnest desire to furnish useful guidance in carrying out the work of the Trustees.—Yours faithfully,

"J. H. WHITEHOUSE."

On the same date the secretary wrote to the pursuer a second letter, requesting him to forward a statement of his account against the Trustees in connection with the report, and asked him also to furnish the Trustees with twenty-five additional copies of the report. The pursuer furnished these additional copies, and on July 5, 1904, sent in an account for his professional services, which he limited to the sum of 817*l.* 6*s.* 7*d.* The defenders refused to pay this sum, and on July 29 the secretary of the Trust wrote to the pursuer informing him of this, and stating that the Trustees had agreed to offer him the sum of 300*l.* in full of his services and outlays, including the printing of the reports, but reserving all objections to the account if that sum were not accepted. In reply, the pursuer pointed out that the sum of 300*l.* did not even cover the cost of outside assistance and out-of-pocket expenses, much less anything for his personal time and the time spent upon the plans by his office staff. He accordingly withdrew the account which he had rendered for the sum of 817*l.* 6*s.* 7*d.*, and stated that he was willing to refer the whole matter to the arbitration of a disinterested authority capable of dealing with the question, such as the President of the Royal Institute of British Architects. As the defenders refused to accept this proposal, the pursuer offered, as an alternative, to place the instructions received from the defenders, and his report, plans and proposals dealing with the park and adjacent buildings only, foregoing all claims for suggestions dealing with town improvements, before a measurer appointed by either the Glasgow or Edinburgh Architectural Societies, or the Royal Institute of British Architects, and according to his finding to accept payment on the schedule of the Society selected, with such portion of out-of-pocket expenses as might fairly be judged due to the pursuer. The defenders did not accept this proposal, and the pursuer then offered as a further concession to submit to the decision of a barrister, provided he were nominated by the Royal Institute of British Architects, explaining that he made this proviso because there would be the assurance that the assessor so nominated would be a man used to and capable of dealing with disputes of the kind in question. The defenders, however, refused to agree to the pursuer's proposal, and adhered to the offer made by them on July 29, 1904. Pursuer adds that the sum of 817*l.* 6*s.* 7*d.* did not by any means adequately represent the amount to which he was legally entitled as fair and reasonable remuneration for his services, and in reimbursement of the expenses incurred by him in consequence of the defenders' instructions, although he was willing to accept

that sum on the assumption that he should receive immediate payment thereof. He subsequently prepared and rendered to the defenders an account charged in the ordinary way, and amounting to 3,101*l.* 11*s.* 2*d.*, the sum now sued for.

The Trustees then entered into a large number of details relating to the park and to the property which were suggested for its improvement. They consider that the park and glen could not contain the buildings, designs and works suggested by the pursuer. A plan of the park furnished by the pursuer extends far beyond the bounds of the park and glen, and shows that parts of the town itself would have to be destroyed, even to give room for tennis or bowling-grounds suggested by him, and there are numerous extraordinary and extravagant suggestions wholly outside the scope of the pursuer's employment or even experience, e.g. the building of a concert hall to cost 60,000*l.* It is impossible to extract a scheme for the treatment of the park and glen from the report and relative plan furnished by the pursuer. In so far as he deals with these it would be necessary in order to give effect to his ideas to acquire properties not fewer than eighty in number belonging to different proprietors who, even if they were willing to sell, would not part with their properties under 200,000*l.*

The pursuer's own estimate of the costs of the work connected with his scheme is 110,437*l.*, which is exclusive of the acquisition of the requisite properties. It is accordingly impossible to utilise within the park and glen any portion of the pursuer's report. The pursuer, however, declines to curtail it or modify it, or "make it deal only with the park and glen and glebe" as suggested to him in Dr. Ross's letter of February 29, 1904. In these circumstances the defenders, while willing to make allowance for the pursuer's evident mistake as to his position, have been in a difficulty how to act as to making any payment to him, but they considered that they would not be exceeding their duty if they offered him 300*l.* so as to get rid of his claim, and to be remuneration on the amplest scale for any services of the pursuer. The defenders aver that the account now sued for was not incurred and is extravagantly charged.

The pursuer in his answers to the defenders' statement of facts denies that there was any undue delay in furnishing his report. He alleges that the defenders' offer of 300*l.* is quite inadequate.

Lord Dundas remarked that the case seemed to be a very appropriate one for parties to make some friendly arrangement between themselves. It looked at present as if there had been misunderstandings on both sides, and it would be a pity if the matter was not settled without the expense and heat of a disputed litigation.

SCOTTISH ECCLESIOLOGICAL SOCIETY.

THE Scottish Ecclesiological Society held their third annual excursion on Saturday, when over fifty members visited St. Andrews. At St. Salvator's Church Mr. Maitland Anderson read a paper on the history of the building. He pointed out that it was originally a collegiate church, and not merely a college chapel. Bishop Kennedy's idea was to combine into one institution a collegiate church and what would now be called a university college in order that religious observances might not merely be fostered, but that men might be trained up to perform them intelligently as well as to study and interpret the Holy Scriptures. The clergy connected with the foundation included a provost and three canons, besides various prebendaries, chaplains and choristers. The church was richly ornamented with costly furnishings of all kinds, and on festival days must have presented a scene of splendour unrivalled by any other collegiate church in Scotland. At the Reformation, although no rude reformer laid violent hands upon it, the church was closed and all that belonged to it disappeared. In 1563 it was fitted up as a commissary court-room, and remained the official seat of the Commissary until 1823. In the sixteenth and seventeenth centuries it was occasionally used for worship in connection with the parish church of St. Andrews, and in 1633, at the instance of Archbishop Laud, an effort was made by King Charles I. to convert it into a university church or chapel. Having stood for a long time void and neglected, the Leonardine congregation was transferred to it in 1754, and remained there until July of last year, when the new church of St. Leonard's was opened. Shortly afterwards St. Salvator's Church was reopened as a

iversity chapel with a view to the regular celebration of the worship during the winter session.

At St. Regulus Church and Tower, Mr. MacGregor read a paper dealing with the probable date of building, which he considered would be the latter part of the tenth century.

Mr. David Henry, architect, St. Andrews, read a paper dealing with the building and history of the cathedral and its tower. He traced the course of construction of the cathedral, which he stated was begun in the Transitional style of the middle of the twelfth century, a style that adhered to till near the middle of the thirteenth. Half a century later, viz. in 1271, Bishop Wishart began and completed the nave in the new style then prevailing. Prior to the completion of the age of building and the approach of the age of pulling down. Referring to the researches of recent years, Mr. Henry was of opinion that they had not added very much to our knowledge. A number of pieces of painted glass had been found in the north transept, which were probably the remains of the glass at fire of 1378. Probably the most interesting find had been the stone coffins of the seven priors, whom we knew were buried in the chapter-house, two in the old and five in the new, between the years 1304 and 1416. Mr. Henry concluded his paper with a reference to the grave slabs of several canons of the cathedral. The oldest dated gravestone in St. Andrews was that of Canon Robert Cathine, who died in 1380.

St. Leonard's Church and St. Mary's College were described by Mr. Maitland Anderson.

RUSKINISM IN SHEFFIELD.

THE annual report on the Ruskin Museum for the year ending March 25, 1905, has been published.

The museum was open on 312 days during the official year, and the total number of visitors was 50,736, as against 48,357 the year before, an increase of 3,379. This increase, tokening a wider interest in the Institution and the objects of its founder, has been brought about no doubt mainly by the special exhibition made during the year which is referred to below, by the illustrated lectures to the public, and to the school classes, and also by the notifications placed in the libraries and educational institutions of the city indicating the facilities for the inspection and study of the collections. The increase has been greater in proportion on week-days than on Sundays, the comparison being 9,799 against 36,541, and 10,937 against 10,816 last year.

In the library and print department the figures were well maintained, the number of visitors who made application for perusal and study of the works being as follows:—The total for the year was 622 against 639, and the number of works issued 889 against 901, the latter figure being the record number of issues. The averages for the five years previous were 615 and 777 respectively, last year's figures being therefore progressive over the period stated.

The sale of the illustrated museum handbook shows a remarkable increase during the past year, 526 copies having been sold compared with 433 in the year 1903-4. In addition to this 500 copies of the supplementary catalogue, with descriptive notes of the "Masterworks of Engraving," were disposed of. Of the library catalogue twelve were purchased against twenty-four last year. A supplement to bring this publication up to date is now being prepared.

During the year a special exhibition was made, and took the form of a series of examples illustrative of the masterworks of engraving. The majority of these were loaned by Mr. G. P. Wall, of Sheffield, and supplemented by examples from the museum collections, selected with a view to showing the origin and development of etching and engraving in the various styles of wood-cut, line-engraving, etching, stipple, mezzotint, &c. The exhibition proved a great attraction, and was thoroughly appreciated by many students and visitors throughout the year. A supplementary catalogue with descriptive notes was issued, and two illustrated lectures, which were well attended, were given by the curator on the history and methods employed in these arts.

The curator was instructed to attend the meetings of the Museums' Association held in July at Norwich, and a report of the proceedings thereat was presented at a subsequent meeting of this committee. In connection with a subject which has been much discussed at these conferences and mentioned in the report, viz. "Museums as places of instruction for scholars," communications were made to the Education Department with an offer to give a series of

illustrated lantern lectures at the museum to the senior classes of the boys and girls' schools, at which from fifty to sixty scholars might be accommodated at one time, instead of the limit of twelve or fifteen as in the usual demonstrations in the galleries which count as school attendances, the scholars to afterwards identify the originals of the illustrations in the museum. A list of the lectures offered is given below, the subjects chosen being treated with the express purpose of giving the boys and girls an elementary introduction to the study and appreciation of the collections. In response to this, during five months eight schools made appointments and brought an attendance of 240 scholars.

The museum lectures were also continued during the winter months in connection with the free public lecture scheme inaugurated three years ago. The lectures given by the curator last season were as follows:—Two lectures on etching and engraving: November 12, "The Works of the Early Masters;" December 10, "Later and Modern Works." Two lectures on the art of Carpaccio: February 18, "The Story of St. Ursula;" March 18, "Carpaccio's St. George." A lecture was also given to the members of the Sheffield Art Crafts Guild on "Mural Sculpture at Venice and Rouen as Illustrated by Casts in the Museum." These lectures were fully illustrated by specially prepared lantern-slides of the engravings, drawings, paintings and casts dealt with, and 500 tickets were issued during the season, the lecture-room being well filled on each occasion. A complete list of the lectures which have been given in this connection is appended to this report. In addition to the lectures demonstrations have been given to scholars and other parties who visited by appointment.

On St. George's Day the members of the Guild of St. George met for their annual meeting at the museum. The master, Mr. Alderman Baker, J.P., of Bewdley, Mr. Councillor Thomson, J.P., of Huddersfield, trustees, and the companions of the Guild were received and entertained by the chairman and other members of this committee. After the usual business had been transacted the members expressed in favourable terms their appreciation of the arrangement and satisfactory preservation of the collections, and, amongst other resolutions with regard to future work, decided to actively associate with the movement for the abatement of smoke pollution.

At the close of the meeting the ladies were each the recipients—from the host—of a dainty pair of scissors of Sheffield steel and workmanship, as a memento of their visit to the city.

An interesting and beautiful set of examples of decorative needlework has been sent to the museum by Miss Twelves, principal of the Ruskin Linen Industry at Keswick. These skilful and artistic pieces of linen embroidery, now exhibited in the print-room, are thoroughly representative of genuine hand-woven material and art handicraft carried out by the artisans of the district. It is worthy of note that this is the only industrial art school having Mr. Ruskin's authority to call its work by his name, and is now intimately associated with the work of the St. George's Guild.

The Sheffield Ruskin Club continues to hold the meetings of the Meersbrook Circle at the museum, the chairman of this committee being president, and the curator honorary secretary. During the year about thirty meetings of the different circles have been held. The members of the club meet to read and discuss the works of John Ruskin, with the view of ascertaining how his teachings may be applied to present-day life and effect the betterment of social relations and conduct. The last work dealt with was "The Seven Lamps of Architecture," and the present one "The Eagle's Nest," whilst the books which have been carefully gone through in the past include "Sesame and Lilies," "Unto this Last," "The Two Paths," "Time and Tide," "A Joy for Ever," and "Munera Pulveris." The club held its annual reunion and conversazione in the museum last year by permission of this committee. The members and friends conveyed their thanks for the privilege, stating that it was greatly appreciated and enjoyed.

Several selections of drawings by Ruskin and other artists have been loaned to various institutions. Those returned from the Nottingham Art Gallery were sent to the Huddersfield Art Gallery, others to the Liverpool Ruskin Society, the Guild and School of Handicraft, Chipping-Campden, and the Whitechapel Art Gallery.

Sixty etchings and engravings from Ruskin's works, previously presented by Mr. George Allen, have been framed by the Corporation for use in the room used by the school classes and the Ruskin Club.

Amongst the additions to the collections the following are of special note:—

The volumes issued to date of the library edition of Ruskin's works, presented by Mr. George Allen and the literary executors under the will of the late Professor Ruskin, and reproductions of prints in the British Museum, sent by the trustees. A complete list of the additions is given below:—

List of Museum Lectures.—Ruskin and Social Progress, the Ruskin Museum and Treasures of St. George, the Purpose of the Museum, Minerals and Crystals, Mural Sculpture at Venice and Rouen, Architectural Examples of North France and Italy, Early Italian Masters, the Museum Library, Florentine Painters, Venetian Painters, the Early Drawings of John Ruskin, Drawings for Illustration by John Ruskin, the Later Drawings of John Ruskin, Early Works of Etchers and Engravers, Later and Modern Works of Etchers and Engravers, the Story of St. Ursula as told by Carpaccio, Carpaccio's St. George, St. Jerome and St. Tryphon.

List of Lectures for School Classes.—John Ruskin, an outline of His Life and Work; the Ruskin Museum, what it is intended to Teach; Useful Metals, Precious Metals, Crystals and Gem Stones, a Piece of Flint and some of its Relations, the Beauties of St. Mark's Cathedral, the Story of the Great Palace of the Doges, Some Great Painters of Old, the Story of the Books, Natural History Drawings.

HARVARD HOUSE, STRATFORD-ON-AVON.

A PICTURESQUE building of considerable historic interest was sold by auction at Stratford-on-Avon on Wednesday. Every pilgrim to the shrine of Shakespeare, says the *Birmingham Daily Post*, makes a point of stopping to admire the old gabled house situated in the High Street, and known as Harvard House. It was built in 1596 by the parents of Katherine Rogers, the mother of John Harvard, the founder of Harvard University, and in that house she was born. The front of the house is elaborately carved, the massive supports to the overhanging first floor representing the bear, the badge of the Beauchamps, Earl of Warwick, and the bull, the badge of the Nevilles. The rose and the fleur-de-lys are to be found on several parts of the building, and under the window of the first storey may be seen the initials and date "T. R. 1596. A. R.," standing for Thomas and Alice Rogers. The Rogers family resided in Stratford through many generations from the fifteenth to the seventeenth century, and in 1663 one was a bookbinder in the town. An attempt has been made to localise John Harvard's English home in Devonshire, but it has been indisputably proved that John Harvard was one of the sons of Robert Harvard, of the parish of St. Saviour's, Southwark, and that he was baptized in that parish on November 29, 1607. Robert married the aforesaid Katherine Rogers, and left the old country with a band of Puritan pilgrims and settled down in New England. At the Commencement Dinner at Harvard College in 1885 President Eliot said:—"We have only known about our first benefactor that he was a Master of Arts of Emmanuel College and a Nonconforming minister, that he had a well-chosen library of 300 volumes and some property, and that he was admitted a freeman in this colony in November 1637, and died at Charlestown within a year, leaving his library and half his estate to the infant college at Cambridge, which was thereafter called by his name." The mother of John Harvard must have known Shakespeare when she lived with her parents at Stratford, and afterwards when she was in residence close by the Globe and Blackfriars theatres in London. Harvard's grandfather, Thomas Rogers, was at the time of his death an alderman of Stratford, and Harvard House is considered one of the oldest, and certainly the best remaining example of ancient domestic architecture in the borough.

THE "AULD BRIG" OF AYR.

A PROTEST against the rebuilding of the "Auld Brig" has been sent by the Society for the Protection of Ancient Buildings to the Town Council of Ayr. It states that the committee of the Society have carefully considered the various reports which have been made upon the structural condition of the bridge and have had the advice of a member, who is an engineer, upon the recommendations. The committee express regret that the Town Council should have come to the conclusion that the bridge must be rebuilt, for it is possible to make the bridge structurally secure

without rebuilding in the following manner:—The mortar of the arches has been dissolved by water that been allowed to leak through it, and the arches have therefore moved and lost their shape, throwing undue strain on parts of the arch stones and making them open at the parts, the distortion being increased by the haunches being overloaded. This could, in the opinion of the committee, be corrected by raking out the perished mortar, filling the joints with good cement mortar, and driving slate wedges into the cement. If the undue weight on the haunches were removed, the arch would take a new bearing and would be quite safe. The mortar in the piers has also perished and dissolved. This could in all probability be remedied in the same way as the barrage across the Nile was repaired, drilling holes into the piers and forcing cement grout into them under pressure. The grout would find its way among the sand and stones and fill all vacancies and thus bind the whole firmly together. Although it is not likely that the piers would thus be turned into masses of concrete, enough would be done to make them secure. The success or otherwise of this treatment would be easily shown by the quantity of grout forced into the masonry. With regard to the foundations of the piers, the committee does not consider that underpinning is essential. There has been some settlement of the piers such as would be expected with a clay foundation actually higher than the bed of the river, but it has not been excessive, nor is there apparently any reason to think it is increasing. All that appears to be necessary is to prevent scour around the piers and to prevent the clay foundation from squeezing under their weight into the lower bed of the river. The committee believe that these ends could be gained by driving sheet piling round each of the piers, dredging a trench 5 feet or 6 feet deep across the stream above and below the bridge, and filling with stones large enough to resist the scour of the stream, and then covering the bed between the trenches with similar stones. The bridge so rendered safe for many years to come would be Burns's Auld Brig of Ayr, whereas a new bridge would merely mark the site where the Auld Brig had been.

YORK MINSTER.

THE clerk of the works (Mr. R. C. Green) at York Minster recently reported to the Dean of York on the progress of the restoration at the Minster as follows:—Since your last occasional paper was issued, an addition of 60 feet in height was added to the south-west tower scaffold. The eight pinnacles at the top of the tower were found to be in a very insecure condition. Six of the pinnacles were taken down and renewed. The iron lewis bolts to which the scaffolding rods were attached in the other two pinnacles were cut out and copper lewis bolts substituted. All the iron cramps were also removed and replaced with copper. These pinnacles were completed and the additional scaffold taken down before Christmas. Immediately after Christmas the work on the three lower stages of the scaffold was completed and these stages of scaffold taken down. A scaffold was then erected to the pinnacle over the west gable; the work on this is now proceeding. Although a great deal of work has been done on the lower stages of the scaffold, there still remains a considerable amount to be done before the west front is completed, but I hope to have the greater part of the scaffold removed before the end of the year. The stonework of the west tower was in a very bad condition, caused partly by the increasing smoke which has tended so much to bring about the present rapid decay, partly through the gargoyles and finials having been fixed with iron cramps and dowels instead of copper, or bedded so shallowly in the walls that many were in a very precarious condition, and some had already fallen off at different times. Also during the past century defective stones have been simply veneered over instead of being replaced with sound ones. For instance, note the gargoyle in the string-course under the sill of the belfry window, and also the gargoyles at the springing of the pinnacles. In many cases moulded jambs which, with the exception of one or two badly decayed stones, appeared to be in good condition, have, after the decayed stones were removed, proved to be simply veneer. This not only applies to jambs, but the work generally. The total amount of stone used up to date in the restoration of the south-west tower is 7,128 cubic feet. The weight of this would be about 475 tons; 188 gargoyles and grotesques, 3,030 crockets and 264 finials have been carved. A scaffold is now erected to two buttresses on the north side of the nave and pinnacles, and flying buttresses are now being

pared for these. The old Minster Library is now undergoing repairs. It was found necessary to partially renew the window jambs, mullions, tracery and arches. The necessary repairs to the stonework of the chapter-house windows are completed. The outer glazing is also completed with the exception of the casements.

Mr. Green also reports that he had found embedded in the garden wall of the old residence almost the entire fragments of one of the flying buttresses, namely, seven stones and eleven pieces of coping.

TESSERÆ.

Local Circumstances in Architecture.

If we direct our attention to the venerable remains of Egyptian grandeur we find them, as standing earliest in time, characterised by the greatest degree of simplicity and by the least of what may be called experiment in art. What is the huge pyramidal mountain of stone but the astonishing ideal of simplicity? What is the tall obelisk, the rude compound of the human and bestial forms in the giant Sphinx, but a monument of the same quality? The like may be observed of the Egyptian temple, imposing it was for massive dignity. Again the situation in which, as well as the time when, this style of architecture happened to arise will be found to have imparted to it many of its principles and decorations. Exposed to the beams of a hot sun, the apertures of structures in that country were small compared with the masses placed in a region seldom visited by rain; the temples had no pediments or inclined roofs. The palm-tree and the lotus, rising on all sides, furnished the builders of the day with elegant foliage for the capitals of their columns. The reed from the banks of the Nile, single or grouped, afforded them bands for their entablatures and large hollow cornices—whence, in all probability, the Greeks of after times derived their triglyphs. The bright sun, ever riding over their wide plains, was portrayed above their temple doors as symbolical of the presiding genius of the land, and not unfrequently associated with other celestial deities. The serpent, the crocodile and numerous animals, the objects of their veneration, provided them with additional forms of architectural embellishment. If we further take into consideration the varied observances of sacerdotal mystery by which the disposition of the sacred edifices was regulated, and the different contemporaneous events which frequently conferred a character on the collateral decorations of those edifices, we shall be prepared to allow the great influence of contingent circumstances in constituting the Egyptian style what it was.

Signet Rings.

The Greeks are supposed to have derived the use of the signet ring from Asia. As no mention is made in Homer of rings, Pliney concludes that in those days they were unknown. As with the Egyptians, the primitive use of the ring was to serve as a signet, hence, to prevent fraud, Solon enacted a law that no seal engraver was to keep by him the impression of a ring he had cut; whilst Pythagoras, out of reverence, forbade the images of gods to be worn in rings. In the earlier ages the rings were all of metal, then stones were set in them. The art of gem engraving became in consequence much cultivated, and the Greek engravers arrived at a high degree of perfection in it. No gems certainly known to be of the Pheidian period exist. It is believed that gems were not mounted in rings prior to the sixty-second Olympiad. Alexander the Great appointed Myrgoteles to be his "engraver in ordinary," and alone to execute his portrait in gems, just as Apelles and Lysippus in marble. Greek rings occur of gold, of silver, and of bronze; women wore them of ivory and amber. The Greeks wore their rings generally on the annular or fourth finger of the left hand. The Etruscans were marvellously skilful goldsmiths, in which art their skill has never been surpassed. They had a peculiar method of fusing and joining metals without the use of solder, and this is the secret how to detect Etruscan jewellery in its genuine state. Gem engraving was practised with them at a very early period; it was rude at first, but subsequently of such a nature as to rival that of Greece. The Etruscans rarely worked in cameo. Rings of extraordinary beauty are found in the tombs of Etruria; in fact, they abound, yet seldom do two occur of the same design or pattern. Silver rings are rarer than those of gold; iron and bronze rings are for the most part gilt; specimens of all sorts are to be seen in

museums. The so-called Egypto-Phœnician rings come from the excavations in Sardinia. There is no nation with whose individual and personal history the finger ring is so closely connected as the Roman. At first the Romans wore rings of iron, the gold ring being given to those senators only who were sent abroad as ambassadors; then it was adopted by the senators. Under the Republic and the Empire its use was regulated by laws. The ring of gold was the sign of equestrian rank, and the *jus annuli aurei* became the height of a Roman's ambition. Prætors and quæstors had the right of conferring the *jus annuli*. In later times the privilege was much abused, and in consequence the distinction became depreciated in public estimation. Then the use of rings became immoderate in number and inconvenient in size.

Chiaroscuro in Sculpture.

With respect to the chiaroscuro of sculpture, it is to be considered in two different ways—as the sculpture is a principal or as it is only an agent. Where it is a principal, as in groups and figures in the round, the masses of light and shade, or, in other words, the agreeable or majestic effect of the work in all its possible views, cannot be too much attended to. The taste of lines and harmonious flow of the parts or several members of the work (whether a group or a single figure), their variety and their combined unity, are the efficient causes of that light and shade which give ease and satisfaction to the eye of the spectator, and engage him, as it were, to enter into the contemplation of those still more essential beauties of a higher order which result from the sublime conception of the form and character, and the graceful or pathetic expression of the subject. As to the oppositions of chiaroscuro that are effected by differently coloured marbles, they ought to be rejected altogether. The less the opposition in the colour of the materials, the less offended is the sight. The mixture of bronze with marble in any imitation of natural objects is always displeasing. There are, no doubt, great authorities for the using bronze as the material of statues, and certainly it may, from the weight and sensibleness of its colour, do extremely well, perhaps better than anything else in insulated works which have the air for a background and are to be seen at a distance, as is the case of Falconet's monument of Peter the Great, that of Marcus Aurelius and many others; but in most other cases, in those of enclosed situations, the bronze should be gilded. The light and shade of a gilt figure is no doubt less agreeable than that of a figure in marble, but it is, notwithstanding, much more eligible in confined situations than that of bronze. Sculpture may, in all sepulchral and other such monuments, be considered as a principal or sole object, carrying with it its own laws; and, from the junction of alto and basso-relievo, affords a noble opportunity for those artist-like attentions to the fine effects of composition and chiaroscuro of which it is susceptible in a high degree, and of which some great moderns have given such illustrious specimens as incontrovertibly demonstrate the advantage of the undertaking, whether there had been any ancient examples for it or not. As works of this nature must be regulated by the consideration of the distance at which they are seen, and their aspects respecting the spectator, and also respecting the light, whether they receive it perpendicularly, laterally, or in front, their situation ought always to be previously determined, in order to make these essential circumstances coincide with the just and happy expression of the subject.

A Warning.

SIR,—A few evenings ago, about eight o'clock, a person called to see me. Being too unwell to see anybody, my wife interviewed him. He announced himself as Sir Thomas Drew, son of the late eminent Dublin architect, on whose death he succeeded to the title. I opined at once that he was a swindler, and, as soon as I was able, wrote Sir Thomas Drew, whose courteous reply confirmed my opinion. As this individual is apparently very anxious to get the hall to himself for a few minutes he ought not to be left, except in the company of a policeman. Anxious as he was to see me I have not heard from the gentleman since.

—Yours faithfully,

June 20.

GENERAL.

It has been now practically decided that the marble required for the Victoria Memorial Hall, Calcutta, shall be obtained from Indian quarries.

Sir Thomas Drew, president of the Royal Hibernian Academy, is to receive the honorary degree of Doctor of Laws of the University of Dublin.

The French Commissioner of the recent St. Louis Exhibition has presented a plaster cast of the *Le Penseur*, by M. Rodin, to the Metropolitan Museum, New York.

The Newport Guardians have received communications from various architects submitting terms for preparing a report upon the provision of additional accommodation at the casual ward. Four of the architects volunteered the report gratis, some wanted five guineas and some ten guineas. The question was deferred.

The Loan Collection of examples of process engraving, comprising photogravure, photo-lithography and kindred reproductions by means of photography, which has been on view for the past three months at the Victoria and Albert Museum, South Kensington, will be closed on Sunday, 25th instant.

The Hurricane which occurred in Constantinople on the 11th inst. destroyed a great many houses. The great minaret of S. Sophia was cut in two, and the part which was removed fell on the church of S. Irene.

Mr. Arthur Thompson, who was one of the early members of the new English Art Club, died on the 14th inst. He was an excellent landscape-painter, as well as a writer of articles relating to art.

The Old Library on the south side of the nave of York Minster, which has been in disuse as a library for many years, and in more recent days has served for the storing of the rolls of the Consistory Court and of other ecclesiastical muniments, and as a song school, has been restored, and was reopened on Monday.

The Studentship of 50*l.* offered by the managing committee of the British School of Archæology at Athens, tenable during the session 1905-6, has been awarded to L. J. W. Tillyard, B.A., Caius.

M. Laloux has obtained from the Académie des Beaux-Arts the Prix Berger, of the value of 15,000 francs, for his terminus of the Orleans railway on the Quai d'Orsay, Paris; and the Prix Bailly, of 1,500 francs, has been awarded to M. Ballu for his work on the restoration of the ruins at Timgad.

Sir John Wolfe Barry, F.R.S., has been unanimously elected to succeed the late Mr. James Mansergh, F.R.S., past president of the Institution of Civil Engineers, as chairman of the Engineering Standards Committee, which post Mr. Mansergh had occupied since the formation of the committee in 1901.

M. de la Sizeranne is to deliver a lecture in the Doge's Palace, Venice, on John Ruskin, about whom he has published an interesting book.

The Southampton Record Society has been instituted. The objects of the Society are to print and publish, subject to the consent and approval of the Mayor and Corporation, the more interesting and important of the ancient documents of the borough; to prepare and publish other works, such as books of plans or collections of essays calculated to elucidate the history of Southampton.

A Meeting of the Edinburgh Parish Council was held on Monday, when there were twenty-one applicants for the position of architect to the parish council. Seven were selected for voting, viz. Messrs. A. Lorne Campbell, R. M. Cameron, Grogan Fulton, Henry F. Kerr, William J. Kennedy, Charles Craig and David M'Arthy. In the final vote Mr. Cameron and Mr. M'Arthy, both members of the Town Council, appeared, and both received an equal number of votes. By the chairman's casting vote Mr. Cameron, 53 Great King Street, was elected. The emoluments are a retaining fee of 50*l.*, 3 per cent. on new work and 5 per cent. on alterations.

Raeburn's Portrait of himself, which was bought at the recent Tweedmouth sale for the sum of 4,500 guineas, has now been placed in the Scottish National Gallery, Edinburgh. The work has been placed on a screen in the centre of the third gallery.

The Ceylon Government have resolved to organise a competition for designs for post offices in minor towns.

Mr. George Henderson, of 26 Hermitage Gardens, Edinburgh, a member of the firm of Messrs. Hay & Henderson, architects, of Edinburgh, who died on March 21 last, has left a personal estate in the United Kingdom valued at 1,875*l.*

An Exhibition of the works of the late G. F. Watts, has been arranged for, and will be opened in the Scottish Academy galleries, Edinburgh, in October. James Guthrie, P.R.S.A., Mr. Robert Gibb, R.S.A., and others of the National Gallery, and several Academicians, others have interested themselves in the matter. A greater part of the Watts exhibition now open at Westminster has already been promised on loan.

The Plans prepared for the education committee of the city of Gloucester by Mr. J. Fletcher Trew, M.P. for Gloucester, for new schools to accommodate 700 boys, girls and 400 infants have been passed by the Board of Education.

The Competition for the Radcliffe free library has been adjudged as follows:—First premium, 50*l.*, Mr. H. I. Manchester; second premium, 30*l.*, Mr. Adshead, Manchester; third premium, 20*l.*, Mr. David Bird, Manchester. Forty-nine sets of drawings were submitted to the assessors. Mr. G. H. Willoughby, Manchester.

Mr. Percy Lindley has produced another of his interesting booklets, with illustrations, which is intended to serve as a guide to a series of tours in some of the less known side valleys of the Rhine, easily and inexpensively reached by the Great Eastern Railway Company's routes to Harwich and the Hook of Holland and Antwerp.

The Whitechapel Art Gallery will open on July 14 a Country-in-Town Exhibition. The object is to further movement in favour of garden cities, suburbs and villages by means of models, plans, designs, pictures, &c. An endeavour will be made also to show what has already been done and what might be done in London and other large cities to improve and beautify crowded areas and unattractive districts. The loan of suitable exhibits is sought from the Secretary.

Repairs are about to be undertaken to St. Margaret's Church, Marton, near Gainsborough, which is noteworthy for the Saxon tower erected about the eighth century. The interior of the church includes the various styles up to the sixteenth century. There is some Saxon carving built into the wall, and it is expected that much more Saxon work will be brought to light when the defacing plaster has been removed. The scheme will cost 800*l.*, and will be carried out under the direction of Messrs. Harold Bailey Wood, of London and Newark.

The Driving of the piles which support the vast wooden foundation on which the new Campanile will stand having been completed, the work of surrounding it by a solid wall 10 feet thick, made of large stones from Istria and Muggia is in progress. This wall, from the outward radius, will be graduated in steps to the top, so that at the level of the piazza it will correspond with the size of the original Campanile, which it is supposed will rise from there nearly to the spring.

People whose æsthetic tastes will not allow them to wholly approve of the plans for the Liverpool Cathedral says the *Liverpool Courier*, will welcome the announcement that a model of the proposed edifice is being prepared. The pictorial representations of the prospective mother church of the diocese have been quite faithful, but from a model a much better idea of the building can be gathered. The model which will shortly be placed on public view will be a perfect miniature representation of the cathedral and will contain all the fine detail which will add grace to the massive edifice. An expert suggests that too severe a criticism upon the design for the new cathedral should not be passed until the model has been seen.

The New Façade of the Naples Cathedral, which has cost some 260,000*l.*, has been inaugurated; a further sum of about 16,000*l.* will require to be expended on the towers of the building.

Orders have been issued to troops of all kinds in the London district to adhere strictly to the decision of the London County Council that, owing to the defective condition of Lambeth Bridge, no vehicle exceeding 2½ tons in weight is to pass over it, that no traffic shall proceed at more than a walking pace and that large bodies of people of any kind shall not be allowed to congregate on or to cross the bridge. It is considered that the bridge is incapable of bearing the strain of troops on the march.

The Architect.

THE WEEK.

WE referred last week to the difficulties which sometimes arise in the selection of building stone. Another instance has lately occurred in Dublin. According to a pamphlet by Mr. WILLIAM BUTLER, architect, the external jambs, arches, mullions, strings, &c., in Christ Church Cathedral, Dublin, which the late Mr. STREET had specified to be executed in Caen stone, are decaying. The photographs show that the surfaces of the masonry courses vanish in large flakes, while some of the capitals may be said to have lost their ornamental character. The atmosphere of Dublin is more favourable to stone than that of London, and the material employed must have been exceedingly defective. Mr. STREET supposed that some stone which he found in the cathedral, and which had endured the wear and tear of centuries, was from Caen. Some Dublin masons told him it was not, and that Caen stone was not adapted for external use in Ireland. Mr. BUTLER declares that "if anyone wishes for a proof of the error in Mr. STREET's judgment, let him go to the west door and look at the band of old stone found by him, which is to be seen alongside the Caen stone, and observe how the former is absolutely uninjured by the weather, whilst the latter is crumbling away. It is possible that if STREET had lived he should have had to replace this decayed work with proper stone, at his own expense, in order to save his name." The moral to be drawn from the failure is that the eye is not always to be trusted, and that some kind of analysis or microscopic examination is desirable, in the case of monumental works especially. The defects, which we hope will only be partial, may be said to have a pathetic interest. The church was restored at the expense of Mr. HENRY ROE, who in undertaking so colossal a work had over-estimated the extent of his fortune. It is sad to think that the historic building he sought to preserve seems doomed to an early decay.

AN effort was made at the last meeting of the Sheffield education committee to obtain a more generous treatment of architects. Owing to competition and eagerness to obtain commissions the fees paid at present amount to no more than $2\frac{5}{8}$ per cent. of the contract amount, whilst in other places the lowest rate is 4 per cent. It was therefore proposed that the rate of remuneration should be referred back for further consideration, and one of the members said that he could not understand why a sweating system should be adopted in dealing with architects while standard prices prevailed with workmen. To this it was replied that there was no standard rate recognised by architects. That unfortunately cannot be denied, for the general tendency now is to go as far below the 5 per cent. standard as possible, and never to allow that rate to be exceeded. It was further argued that school buildings were repetitions. It was pointed out in support of the reduced rate that formerly the Sheffield architects received 5 per cent. commission, and it was their interest to increase the cost of the works. Now the arrangement was to calculate the commission according to the number of children accommodated. Originally the sum was 6s. a head, now it is 7s. 6d. Economy is an influential force, and as architects have few friends it is easy to make them appear as its enemies. In Sheffield they must therefore be satisfied with a 7s. 6d. rate, although it will bring in no more than a $2\frac{5}{8}$ per cent. commission.

THE first Church History Exhibition was opened in the town hall, St. Albans, by the Bishop of the diocese on Tuesday. It will close on July 15. Several lectures will be given, including three on the history of the abbey of St. Albans and on Gothic architecture.

The Archbishop of CANTERBURY has lent some manuscripts from the Lambeth Library. They comprise:—

1. *Service Book with Music*, supposed to have been written for St. Albans Abbey (large folio). Dr. FAIRFAX, organist of St. Albans, is said to have written the music (fourteenth century).
2. *Wycliff's Bible*.
3. *Missal* belonging to Archbishop CHICHELE (early fifteenth century), with initials, miniatures (with sacred history), and many scroll ornaments of the letters, with the arms of CHICHELE.
4. *A Psalter* of Flemish school (fifteenth century). The calendar to this manuscript has beautiful marginal ornaments in filigree work of blue and gold.
5. *A Psalter* (fourteenth century, on vellum), with a superb initial letter "B," in which is painted the "Jesse tree" and seventeen medallion pictures. The backgrounds of many of the illuminations are of burnished gold, with tessellated or mosaic-work architecturally treated.
6. *A Processionale*.
7. *A Book of Hours of the B.V.M.* (illuminated). All these manuscripts are fully described in the "Art Treasures, Lambeth Library," by Mr. S. W. KERSHAW, F.S.A.

GREEK archæology, which in many countries is studied with enthusiasm, owes much to Professor ADOLF MICHAELIS, of Strasburg University. He is one of the men who upholds the greatness of Germany, and his seventieth birthday, which fell on Thursday of last week, was celebrated with cordiality. His book on the Parthenon may be considered a classic. He is on the side of those who maintain that the scenes represented by the Elgin Marbles relate to the Panathenaic Procession rather than to the preparations for that ceremony. Like other able men in Germany, Professor MICHAELIS belongs to a family of teachers. At the time of his birth his father was professor in Kiel. From the first his studies were directed towards archæology, and with that object he spent years in close study in Italy, Greece, England and France. It was not until 1862 that he accepted the post of supplementary professor of archæology. Three years afterwards he became ordinary professor in Tübingen, and in 1872 he was advanced to Strasburg, where, in spite of all temptations by other universities, he has remained. With Professor MICHAELIS archæology is made to include ancient languages, for he believes that there was a close connection between art and literature, although each followed its own course.

THE experiment of the Guildford Town Council in cottage building will be watched with interest, for it relates to one of the necessities of our time. In so large a town it might be supposed speculators would be willing to provide accommodation. It may perhaps have been with the intention of inviting enterprise that it was proposed to borrow 15,000*l.* in order to erect fifty-six cottages and provide roads and sewers. Afterwards the scheme was reduced, and the loan desired will only be for 4,441*l.* for the erection of eighteen cottages. Plans were sought from three local firms, viz. Messrs. CLEMENCE & MOON, Mr. A. J. STURGES and Mr. T. J. CAPP; the borough engineer also sent a plan. The last was estimated to cost 258*l.* per cottage, while Mr. CAPP's was only 175*l.* The other competitors' cottages would cost 190*l.* and 195*l.* respectively. The cubic rate for the borough engineer's cottage was $7\frac{1}{2}$ *d.* and for the others 6*d.*, the difference arising from the quality of the materials used. The committee decided that a terrace of ten cottages should be erected from Mr. CAPP's design, but the frontage is to be 16 feet instead of 15 feet, and the front elevation below rough-cast to be of red bricks instead of stock. In that way 5*l.* 10*s.* will be added to the cost of each, making the total 183*l.* The architect's fees in addition to the 20*l.* premium are not to exceed 50*l.* Two blocks, each of four cottages, are to be erected from the borough engineer's plans, at a cost of 230*l.* The work is to be carried out by local builders if their tenders are reasonable.

THE FLORENTINE BAPTISTERY.

IT is usual in histories of architecture to connect the Baptistery of St. John at Florence with a Queen of the Lombards. Mr. FERGUSON, while adopting the belief, expresses some doubts about its accuracy. According to him the Baptistery "was originally the cathedral of the city, and was erected to serve as such apparently in the time of THEODELINDA, queen of the Lombards. If this was so, it certainly had not originally its present form, and most likely those columns which now stand ranged round the walls at that time stood in the centre, as in the Roman examples. If the original roof was of wood, it was probably in two storeys, like that of the Baptistery of CONSTANTINE, or it may have been a dome of more solid materials, like that of Sta Costanza." THEODELINDA is a somewhat mythic personage, and BOCCACCIO was not afraid to introduce her into one of his novels. She lived in the sixth century, when Florence, like other Italian cities, contained ruins which were spoils for builders. It is said there is still a stone in the Baptistery, although few visitors have seen it, which bears the name of AURELIUS VARUS, the Governor of the Florentine district. Many scholars have believed there was no rebuilding by THEODELINDA, for the Baptistery retains in plan at least the form of an octagonal temple, which might have been dedicated to MARS. The President DE BROSSES, who visited Florence in 1739, describes the building as "an ancient Temple of Mars of an octagonal form, which was metamorphosed into a baptistery contrary to the intention of those who founded it." It is hardly necessary to say that in the days of Imperial Rome MARS was regarded as the protector of Florence. At one time it was imagined that the civil and other wars arose from abandoning MARS and adopting St. JOHN THE BAPTIST as his substitute. DANTE, the poet, makes JACOPO OF ST. ANDREA announce himself as a Florentine by saying:—

I of that city was which to the Baptist
Changed its first patron, wherefore he for this
For ever with his art will make it sad.

DANTE seems to have had more affection for the Baptistery than for any of the other Florentine buildings. In one of the cantos of the "Inferno" he describes the holes in the rock which contained men who, like Lord BACON afterwards, for money delivered unjust judgments, and those who practised simony. He says:—

To me less ample seemed they not, nor greater
Than those that in my beautiful Saint John
Are fashioned for the place of the baptisters,
And one of which, not many years ago,
I broke for someone, who was drowning in it;
Be this a seal all men to undeceive.

The words are plain enough, and are intended as a rebuke to the enemies of DANTE, who charged him with the crime of breaking a font in a church which all Florentines were bound to reverence. LAMI, whom some accept as a great authority on the ancient city of Florence, interprets the lines as meaning that DANTE fell into one of the basins of water which surrounded the principal font and nearly lost his life. They used to point out one of the flags of the pavement and say it was there DANTE brought his stool whenever he wished to meditate. It may have been on one of those occasions that he was able to rescue the youth who, we suppose, was cooling his hands by dabbling in the water and overbalanced himself.

Did DANTE's thoughts, while he was seated, ever endeavour to create a history of the edifice? He was an admirer of the ancient Romans, and after his banishment from Florence he must have seen many of their ruined buildings. But when he sat in "mio bel San Giovanni" he probably was unable to realise the analogy between the building and some of those circular structures with which the Romans were fascinated. DANTE must have been acquainted with San Giovanni before ARNOLFO altered it. That architect removed various arches as well as tombs which surrounded the exterior, and

he cased the eight walls with black marble. Simple as the operations may appear when briefly noticed by VASARI, it is possible that much was sacrificed which was expressive of the original character of the edifice. GORI supposes that the building was erected in A.D. 430. But when we go back so far there is little difficulty in making an additional step and reaching the period when Romans rather than Lombards were the rulers of the floral district through which the Arno runs. As late as DANTE's time San Giovanni served as a cathedral. There was a new spirit in Italy through which Paganism ceased to appear as only an abomination, and the bishops would be more anxious than their predecessors to remove all features which were distinctly suggestive of pre-Christian ideas. For it is remarkable that almost simultaneously ARNOLFO altered or purified the Baptistery and prepared plans for a cathedral in Florence which was to be one of the wonders of the world.

The beautiful doors are now the chief attraction to most visitors, or, rather, the two by Ghiberti, which Michel Angelo considered were worthy of Paradise. Originally there was only one door to the Baptistery. When the single altar was removed in order that Ghiberti's gates might be inserted, it may have been feared that many other changes were to follow, but in subsequent years the building was untouched. The arrangement for baptisms was of a different kind to what is now seen in modern churches. The basins were of capacity to contain sufficient water to drown a youth. Provision was evidently made for the christening of others besides infants. It is impossible to determine the materials which were used for fonts, or how it was that DANTE was able by his unaided strength to break a basin and rescue a youth who was in danger. There can be no evidence on the subject, since one of the fonts which was supposed to be the most important centre of a group was destroyed by a prince of the Medicis in 1577. New arrangements were afterwards made, and the building still continues to be used for baptisms. Since the fifteenth century a register of the young Christians has been kept, and statisticians should know it was the earliest attempt of the kind in Europe. At first there was much opposition to so novel a record.

It is not to be supposed that the people of Florence became indifferent to the Baptistery when it ceased to be used for cathedral purposes. In 1506 a commission was given to GIOVANNI RUSTICI for the figures in bronze of St. JOHN THE BAPTIST, the Levite and the Pharisee. RUSTICI was a friend of LEONARDO DA VINCI, and it was believed by VASARI that the great master worked on the models. The figure of the Precursor has qualities which recall LEONARDO, and the contrast between the two flanking figures is worthy of him. The *Execution of John the Baptist*, which is the companion work, consisting of a central figure between columns, with the *Executioner and Salome*, is the work of VINCENZO DANTI. A third group by ANDREA SANSOVINO represents the Baptism of CHRIST. The silver altar was produced by sculptors or silversmiths, but it is noteworthy as suggesting that congruity was not always recognised, for the style of that costly example of metalwork comes nearer to Gothic than to Renaissance. For many amateurs the most important incident in the annals of the Baptistery is the competition for the gates. ANDREA PISANO had completed the southern gate, which alone was required in 1330, for, as we have said, there was only a single entrance to the building. The work was considered a marvel, and DANTE would have rejoiced if he could have seen such an adornment of his favourite building. When completed the work was received by Florence with as much delight as was shown towards CIMABUE's *Madonna*. Some seventy years afterwards the memorable competition was arranged for designs for the northern and eastern gates. Ghiberti, as is well known, succeeded, and his scenes, from Bible history, which are in remarkably high relief, receives greater attention from visitors than the building itself. It must

is admitted that the exterior of the Baptistery does not possess much architectural merit. ARNOLFO no doubt is responsible for the veneering of marbles, in which squares and oblongs preponderate. Ghiberti's gates appear to have more massiveness than the upper part of the structure.

The Baptistery will always have interest on account of the association with it of DANTE and many of the greatest sculptors and painters of Italy. But the archaeologist must continue to wish for information respecting the origin of the building. We know that in primitive days a division was made between worshippers, and there was secrecy not only about many of the dogmas of Christianity, but strangers were not allowed to be present at services. Hence it was that, where the opportunity offered, a supplementary building was used as a baptistery. The word is older than our era, for the "baptisterium" was a part of the Roman baths. However, a baptistery without a cathedral or a church, as was the case in Florence, is not easily understood. At a later period a round or octagonal church could be supposed to be an imitation of the Holy Sepulchre, like some of the English Mediæval churches. That stage was not reached when the Florentine Baptistery was erected. The building is therefore somewhat of a mystery, and there are no archives to aid in removing the obscurity of its early history.

THE CATHEDRAL OF ST. ASAPH.*

THE illustrations in this week's *Architect* complete the series devoted to the cathedral of St. Asaph. We pointed out in January last that ASA or ASAPH was head of the monastery and bishop of the district. It is not improbable he was one of the men ruled by St. KENTIGERN OF GLASGOW, who was the true founder of the see. The district was remote from either Winchester, York or Canterbury, and the history of the see during more than a thousand years was unknown to the majority of English ecclesiastics. There may have been records, but they were likely to have been interrupted during the conflicts between the Welsh and the English nations. It is, therefore, impossible to say with certainty whether there was a formal dedication of the church to St. ASAPH. In 1282 the Bishop was ANIAN II., who when a monk had accompanied EDWARD I. in one of the Crusades. He was appointed to the see in 1268. The whole region was in a state of tumult, for LLEWELLYN, though a vassal, to EDWARD, was eager to make Wales independent; and Bishop ANIAN was charged with aiding and abetting his efforts. It was, however, impossible to prove overt acts of treason. The Bishop was pardoned and allowed to undertake the erection of a cathedral which is supposed to correspond with a large part of the existing building. He died in 1292, and an old effigy of a bishop is presumed to represent him. His successor was LEOLINE DE BROMFIELD. A cathedral in those days needed a singing choir as an essential aid to the services. Bishop DE BROMFIELD, having obtained the approval of the Dean and Chapter, ordained that all the vicars choral who shared in the revenues arising from the benefice of Godelwern, in Merioneth, should alternately be present in the cathedral at all canonical hours and should chant the service (*cum notâ*) in regular course, according to the direction of the precentor. The dean and prebendaries of Vaynol and Llanufydd should provide three priests, being good singers and experts in the science of music, to assist the vicars choral at the time of Divine service, and that the archdeacon should send a person skilled in singing and organ-playing. The prebendaries of Alt Meliden and Llanvar were required by the same authority to furnish four boys, being good singers, as choristers for the daily celebration of Divine service. The arrangements continued until the close of the

seventeenth century, for the choir was upheld by the cathedral staff. "If they had not been gentlemen of generosity and zeal," according to BROWNE WILLIS, "the church must have lain in ruins, and inferior members could not have subsisted." These facts are interesting as evidence of a desire to uphold the efficiency of the cathedral, although it was only small in size, and stood in a district which might not be regarded as favourable to ecclesiasticism. One bishop sought to increase the revenue by a weekly market at St. Asaph; an annual fair was held with a similar object. The quarries from which stone was obtained for the cathedral were let out at a rent. The funds were always limited owing to local disturbances and the peculiar position of the diocese, which could be considered as English or Welsh according as an objector was disposed. The prelates who ruled over the see have sometimes Welsh names, but the majority of them must have been Englishmen. One of the latter, Bishop THOMAS GOLDWELL, is supposed to have taken part in the deliberations of the Council of Trent and was the only English prelate present.

Among the post-Reformation bishops was JOHN OWEN, who was elected in 1629. He seems to have been an innovator, for he destroyed the throne which RICHARD REDMAN had set up at the close of the fifteenth century. But he introduced one of a different design for himself; he provided seats and forms and erected a large organ. He was doomed to suffer during the Civil War. He was not only imprisoned and fined, but his lands were sold. The palace became a beer-shop, calves were penned in the choir, horses and oxen in the nave, and the font was converted into a trough. GEORGE GRIFFITH, who succeeded in 1660, must have experienced difficulty in cleansing and restoring the building. ISAAC BARROW was another eminent cleric, and WILLIAM LLOYD, who followed him, was one of the seven bishops charged with conspiring against the Government, whose trial led to the flight of King JAMES. MACAULAY describes him as "a pious, honest and learned man, but of slender judgment, and half-crazed by his persevering endeavours to extract from the Book of Daniel some information about the Pope and the King of France." He was one of the very few bishops who assisted at the coronation of WILLIAM III. WILLIAM FLEETWOOD paved a part of the cathedral and spent about 100*l.* in painting and adorning the choir. There was a storm in 1714, when the upper part of the tower fell into the choir, and the reparations were carried out at the expense of Bishop WYNNE. During the eighteenth century there were restorations which were still more fatal, and one of the ancient builders could not recognise the structure under the coating of stucco which LOUIS WYATT considered to be the best way of concealing the defects of the Gothic builders.

About 1850 the cathedral was visited by an archaeologist, and his remarks will suggest the characterless aspect of the building, which was produced by all the most important features being hidden beneath the respectable covering of cement. He says its great peculiarity is that it has no peculiarity about it. It is more uniformly built than English cathedrals in general; any further comparison only serves to point out its defects. We look in vain for some of the most beautiful features of the cathedral church—the lady chapel, the cloisters, the chapter-house and even the monuments. RICKMAN describes it as a plain cross church, principally in the Decorated style; and it certainly is a singular example of what appears a paradox, viz. Plain Decorated. We have only two dates to keep in mind—1284, when the walls and pillars now remaining were erected, at which time (EDWARD I.) the Decorated style had just been introduced, and 1490, when Bishop REDMAN put in the east window and raised the walls to the height at which they now stand; and then the Perpendicular had fully developed its distinctive features. A close examination supplies a proof of the fact of the different periods of building, for the upper part of the nave is not of the same workmanship as the lower;

* See Illustrations.

and while most of the church is built of a red soft stone, the east window is of white freestone; while the windows of the nave and transepts are Decorated, the five in the clerestory show that they owe their shape to the times of the Tudors. Among the beautifyings of modern times the clerestory has entirely disappeared from the inside. The ceiling is plain in the worst sense of the word, consisting, as it does, of plaster vaulting, with a few lines here and there to represent tracery. In the nave this style of roof has only lately succeeded a timber one of unornamented beams and rafters. The tower rests on four Pointed arches, in the western of which is the screen and organ. The transepts are blocked up to serve the purposes (north) of chapter-house, vestry and (south) of library. The choir is mainly "a modern re-edification, with much attempt at the imitation of ancient work, but with no real resemblance to any style, though the intention seems to have been the imitation of Perpendicular." The canopies of the stalls alone remain to attest the short-lived beauty of the original choir.

A building in that condition was not easy to restore. The mere removal of the stucco was insufficient. From the time of the Civil War the edifice had been subjected to much vandalism, and partial attempts at restoration would leave it still a ruin. The illustrations we have given reveal how skilful was Sir GILBERT SCOTT's treatment, especially if we compare the illustrations of the cathedral which appeared prior to its restoration. The principal window was flanked by a pair of hideous monuments, and indeed all parts of the sanctuary were mean. The pews extended almost to the altar-railings, and the pavement was broken. The nave and its aisles, said one writer, are plain almost to meanness. The columns are without capitals; instead of vaulting there are beams and rafters. Beneath the tower was plaster vaulting, and here and there were ribs and keystones without corresponding groining. In fact, the cathedral was not worthy of its name, whilst now it suggests not only its purposes, but the style which was favoured when Bishop ANIAN ruled the see.

HOLYROOD PALACE AND OLD PARLIAMENT HALL.

BY command of the King certain new arrangements are to be brought into operation connected with the admission of the public to the historical apartments at Holyrood, the objects of which are the better preservation of the rooms and furnishings, and the comfort of the many visitors who, in increasing numbers, make a pilgrimage to the ancient Palace. These involve, says the *Scotsman*, the employment of an increased staff of warders and cleaners, and it is in contemplation to attempt to regulate the circulation of visitors in the Palace, as is done in other places of the same kind, by taking them round the apartments in groups. This will tend to the better preservation of order and more efficient watching than is possible at present. It is interesting to note that on the Glasgow Spring holiday this year no fewer than 5,000 people visited Holyrood, and it is no uncommon thing during the summer season for 1,000 to 1,500 visitors to pass through the Palace on an ordinary day. So great an influx of visitors has rendered it necessary to consider the closing of the Palace one day a week for cleaning purposes, but the day of the week on which that will be done has not yet been decided. The day selected will be that which will inconvenience the fewest number of visitors. The new warders are all to be old soldiers, pensioners, in uniform. They will be under the care of a warder-sergeant, who will be placed in charge of the arrangements connected with the admission of the public to this part of the Palace. It has been also arranged by the Board of Works that photographs and guide-books of the Palace will only be sold in future at the porter's entrance gate. This will enable the warders in the historic apartments to give their undivided time and attention to visitors. It may further be noted that for several years past a number of skilled needlewomen have been employed in restoring the interesting and valuable tapestries with which the walls of several of

the historic apartments, notably the Queen Mary suite, are hung. The results of their labours are now seen in the improved state of the tapestries, some of which had been allowed to get into a serious state of disrepair.

During the approaching summer vacation a number of renovations of an interesting character are to take place under the direction of the officials of the Board of Works on the old Parliament Hall, now included within the suite of buildings dedicated to the Court of Session. A completely new floor is to be laid. The old floor, which is but no means the original floor of the hall, is at present very much worn. It will be replaced by a strong parquetry floor of oak and teak an inch in thickness, arranged in large panels, teak and oak alternating, with a teak border with coloured band. The elaborate open oak roof, the original roof of the hall, is to be cleaned. At present the colour of the oak of which it is composed is hidden under many coats of a reddish varnish. This is to be entirely cleaned off so as to disclose the fine old tone of the oak itself. The walls are also to be redecorated. Mr. Oldrieve, architect, H.M. Board of Works, is at present in consultation with Sir James Guthrie, P.R.S.A., as to the colour to be selected with which to paint the walls so as to set off to the best advantage the many fine pictures and statues with which the old Parliament Hall is adorned. The idea is to treat the wall in a flat colour which would give something of the effect of an old stone wall. The fine stained-glass picture window at one end of the hall, some parts of which have been fading, is also to be put right, the whole operations involving the expenditure of a considerable sum of money which has been voted for the purpose. The Society of Advocates is, it is understood, to take advantage of the pictures being taken down from the walls to have some of them cleaned and preserved—a delicate work for the superintendence of which they have been fortunate to secure the President of the Royal Scottish Academy.

NORTHANTS ARCHITECTURAL SOCIETY.

THE annual excursion of the Architectural and Archaeological Society for the archdeaconries of Northampton and Oakham commenced at Leighton Buzzard. The church of All Saints, Leighton, was first inspected. It is a fine building, with a massive tower and octagonal spire which are Early English, other portions of the fabric being in the Decorated and Perpendicular styles. Mr. Robert Richmond, who has made a careful study of the church, gave a short sketch of its history. From this we gather that the first record of any church at Leighton occurs in Domesday Book, where it is one of the three churches mentioned in Bedfordshire. In 1288 Nicholas de Heigham, prebend of Leighton, is stated to have left sufficient money to finish the building, the present tower and spire being the result. The ironwork on the west door was probably made by John of Leighton, as it is similar to the grille round Queen Eleanor's tomb in Westminster Abbey, which was also his work. This ironwork was removed to the end of the south transept in 1842, but replaced in its original position in 1886. At the restoration an ancient altar-piece was found hidden beneath the plaster, with enough of the original colour remaining to enable it to be renovated. The fine oak stalls in the choir, with their misereres, were much admired. The date of these is uncertain, but is stated to be not later than 1390. Probably they were not made for this church. Other features of interest are the carved Jacobean altar-rails and table. The church contains many monuments to the Leigh family.

After viewing an interesting Renaissance doorway, the history of which is unknown, the party looked at the ancient market-cross, which stands in the market-place. This reminds one somewhat of the better known Eleanor's Cross at Northampton, but its date is much later, probably about 1380. It was restored in 1850, when the original figures were taken down and set up at the adjoining market hall. They have since been replaced, and the newer figures now stand on pedestals round the hall.

Permission had been obtained to view the grounds which surround the stately mansion, Mentmore Towers, and command a magnificent view of the Chilterns. The gardens are laid out in the Italian style, and contain some fine examples of bronze statuary. The vicar (the Rev. F. H. Tatham) described the principal features of the church, and compared it with Brixworth, to which it bears a striking resemblance;

it was built probably under the influence of Augustine, in the Basilican style. The roof is of the fifteenth-century, and is elaborately carved; but the most noteworthy thing about the fabric is the Saxon apsidal chancel, with crypt beneath. The chapel of St. Catherine has been lately restored to the memory of a late parishioner, Mr. Charles Coates. The base of an ancient Norman font is to be seen in the porch. There are some elaborate monuments to the Dorman family, with recumbent effigies of Sir Wm. and Lady Dorman, in the choir, embellished by a fine display of heraldry. Although dating from 1590, they are in a well-preserved condition. At Stewkley another halt was made to inspect the church of St. Michael, one of the most beautiful and complete specimens of Norman architecture existing in England. It was built about 1150. Later the church was made over to the priory of Kenilworth, and the fabric was restored in 1862. The vicar (the Rev. R. B. Dixon) explained that the beauties of the church were rather lost on the villagers, as most of them were Dissenters.

Eaton Bray Church has recently been restored in a very conservative and excellent manner. The northern arcade of this building is of Early English workmanship, the foliage of the capitals and the clustered piers and mouldings of the arches being of great beauty. At the east end of the south aisle is a unique and charming window, combined with a reredos in the Perpendicular style. On the south door there is some rich ironwork by the same smith who hammered the hinges on the west door at Leighton Buzzard. The church at Totternhoe is late in style, being of the Tudor time; the roof, however, is of very good design and workmanship. With the exception of one small brass, the church is quite void of monuments. From thence back to the celebrated earthworks of Totternhoe Castle, situate on the brow of the chalk cliff, with its dry moat and keep. The old camp, known as Maiden Bower, which lies on the British road, which crosses the Ickneild Way, and the priory church at Dunstable were also included in the programme of the second day.

GREEK TEMPLES.

IN the *Architectural Record* for June (New York Architectural Record Co.) is an interesting article "The Greek Temple," by Mr. Jean Schopper, which is illustrated by photographs and reproductions of some of the drawings in the Ecole des Beaux-Arts. The following is one of the passages:—

In constructing their stone edifices, the Greeks, who were reasoners and logicians, followed certain rules, and adopted for each edifice a certain fixed proportion. What does this mean? It means that the proportions of the different parts of the edifice are simple proportions which can be reduced to a common measure. Take as an example the Temple of Pæstum, with which we are now dealing. The module is the mean radius of the column. This module measures 3 feet. The column is ten times the module, or say 30 feet. The distance between the axes of the columns is five times the module, say 15 feet. The total height of the entablature is also 15 feet, the width of the abacus is three modules, equal to 9 feet. It is thus seen that all these numbers are multiples of three, which is the module. In this manner the proportions of the different members of an edifice have a constant relation to each other.

It goes without saying that the module varies for each edifice; there is no single and absolute rule. For instance, in the Doric order the length of the column varies from ten to twelve modules; in the Ionic order from sixteen to twenty-one. The entablature of the Doric order measures five modules, and that of the Ionic only four.

Once these proportions were determined, the Greeks did not trust to calculation alone as regards the different parts of their building. They knew that an edifice was not an abstract thing, but a mass of stone surrounded by air and light, and that, after having studied the proportions on the plan, it was necessary to study the architectural forms in the light of day. That seems very simple, but it is not. We shall see to what a high degree of refinement the Greeks carried this concrete and realistic study of an edifice enveloped by a certain atmosphere. Every scholar is familiar with what we are going to summarise here; but architects, who ought to apply these methods, are ignorant of them. They still believe that the sky and light of Attica are the same as those of Paris, London and New York. This is a grave error. Who are the architects of our day that trouble

about these questions? So-called Greek and Roman edifices are built in London and Paris, and what an aspect is presented by those noble colonnades, coated with soot, under our fog-laden skies. In the United States the light is quite different from what it is in Western Europe; it has the clearness, strength and freedom from half-tints, characterising the light in Greece and southern Italy. Consequently the forms found by the Greeks are more in their native atmosphere in North America than in France, England, or Germany. It is true that they do not correspond to present needs, but that is another question; we are speaking now of light and atmosphere.

The Greeks observed that a smooth column melted in the light and that its lines were vague and uncertain. In order to restore its definiteness they conceived the idea of fluting it. The sharp ridges of the fluting, catching the light, contrasted with the dark hollows, thus giving body to the column and emphasising the vertical outline of the edifice; whence a double advantage. This discovery could never have been made on paper.

Then, as the abacus of the capital casts a shadow upon the top of the column, the junction of capital and column becomes indistinct. To restore the necessary effect, the Greek cuts several deep lines at the point of junction, and to emphasise them he paints them in a dark tone. Even the curve of the circular torus carrying the abacus is so designed that the bright light, striking upon the relief, shall fade into a shaded half-tint towards the hollow. Thus, as Viollet le Duc truly says, the Greek preserves, even in appearance, the forms which his reason tells him to adopt as being the best and most enduring.

"Even in appearance." This leads us to the subject of optical illusions, and we shall here see still more clearly that the Greek never let himself be guided by mathematical considerations, but observed and experimented directly upon the things themselves. He relied upon his senses, and especially his eyes, for the pleasure of which organs, in the long run, all things are intended. He thus noticed that cylindrical columns, when "dressed," appeared to be strangled in the middle. He therefore drew the lines of the shaft outwards. In the same way, the columns appear thicker or slighter according to whether they stand out against the sky or against the *cella* wall, painted in dark red. The open air "eats" away the corner column; therefore, the Greek makes this column thicker than the inner ones of the front.

Again, the Greek diminishes the interval separating this column from its neighbours, because the eye requires a force at the corner of the edifice.

The Greek observes that the vertical columns appear to incline towards the void; thereupon he corrects the seeming fault by making them lean a little towards the interior of the building.

Similarly, the fronton is not vertical, but inclined outwards, for the reason that if it was vertical it would appear to retreat.

The horizontal lines of edifices—all our edifices—appear to bend in the middle and turn their concavity upwards. The Greeks, guided as they always were by the experience of the eye, followed their usual method by deforming the horizontal lines either of the architraves or of the pavements upon which the colonnades rested. These curves are very slight. In the 330 feet of lateral frontage of the Parthenon the deflection required is only about four inches.

In short, the subtle Greeks, avoiding a slavish adherence to strict modularity and mathematical proportions, deformed their edifices in order that they should appear symmetrical to the spectator. Thus, as the high parts of an edifice are seen foreshortened by anyone standing on the ground, it is necessary to increase their dimensions so that they shall appear in harmony with the lower parts. And this is what the Greeks did, not only in the case of frontons, but also of statues which were to be viewed from below.

It must be confessed that we moderns have not had the wisdom to profit by the valuable lessons and remarkable experiences of the ancient Greeks. We have copied clumsily, more like children than like artists. We have adhered to the letter that kills rather than the spirit that quickens—and we have not even done that much with any precision. What contemporary architect takes account of the laws of optical distortions, although they are explained at length in many text-books? All modern architects ignore them. Judge, then, how far they are from discovering such things. The admirable Parthenon friezes in the British Museum have been placed on view at the height of a man; likewise the fronton figures; yet Phidias and his

assistants knew they were to be placed at a considerable height, which would oblige the person looking at them to gaze upwards, and treated them accordingly.

When one reflects upon these facts, which at first sight seem unimportant, one is led to the conclusion that our boasted art-culture is perhaps after all only a vulgar make-believe compared with the true art created by the ancient Greeks; and that we too deserve the name applied by them to those who were not of themselves: "Barbaroi."

ARCHITECT'S FEES IN THE TRANSVAAL.

In the Rand High Court before Mr. Justice Wessels, an action was brought by Mr. John Beauchamp Nicholson, a Johannesburg architect, on May 24, against Alexander Algernon Osborne, a speculator, of Bell's Buildings, Main Street, Johannesburg.

The action was for the payment of 790*l.* 10*s.*, being the balance of an account for professional services rendered and work done in the preparation of sketches, plans and specifications for the defendant.

In his declaration plaintiff stated that about January 1899 defendant instructed him to design and prepare sketches for a building to be erected at the corner of Joubert and Jeppe Streets, Johannesburg. Later, in March 1902, defendant further instructed plaintiff to prepare plans and specifications in respect of the said building. The amount of the remuneration to be paid for the work was not agreed upon between the parties. About four months later plaintiff completed the work and delivered copies of the plans to the defendant in September. The defendant subsequently approved of the plans and specifications. Plaintiff claimed that he was entitled to a fair and reasonable remuneration at the rate of 2½ per cent. on the estimated cost of 49,000*l.* of the building, viz. to the amount of 1,225*l.* In October 1902, at defendant's request, plaintiff prepared and delivered to him blue prints and photographs in connection with the building, and reasonable remuneration for this work was 15*l.* 15*s.* Defendant had not proceeded with the erection of a building, but had from time to time paid plaintiff several sums on account of his indebtedness, but an amount of 790*l.* 10*s.* was still owing.

In his plea the defendant said that about March 1902 he instructed plaintiff to design and prepare plans and specifications for the building of an hotel, which defendant intended to endeavour to float into a company, and it was then agreed by the parties that unless the flotation of the company or erection of the building were proceeded with plaintiff could only claim and be entitled to out-of-pocket expenses. About September 1902 he paid plaintiff 300*l.*, which plaintiff accepted as being in full settlement for the work done, it being understood and agreed between the parties that plaintiff would be entitled to no further fees unless the hotel building scheme was floated or the erection of the hotel building proceeded with. He had not been able to float the hotel into a company or proceed with the building, and plaintiff's right to any further fees had not yet accrued.

In reconvention, Mr. Osborne claimed from Mr. Nicholson 150*l.*, the amount of a cheque which, it was alleged, was dishonoured.

In his replication, Mr. Nicholson said that the plaintiff in reconvention gave him a promissory note for 150*l.* on October 18, 1904, on account of his indebtedness for plans and specifications. The note was payable on November 18, but it was agreed between the parties that, as a guarantee that Mr. Nicholson would not press Mr. Osborne for the payment of the promissory note on the due date, he should give Mr. Osborne a post-dated cheque, payable on the same date for the like amount. Mr. Nicholson had not received any value for the cheque now sued on by Mr. Osborne, and it did not represent any indebtedness by Mr. Nicholson to Mr. Osborne, and he did not owe Mr. Osborne the said amount or any part thereof.

Mr. Nicholson, in his evidence, corroborated what was set forth in the petition, and in answer to counsel said that when he asked Mr. Osborne for more money Mr. Osborne said it was not convenient to pay him just then, but he gave him a promissory note for 300*l.*, which the bank reduced to 200*l.* Witness was a member of the Transvaal Society of Architects, who worked under the rules of the British Institute. The usual charge was 2½ per cent. when the building did not go on, and 5 per cent. when it did go on. He did

some work for Mr. Osborne about 1897, and received 90*l.*, in extended payments, at the rate of 2½ per cent. Altogether he was employed in the work of preparing the plans and specifications, &c., for the hotel for a period of about seven months.

Cross-examined: He was doing other work during these seven months. 300*l.* would not cover his out-of-pocket expenses in connection with the work. They would be nearer 500*l.* The promissory notes Mr. Osborne gave him were not accommodation notes. Mr. Osborne owed him the money. He never asked Mr. Osborne for a loan.

His Lordship said he could not understand why plaintiff gave Mr. Osborne a cheque.

Witness said Mr. Osborne asked him to do it, and said there was every chance of financing the building in a very short time, and as it was a large building witness was anxious to go on with the work.

Mr. Fisher, a former manager of the Netherlands Bank, gave evidence as to Mr. Nicholson presenting various notes at the bank during 1903 and 1904. Three bills were for collection only. He remembered the bill for 300*l.*, which Mr. Nicholson said was for work done. He made inquiries as to Mr. Osborne's position, and as a result agreed to take it for 200*l.* for two months. The time was afterwards extended, and 50*l.* was paid off.

Professional evidence was also given that the estimated cost of the building was a fair one.

Mr. Osborne, in his evidence, said Mr. Nicholson told him he had only one job on hand at the time, and that he would prepare the plans for out-of-pocket expenses only, it being understood that the balance would be payable on the erection of the hotel. He gave plaintiff 300*l.* for the work done. He bore out in evidence the statements made in his declaration.

His Lordship, in giving judgment, said there was undoubtedly a contract between the plaintiff and the defendant; therefore, apart from any special contract, the plaintiff would be entitled to reasonable remuneration. He had not to decide whether 2½ per cent. would be reasonable, because that had been admitted. Defendant had alleged that there was a special contract, but the plea had not been proved by the defendant. It was now three years since the plans were given to the defendant, and the latter had endeavoured to make use of the plans, and had also admitted that had he built he would have made use of the plans. He could find no proof of any arrangement such as had been contended by the defendant, and therefore the claim of the plaintiff was practically admitted, that he was entitled to remuneration at 2½ per cent. upon the estimated value of the building. There would therefore be judgment for the plaintiff for the 790*l.* 10*s.* claimed, and costs.

WORKS IN THE ROMAN DISTRICT.

In his last report Mr. Consul Morgan says that the improved economic conditions of Italy have helped Rome considerably in its revival after a critical period. Traces are everywhere visible of the altered state of affairs. Large buildings all over the town and in the immediate neighbourhood, which had been left in an unfinished state for want of capital, have now been rendered habitable. The works connected with the municipal "Piano Regolatore," or general building improvement of the town, are in a very advanced stage, greatly to the improvement of the local sanitary conditions and to the convenience of traffic. The embankments, bridges, public buildings and gardens, sewerage, &c., forming part of the said "Piano Regolatore," have been constructed, and on the whole Rome now presents quite a different appearance. There is a growing public feeling that, as far as possible, the district should be emancipated from its traditional dependence on the influx of foreign visitors and rendered self-supporting, as in the case of the chief capitals of the world. The presence of visitors is subservient to so many contingencies, and the season during which they stay is limited to so short a period that the policy of giving the utmost economic independence to the city cannot but be encouraged. Visitors will continue to be drawn by the peculiar attractions of old Rome, and the money spent by them during their stay, a considerable sum, will, if anything, help to foster the industrial revival of the district.

Several years ago Rome was affected by a building crisis which involved considerable loss of money and put a sudden stop to the building mania. Consequently a great many houses in course of construction were left unfinished.

Of late, however, owing to the demolition for the sake of modern sanitary improvements of a great number of houses, the need has been felt of new buildings to meet the requirements of the increasing population. In order to encourage the construction of houses in Rome the Municipality have recently enacted certain regulations dealing with the matter. Among the facilities granted to would-be landlords, one of the most important is the exemption from taxes for a period of ten years on new buildings fit for habitation. Houses intended to be used as hotels, pensions, as well as those which are totally or partly inhabited by landlords, are excepted, and will not enjoy the privilege of exemption. That benefit will be extended to those buildings which were left unfinished at the time of the crisis, provided steps for their completion be resumed within three years and carried out previous to the expiration of double that period from the date of the regulations in question. The privilege of exemption from payment of the tax is limited to houses let to private individuals, provided that the yearly rent payable for each flat or apartment does not exceed 48l.

A firm of Belgian bankers have recently formed a company with the object of building an electric railway line between Rome and Civita Castellana. The capital of the company is 140,000l. The distance between Rome and Civita Castellana by the existing railway line is about fifty miles, and the proposed new line, which follows a regular and direct track, will shorten that distance by fifteen miles. It is proposed that the electric railway should touch Scrofano, Riano, Castelnovo di Porto, Morlupo, Morolo, Rignano, Campagnano, Magilano, Sant' Oreste, Faleria, Calcata, and reach Civita Castellana, passing through fertile grounds covered with olives, vines and forests. At Civita Castellana there are several manufactories of earthenware and ceramics, as well as quarries of travertine. Near Scrofano there are springs of sulphurous water.

It is expected that there will be a great increase in the exportation of products belonging to the district to be served by the new railway, as a great many of the above-mentioned villages are now almost cut off from the centres of consumption and experience great difficulty in carting their produce.

The method, as in the present instance, for contractors and others to bind themselves to use nothing but national material in so far as it is possible to do so seems to be now prevalent in this country. This is done mainly with the object of enlisting the sympathies of the authorities and the public, as well as to foster national industries. If the import duty in Italy, which in many cases is of a protective character, is taken into account, there is no doubt that future contractors will greatly benefit by being able to get locally what they would otherwise have to obtain from abroad. Foreign manufacturers will have to open local branches.

Steam turbines will be used to produce the necessary motive-power, and the system of the current will be monophasic. The train will consist of an electric engine and comfortable carriages for passengers, as well as vans for goods. Trains for the district will leave Rome every two hours. The company contemplates later on extending the line further inland as far as Viterbo.

In one of his previous reports Mr. Morgan explained the result of private efforts to carry out improvements in that tract of land encircling Rome known as the "Agro Romano." It became apparent in course of time that the legislative measures adopted in the past were inadequate for the object in view, and it became necessary to revise legislation on that particular subject so as to hasten the draining of a district which had been left to itself for centuries, greatly to the detriment of the city and of public health.

On December 13, 1903, an Act was passed by the Italian Parliament. The new law is the fruit of past experience, and it is hoped that through its operation the "Agro Romano" will be effectually reclaimed. By this Act exemption from taxes on lands, buildings and live-stock is granted for a period of ten years to all those who carry out agricultural improvements on abandoned land. Exemption from house and cattle taxes is also granted, provided the landowner dwells or stores his products on the spot, and the live-stock is used for work on the land or for dairy purposes.

Government further grants a reduction on registration and mortgage taxes on any deeds or other documents connected with improvements, on condition that the latter be carried out within five years from the date of execution of the deeds. Landowners effecting agricultural and other

improvements may obtain loans from the Government at the reduced interest of 2½ per cent. per annum. The sums thus lent by the Government will be paid over to the landowners in half-yearly instalments, in proportion to the amount of work completed during the half-year covered by the loan.

In the case of a landlord refusing to comply with the enactments of the law, his property will be expropriated and sold by public auction. Should no tender be received the State will purchase the property at the price fixed by three commissioners appointed by the President of the Court of Cassation, and Government is empowered to dispose of the property on its own account.

The necessary funds for the purchase of unclaimed land as well as for the loans to landowners will be supplied to the Government by the "Caisse" of Deposit and Loans, a special department attached to the Italian Treasury, at a yearly rate of interest not exceeding 4 per cent. The difference between the interest charged by the "Caisse" and that payable by the landowners to Government will be defrayed out of the Budget of the Ministry of Agriculture, Industry and Commerce. Government allows certain facilities to purchasers of expropriated lands, provided they carry out the necessary agricultural and other improvements, such as payment of the purchase price spread over a number of yearly instalments, the first of which must not, however, be less than one-tenth of the purchase price. Government will not be empowered to withdraw from the "Caisse" more than 80,000l. a year for the above object.

Roads will be opened by the Government, but the various municipalities will have to contribute one-half of the required expenditure, and will bear the whole expense of the keeping of the roads in good order.

The Municipality of Rome will supply and pay out of its own budget twelve doctors for medical assistance in the "Agro Romano," and will also open schools for boys and girls in all villages having a population varying between 200 and 800 inhabitants, provided such villages are situated far from the district schools already existing.

At Civita Vecchia the building of the new pier which is to close the southern entrance of the harbour is progressing very slowly, and will take fully one year more before it will join the southern extremity of the old breakwater, and thus close effectively the whole entrance.

The part of the northern breakwater destroyed during a gale in 1902 has not yet been rebuilt, and there is little or no probability of the work being taken in hand until the southern entrance is closed and the new quays completed.

The new railway which is to connect the port with the station is still unfinished, and likely to remain so for some time, notwithstanding the fact that its completion is of the utmost importance, owing to the primitive, costly and tardy method which is still in use for carting all goods to and from the station, and which may be considered as the principal cause of this port's lack of development.

After many years of expectation, and after a considerable delay in choosing one out of many projects for providing the town and harbour with a more wholesome and adequate supply of water, the plans of Signori Manassei e Sinibaldi have now been decided upon and approved by the local authorities, and the work commenced at once. The supply of water is derived from the springs of Oriolo Romano, a distance of about twenty miles, and will be conducted to Civita Vecchia in iron pipes, capable of carrying about 4,000 tons per day. A reservoir with a storing capacity of over 5,000 cubic metres is being built on one of the hills overlooking the town at a distance of about a mile, and from here the water will be conducted into town and distributed to every house. The contract price of this work is 60,000l., and it is hoped to have it completed in two years.

The cement factories, of which there are two, are yearly increasing their output, and a considerable quantity of cement is carried by rail to Rome or even further inland.

The Old Cross of Newton, N.B., which formerly occupied a site in Main Street, and has for many years lain in the Newton churchyard, has been re-erected on a site in River Street between the old and new bridges. The historic pillar, which has been handed over by the freemen of Newton to the Town Council of Ayr, bears the inscription, "Neutoun, 1675; rebilt, 1775," and is erected on a new pedestal. The Town Council will erect a railing round the structure.

NOTES AND COMMENTS.

THE numerous admirers of the works of Mr. E. J. GREGORY, R.A., must rejoice at his success in passing through the ordeal of the auction-room. To have a large number of paintings and drawings put up together at the close of the season was a test which few artists could sustain. The prices obtained cannot be said to correspond with the value of the pictures, and under other circumstances much more would have to be paid. The brilliant *Boulter's Lock* is worth more than 770 guineas, for sooner or later it should be in one of the public galleries. Birmingham made a try for it, but without success. *Marooned* was too cheap at 280 guineas. The water-colour *Après* realised 400 guineas. It must, of course, be remembered that the present time does not seem favourable for pictures, however excellent. But the results of the GALLOWAY sale are sufficient to prove that several years' enjoyment of pictures can be obtained at almost a nominal rate.

ONE of the snares of contractors is in undervaluing possibilities. In the majority of cases plans and specifications do not represent all the difficulties, for the architect or engineer is generally limited in the time which is allowed for investigations. There are no fees for the long labour which might be required in the ascertaining of foundations, and much must be left as risk which the contractor should take into account. A case which came before Mr. Justice WALTON in the High Court on Monday suggests the consequences to contractors where they undervalue or ignore serious difficulties. His Lordship had already heard the case at the Manchester Assizes. In 1888-9 Messrs. SHAW and Messrs. FAREBROTHER entered into contracts with the Wilmslow District Council for drainage works. As the operations were not satisfactory, the Council claimed heavy damages for breach of contract on the part of the defendants. The latter denied liability, and counter-claimed for extra work and materials. The dissatisfaction arose out of quicksand. It does not seem to have been expressly stated in the specifications or shown in the sections that such a material was to be encountered. There are precedents for such a mode of description, but it is time they were abandoned. Mr. Justice WALTON, who evidently had sympathy with the contractors, inferred that there was knowledge of the presence of quicksand, for certain provision was made for concrete and timbering. His Lordship also pointed out that the other contractors sent in much higher tenders because they were aware of the obstacle. It is always very hard for experts to determine what are the causes of the differences in the amounts of tenders which are published every week. Without special evidence it would not be safe in the Wilmslow case to suppose that the fear of quicksand controlled the estimates. As for concrete and timber, they might be intended to serve for other purposes. Mr. Justice WALTON admitted that the case was a very hard one, but contractors could not be relieved from their obligations, and he would himself determine the amount of damages.

THE New Museum of Oxford is the strongest example in this country of Ruskinism in architecture. It was designed by Messrs. DEANE & WOODWARD, and was intended to be expressive of some of the plants and animals of England. Those who condemn the style and the planning must admit the beauty of the ornament. FERGUSSON considered the building was the *reductio ad absurdum* of architecture, and, judged by his canons of the art, it may appear strange, but it must always have interest as a memorial of a time when JOHN RUSKIN was a power among the undergraduates. Like so much else with which he was connected it was never finished. The animals and plants which were to give animation to windows and doors, capitals and corbels, had to be limited owing to the cost of the carving. It is therefore

satisfactory to learn that the Rev. H. T. MORGAN, M.A., of Trinity College, has, with the permission of the delegates, undertaken to remove a part of the bareness by having some of the blocks which serve as capitals completed as they were originally designed. The whole of the work would be too onerous a task for an individual, but Mr. MORGAN's enthusiasm may inspire others to imitate him.

AMONG the buildings visited last week by the Durham and Northumberland Architectural and Archæological Society was the school in the village of Ford. It is remarkable for containing a series of figures in fresco, or what is sometimes called fresco in this country. They were all painted by Lady WATERFORD during her thirty years of widowhood. One was produced each winter. The figures represent Biblical characters, though they are all portraits of individuals who lived upon the estate. Mr. HOLMAN HUNT has described them, it is said, as works of the highest art. Many of the figures can be identified. The *St. John the Baptist* was a ploughman, who is now living in Manchester. The rector considers the figures have been useful, for the children and adults of the village are taught by them to realise that the people mentioned in the Bible were once living and not imaginary beings. The drawings made by the children of the school are above the average, which may arise from having the paintings always before their eyes.

THE French Government and the Municipality of Paris have agreed to erect, near the building in the Champs-Élysées where the Salons are held, a memorial of the French School of Landscape Painters of 1830, and especially COROT, TH. ROUSSEAU, MILLET, JULES DUPRÉ, DAUBIGNY and TROYON. The commission for the monument has yet to be given, and we cannot imagine its character. But all who are acquainted with French landscape will agree that it will not possess suggestiveness or veracity unless there is a recognition by Frenchmen of their indebtedness to CONSTABLE, BODINGTON, CROME, COTMAN. Their works, although only occasionally seen, excited an interest that made them appear allied to the literary efforts of the first Romantics. There is no necessity to undervalue the earlier French landscapists, CLAUDE, POUSSIN, WATTEAU and PATER. But between 1820 and 1830 the customary desire for novelty had taken possession of French amateurs, and academic combinations of trees, water, hills, ruins, all arranged according to rule, did not satisfy French taste. CONSTABLE, and next to him BODINGTON, inspired the innovators whose names are to be associated with the memorial. If it should be said the French artists went beyond the Englishmen, that is only a common occurrence in the history of art.

ILLUSTRATIONS.

GAILEY RESTAURANT FROM ALDWYCH.

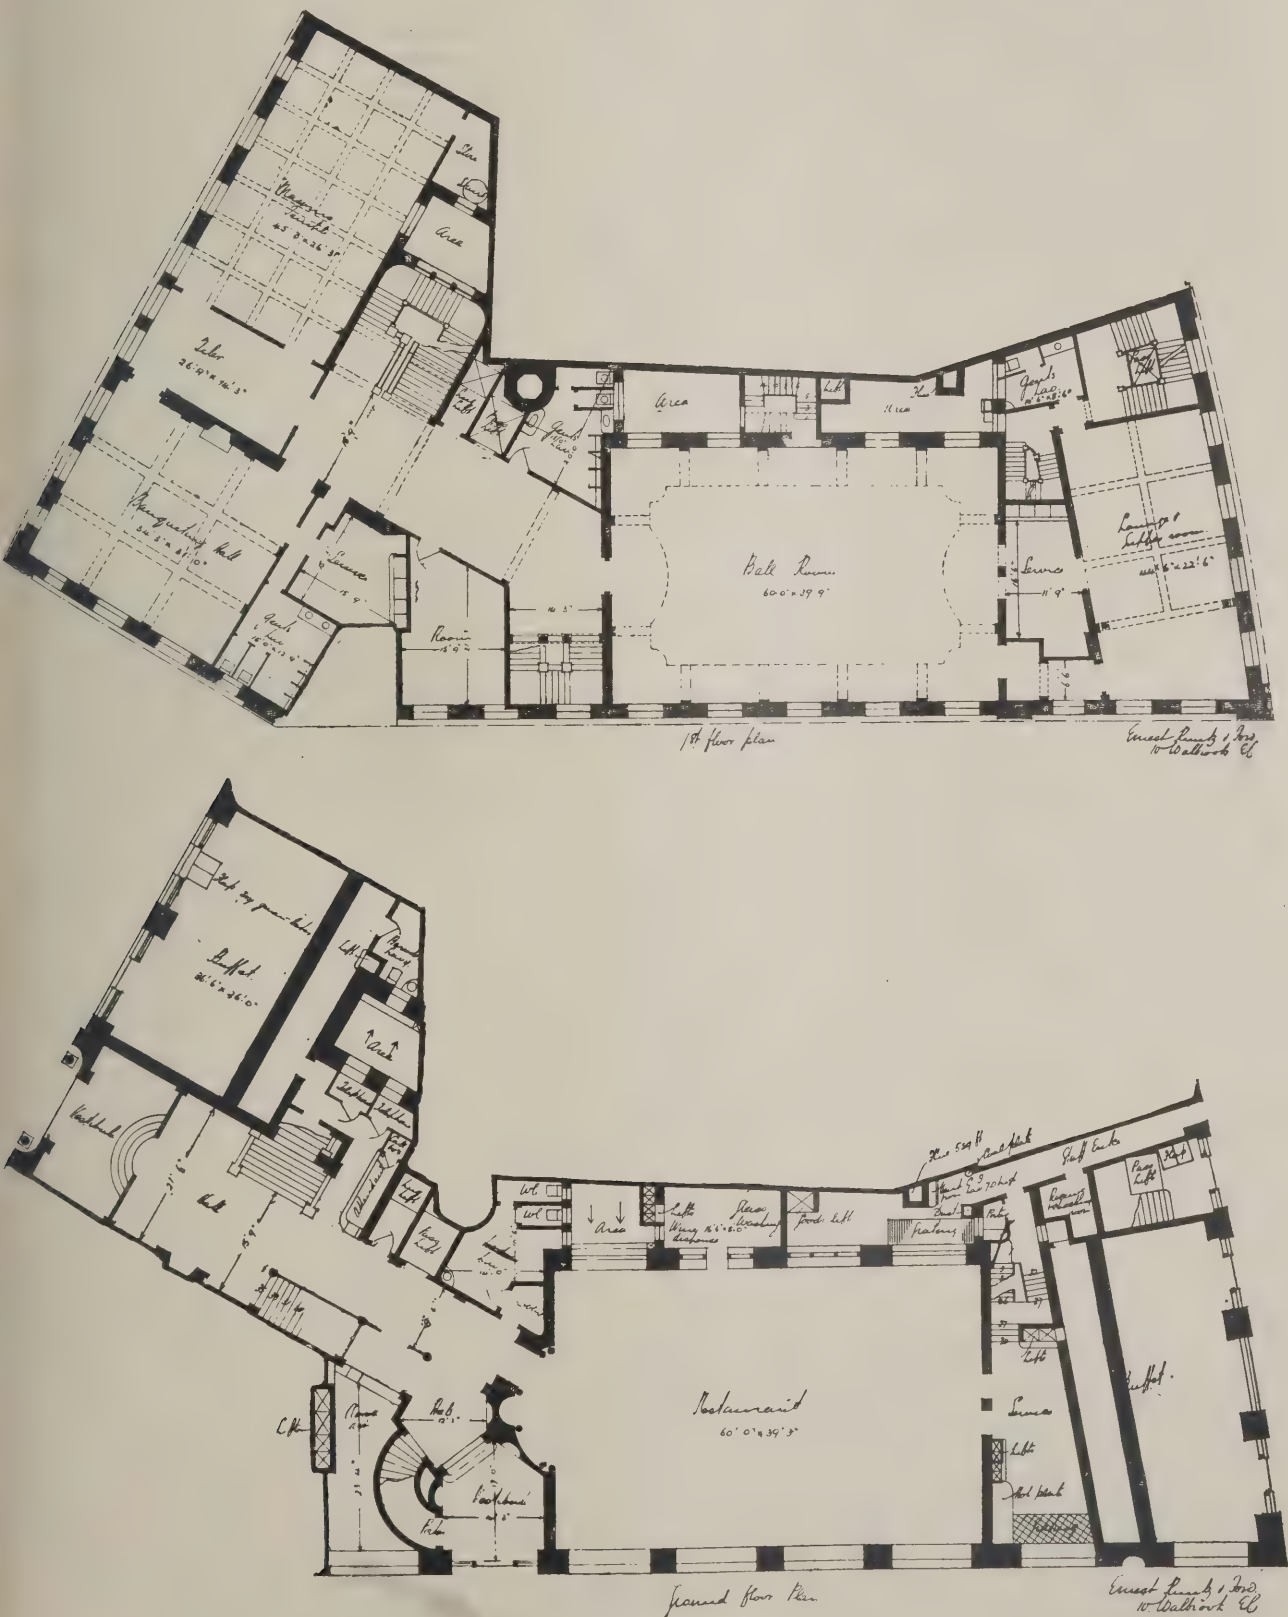

WE publish this week the exterior of the imposing building in the Strand. The Florentine period of the Italian Renaissance was adopted upon the suggestion of Mr. NORMAN SHAW, R.A., whose services and advice with the architects, Messrs. ERNEST RÜNTZ & FORD, cannot be over-estimated. The bold masses simply fenestrated and surmounted by the interesting carved frieze, of which illustrations have appeared in *The Architect*, cannot fail to arrest the attention of passers-by. The whole of the façades are executed in Portland stone, and the cornice, fixed at a height of 80 feet, is the largest in London, below which is the ornamental frieze, the work of Mr. HIBBERT BINNEY; beyond this rises a two-storeyed Mansard roof built entirely of steel and concrete. The remainder of the carved ornamental work was entrusted to Mr. GILBERT SEALE, of Camberwell.

THE POSITION OF THE MUNICIPAL ENGINEER.

THE annual meeting of the Association of Municipal and County Engineers was held last week in Norwich. Mr. A. E. Collins, the city engineer, delivered an address. He said:—My connection with municipal engineering is co-equal with the life of this Association. I have seen great changes in public work. The growing town in which I served my articles had a population of some 60,000, yet the professional work of the borough engineer's office was done by the borough engineer and three pupils, there being no paid assistants. Probably this is representative of the small

volume of work passing through most municipal offices in those days—quiet days never likely to recur for municipal engineers. Since those days constant additions to the statutes we have to administer, the gradual abolition of the contractor, and continuously growing demands by the public for greater convenience, healthiness and beauty in connection with all public works have enormously increased our duties, and to-day their volume and variety is so great that a growing town of 60,000 inhabitants, to insure the proper prosecution of its public works, must provide its engineer with a considerable and varied expert staff. Our work is of such a wearing, anxious and absorbing character that more than any class of officers we should

GAIETY RESTAURANT.—PLANS.

be relieved by the public we serve from as much anxiety as possible, and it is for the public advantage, at least as much as our own, that such should be the case. Borough and county engineers and engineers holding similar appointments under local authorities generally, whom I will hereafter describe under the collective term "municipal engineers," are more liable to earn dislike in properly carrying out their duties than any other officers of such authorities, and cases often occur where antagonisms made by the performance of duty have caused the driving from office of some of the best members of our profession.

A man whose position is endangered by enmities caused by the proper performance of work and duties is not so free to serve the public properly as were he efficiently protected. The absorption and anxiety attached to our work and the inadequate salaries usually paid prevent us from making such provision for the future as men relatively as successful in ordinary walks of life as we are in our own. I doubt whether any other profession or business exists where the amount of study and work of preparation and constant daily anxiety are so great relatively to incomes earned as in our own. I do not remember a single case of one of our profession accumulating an ample competence from its practice. The greatest of prizes in it are small compared with those of other employments demanding anything approaching the same continuous, anxious, responsible labour. The Local Government Board, the central authority to which so much of our work is subject, have not given the position of municipal engineers the consideration it requires and deserves. It appears, in fact, that we are purposely placed in an unfair position by the Board whenever it is possible to do so. For instance, many consents of the Board to local authorities to raise loans for works designed and carried out by municipal engineers have been conditional upon these engineers receiving no payments from the loans. At the same time payments are authorised to clerks to local authorities, whose work relative to the matters in question is not a tithe of that of the engineers. Further, it is not prohibited to make loans to engineers in private practice.

Municipal engineering is a living, growing profession, having to do consequently with ever-changing practice. For a municipal engineer to keep pace with his profession, and to give the best service to his authority, he must constantly inspect and study the newest developments, and our Association arranges visits of inspection to municipal works of all sorts to aid its members in this; yet the Local Government Board requires its auditors to surcharge payments by local authorities of expenses to our members in attending our meetings. This action of the Board, more than anything else within my knowledge, shows the necessity for it to make the most careful and searching survey of its position relatively to municipal engineers. It is necessary to local authorities for their engineers to have the fullest knowledge of the progress of municipal engineering. At the same time, it is unfair and unjust for their engineers, mostly an underpaid class, to be out of pocket in obtaining such knowledge for the benefit of their authorities. Again, the Local Government Board, when appointing inspecting engineers, whose chief duties are to hold inquiries and report on work done by municipal engineers, should endeavour to fill vacancies from the ranks of municipal engineers; it is rarely, however, that such is done. I believe it would be to the advantage of the public generally if municipal engineers of ability and experience were appointed to such positions, and if they could look forward to occupying these appointments as the reward of good service. The Local Government Board could greatly help local authorities, the public and municipal engineers by obtaining authority from Parliament for, and requiring that none of our appointments be held by other than competent properly paid men, and by protecting such men when appointed from improper dismissal. Further, the Local Government Board should itself promote legislation insuring superannuation to engineers, town clerks and other officials of local authorities now omitted from superannuation schemes. This superannuation is already the case with Poor Law and asylum officers, police and others.

The Association of Municipal and County Engineers have done great preparatory work towards enabling the Local Government Board to insist on none but competent persons being appointed as municipal engineers. For the whole of its existence the collection and dissemination of knowledge necessary to the efficient performance of duty has been almost its sole aim. During this time the professional capacity of municipal engineers has vastly in-

creased. Even I am able to remember the case of a man who was borough surveyor of a town of over 100,000 inhabitants who did not know how a sewer-manhole should be built, and had to send outside his own office for a design. To-day any one of us is expected to design and carry out works of the most intricate and complicated character, and in the great majority of cases we do it and do it well. Again, as assisting the Local Government Board in connection with municipal engineering appointments, the Association has for many years conducted examinations to ascertain the suitability of candidates for such appointments, and before permitting a candidate to sit an examination, insuring that his education, training and experience are such as to be likely to fit him for his profession. The preliminary investigations and the examinations themselves are so carefully and thoroughly performed that the risk of an unqualified man receiving our certificate is reduced to a minimum. Without going further into detail as to the manner in which the Association has done its utmost to enable it to be known who are competent, I think I have said enough to show that we have done our part in paving the way for the Local Government Board to assist public authorities and ourselves in appointing and retaining efficient engineers. To obtain the advantages which we are entitled and justified in expecting, each individual of us must use his influence wherever and in whatever direction he can exercise it. We must educate the members of the authorities we serve, the public, and last but not least, members of the Legislature with whom we come into contact, with respect to the benefits to the public and the fairness and justice to municipal engineers and the officials of local authorities, arising from granting what is asked. One of the most important matters for our discussion at this meeting is that of new streets and building by-laws, a subject which has for a long period been under the very serious attention of your Council, aided by the able and painstaking sub-committee to whom this subject was referred. Whilst I will not anticipate the paper and discussion on this subject, I desire to express the hope that, as the result thereof, we may greatly help toward showing how pleasant, comfortable, sanitary, safe and durable houses may be erected at less cost than is possible under the by-laws now generally in force. I will only add in this matter that excessive fear of fire is, in my opinion, responsible for some of the present troubles. In concluding, I desire to express the hope that this meeting in Norwich will be remembered hereafter as a most valuable and enjoyable one, and that during my year of office I may be able to help the progress of our Association.

OXFORD ARCHITECTURAL AND HISTORICAL SOCIETY.

THE annual general meeting of the Oxford Architectural and Historical Society was held in the lecture-room at the Ashmolean Museum. Mr. J. L. Myres, F.S.A., of Christ Church, was elected president for the ensuing year. Mr. F. Madin and the Rev. W. Maunsell Merry were appointed auditors.

The Secretary, in presenting his report for the year, said the Society was in its sixty-seventh year, and continued to be a rallying-point for those who desired to incorporate their zeal for architecture and history. The number of members steadily increased, thirty-four new members having been elected during the past year; at the same time the known loss, through death and resignation of eight members was to be regretted, and the feared loss of fifty-six more owing to nonpayment of subscriptions. The Society desired to record its gratitude once more to those who had taken a leading part in its conduct, especially to the President, who had given much time and thought to its affairs in the midst of many University and other engagements. Mr. Allfrey had also earned its thanks for his readiness to assume the office of acting vice-president. As in former years, the activity of the Society had been most widely displayed by its excursions and evening meetings. Visits had been paid to the following places outside Oxford:—Kidlington, Cumnor, Hampton, Boyle, Sandford, Littlemore, Merton and Charlton-on-Otmoor, Bloxham, Adderbury and King's Sutton. It was a pity that a larger number of members did not take the advantage offered of enlarging their acquaintance with places of interest in the surrounding country, and it became a subject of serious consideration whether it was worth while to arrange excursions of interest apparently only to some score of its 276 members. Visits to

ices of interest in Oxford were more popular. The Society desired to record its sincere regret at the death of Rev. H. L. Thompson, who had always been ready to place his exceptional knowledge at its disposal. The evening meetings also had an average attendance of about twenty members and friends. Mainly owing to the zeal of the President, lectures had been given by Mr. R. N. Hall, Professor Flinders Petrie, Mr. Louis Dyer, Dr. Odgers, the Rev. Gregory Smith, Mr. G. H. Blakiston and Mr. P. Manning. In conclusion, it was fitting that the Oxford Architectural and Historical Society should express its congratulations to the Archæological Society of the neighbouring county of Bucks and its hope that the exhibition about to be held in commemoration of its jubilee would be successful in stimulating the true antiquarian spirit, which was the concern of both societies to foster to their utmost ability.

The report was adopted.

RUTLAND ARCHÆOLOGICAL SOCIETY.

THE members of this Society recently joined in an excursion to the Fens at Northborough. The manor-house, or, as it is locally termed, the Castle, was inspected. The house not only is interesting architecturally as being one of the few remaining examples of fourteenth-century domestic architecture, but has historic associations as having been the home of Oliver Cromwell's daughter, Elizabeth Claypole, and also the place where the Protector's widow ended her days. Passing on to the church, a structure exhibiting features of Norman, Early English and Decorated periods, a short time was occupied in an examination of its architectural details. The west front, surmounted by a bell-cot, is the earliest portion of the building, being twelfth-century work; the nave, aisles and chancel are Early English, and the large south transept, known as the Delamare and later as the Claypole chapel, is a fine example of fourteenth-century Decorated architecture. This part of the church is the reputed resting-place of her whom Charles II. irreverently called "Old Noll's wife." The visitors then left for Crowland, the drive through the Fens being very enjoyable, and passing the unique "Triangular Bridge," the abbey was reached. The secretary, Mr. Crowther-Beynon (who had also furnished a description of the castle church at Northborough), gave a brief history of the abbey from the landing of Guthlac in 699, tracing the fortunes of the building through its long course of misfortunes due to unstable foundations, marauding hordes of Danish invaders, numerous fires, earthquakes, storms and Puritanical iconoclasts. A tour of inspection of the ruins was then made, special note being taken of the west front, the chief glory of the abbey. The majestic Norman arch of the central lantern was also admired; but to attempt to describe Crowland in detail would be an endless task. After separating for lunch the party reassembled at the bridge at 2.30, and the return journey was begun. After viewing the very interesting little Norman church of Peakirk, with its most striking south door and tympanum, and also the hermitage (the building now standing on the site of the cell of St. Pega, Guthlac's saintly sister), under the guidance of the rector, the return was made to Helpston station.

RECONSTRUCTION OF CALCUTTA.

THE uneasiness caused by threatened and improper, or at any rate most impolitic, acquisitions of land round Government House would appear, says the *Indian Engineer*, from all that is being said, and even published, in Calcutta, to form part of a widespread feeling that the Government, from whom considerate sympathy for the classes to whom, more perhaps than any other, the capital is indebted for its great and growing prosperity, could hardly have behaved more inconsiderately and more unsympathetically. The city is on the eve of reconstruction, during which some considerable changes must be brought about in its internal conformation. It had been hoped that, while the reconstruction proceeded mainly upon sanitary lines, economic considerations would not be entirely banished from view; and that, while both the labouring and menial classes would be cleanly and cheaply housed, within easy reach of their respective spheres of work, accommodation would also be provided to meet that growing expansion of business which bears to the material prosperity of the city something of the

relation that the tissue-making blood circulation bears to the human body. In this state of uncertainty and expectation, the Government, without any indication of probable developments resulting from the approaching city improvement scheme, pounces down upon the heart of the business quarter and gravely announces to places of business which have been in existence for over half a century, that their premises are needed for the "public purpose" of housing Viceregal domestics, bandmen and stable boys with their horses—all of whom might now be where they are or be removed half a mile further from Government House without the least inconvenience to anyone worth thinking of—while no hint is given where the displaced business places are to go, though they cannot go far without serious loss to themselves, and, what is worse, without grave inconvenience to thousands of residents who resort to them. The fact that present busy scenes of traffic will remain closed for eight months of the year, while their cold weather occupants are in Simla, appears never to have entered the thoughts of those who have planned this extraordinary manœuvre, which is not unnaturally regarded by its victims in the light of an arbitrary spoliation. The claims sometimes advanced on behalf of the Viceroy to statesmanship make it incredible that His Excellency can be so entirely wanting in the sense of proportion, which is an essential element of statesmanship, but of which an entire absence seems to be the distinguishing feature of the proposed manœuvres. If the Viceroy has merely given general instructions, which departmental subordinates have mistaken, His Excellency owes it to himself to put a stop to the mischief which has been set agoing. In the other contingency the public surely owe to themselves at least to tell the authorities what kind of treatment they reasonably expect from the Government.

THE HEATING OF BUILDINGS AND DUST DEPOSITION.*

IT was with some hesitation that I yielded to the renewed request of my friend, your former president, Mr. W. R. Maguire, to prepare a paper for your annual meeting, as I am a learner, not a teacher, in your midst. As, however, you did me the honour of electing me the first honorary member of your Institute, I felt it would be an ungracious act on my part if I made no attempt to comply with this request, though I fear there is little I can say that will be of much practical service to you.

Certainly none of the practical applications of science are more important and few so little understood as the two subjects which this Institute was founded to promote, viz. the efficient heating and ventilation of buildings. It is true these subjects have been and are discussed at the Institute of Civil Engineers and at the Institute of Architects and at other societies for the advancement of pure and applied science. But in the complex human life of the present day the tendency is towards greater specialisation, and both engineers and architects, and professional men generally, have so many other duties to claim their attention that they are glad to delegate to a special class of experts the study and the practical carrying out of particular branches of their profession. Hence the union of those who are engaged in the actual business of warming and ventilating buildings is an excellent idea, for the reading and discussion of papers on these subjects, the interchange of opinion, and above all, the collection and publication of the practical experience gained in the numerous undertakings you have carried out—both as regards the relative efficiency and economy of different systems, as proved by the actual results you have obtained—these are questions of the greatest value to the health and comfort of mankind.

Let me now turn to some of the scientific aspects connected with the subjects of heating and ventilating. All heating appliances depend upon the transference of heat from some source to the parts of the building it is intended to warm. I need hardly remind you that this transfer can be effected in three ways: by the slow process of conduction, by the quicker process of convection or by the swift process of radiation. In the case of hot-water pipes all three processes are at work, the heat is conducted through the iron pipes, which warm the room both by radiation and convection. In the case of an open fire radiation is practi-

* A paper read at the summer meeting of the Institution of Heating and Ventilating Engineers at Bristol, on June 20, by Professor W. F. Barrett, F.R.S., &c.

cally the only agent by which the heat is distributed to the persons in and to the walls of the room. As the air is almost as transparent to radiant heat as it is to light, the air of a room cannot be warmed by radiation, and hence our domestic open-fire grates warm the room indirectly by heating the floor, walls and furniture, and these absorbing the radiant heat warm the adjacent air by convection. This latter process consists, as you are aware, in the transfer of heat by moving masses of the warmed air or other fluid, the motive force being gravity, the colder denser air displacing the lighter warm air. These currents are the means by which all fluids are heated, as both gases and liquids are extremely bad conductors of heat.

A few years ago a make-shift mode of warming a small room was introduced, which is no doubt familiar to you; the ordinary glass globe round a gas flame was replaced by an enamelled iron globe closed at the top. At first sight it would appear that such an arrangement would simply obstruct the light of the gas flame and give no heating advantage. But as a matter of fact a small room can be much more quickly warmed in this way than by a naked gas flame. I made several experiments during one winter to test the matter. By suspending thermometers at different heights above the floor the naked flame was found, as might be expected, to heat the upper layers of air near the ceiling, as its heat energy was chiefly expended in producing convection currents; hence the walls of the room and the lower strata of air were hardly warmed at all. With the iron globe on a very different result followed. The temperature of the air near the ceiling rose but slightly, the heat energy was now largely expended in radiation from the hot globe, and so the walls of the room and thus the atmosphere in the lower part of the room were comfortably warmed. Thus the paradoxical effect is explained, greater heating efficiency being produced without any increase in the consumption of gas. Of course the system is a bad one owing to the vitiation of the air by the products of combustion, but the atmosphere of the room can be changed after the gas is extinguished, and the walls will still retain a certain warmth. I only mention this in passing to show that an elementary knowledge of experimental physics enables one to clear up the anomalies that frequently arise in the course of your work.

In connection with the subject of ventilation, an instructive set of experiments has recently been made by my colleague, Professor W. N. Hartley, D.Sc., F.R.S., on the proper construction and effective ventilation of fume chambers employed in a chemical laboratory. A paper embodying the result of these experiments was read by Professor Hartley before the Royal Dublin Society in March last.

Now let me turn for a few minutes to the vexed question of the heating and ventilation of large public buildings. The evidence given before the select committee on ventilation appointed by the House of Commons in 1903 contains much instructive matter, and shows that in buildings mechanically ventilated by driving in warmed air a lack of freshness is produced for which no adequate explanation has been found. Few systems have excited more animated, and in some cases interested, controversy than that which has been called the Plenum method of combined heating and ventilation. Some architects are apt with too little discrimination to specify this system in the various public buildings they design. But as you are all aware, the Plenum system, whilst it has merits of its own, has also very grave defects, and when used at all must be used with great discrimination and only applied to special cases. One of the most perfect examples of the Plenum system is to be found in the Royal Victoria Hospital, Belfast. The architects of that building, Messrs. Henman & Lea, read an admirable and exhaustive paper on the subject before the Royal Institute of British Architects, which was printed in extenso in the Journal of that Institute for December 19, 1903. An animated discussion followed, which was renewed six months later, and the additional criticisms and replies are to be found in the Journal of the Institute of Architects for June 11 and 25, 1904. Anyone who desires to master the pros and cons of the Plenum system could not do better than make a careful study of Mr. Henman's paper and this discussion. Having read the whole carefully, and consulted with friends who have seen this system at work elsewhere, I gather that the advantages of the system may be briefly stated to be:—(1) The evenness of the temperature produced; (2) the ventilation of the building is concurrent with its warming; (3) the air can be drawn from sources free from contamination and can be

filtered from suspended impurities, warmed and brought to the proper hygrometric state before its introduction to the different rooms or wards; (4) the degree of temperature and of ventilation can be easily controlled in any part of the building; and (5) the removal of ugly pipes running through the rooms has a great architectural and æsthetic advantage. These are great merits. As for the economy of the system the evidence appears to be conflicting, but must be remembered that in the Plenum system double work is done—the air is not only warmed but perpetually being changed; ventilation is concurrent with heating, and therefore, in considering the question of cost, it is only fair to remember it combines two distinct operations.

On the other hand, the disadvantages of this system for the heating of ordinary buildings or colleges are very great:—(1) The most obvious is that no windows can be opened nor doors left open; double doors with an air lock between must also be provided if the doors are frequently opened and closed. (2) The mechanical arrangements are elaborate, and the system requires to be used with intelligent care. (3) The whole elaborate system needs to be going even if only one or two rooms in a large building require to be warmed, as often happens in the winter vacation of a college. (4) The temporary failure of the system, through the breakdown of the engines or other cause, throws the whole system into confusion, and if, as in the Royal Victoria Hospital, the windows are not made to open, imminent danger results. (5) Then also in the case of hospital wards and asylums it is possible that the outlet ducts may become coated with disease germs, and, unless periodically cleansed, a back current through a high wind or a temporary failure of the system may bring a cloud of these disease germs back into the wards. As a matter of fact, the warm vitiated air will deposit a layer of dust or disease germs on the cooler sides of the duct through which it passes; this question of dust deposition I will return to presently. Nor do I like the plan of introducing the pure warm air at a high level and extracting the foul air at a low level, though this does not seem essential to the system; it is, moreover, very doubtful whether a complete renewal of the air in a room or ward does take place. Unless the air be kept in agitation I imagine a current of pure warm air would pass from the inlet to the outlet, leaving stagnant portions of air above and on either side of the inlet. There are, undoubtedly, many buildings to which the Plenum system is entirely unsuited and objectionable, and there are some where it seems an eminently good system, such, for instance, as the crowded waiting-room of a hospital or police court, or an operating-room of a hospital, or for rooms or halls or churches where a crowded audience assembles and where open windows are rarely to be found, or cannot be permitted owing to outside noises, &c. In these cases, however, any system which, without creating draughts, supplies fresh warm air is suitable, and the determining factor is the question of economy and simplicity.

I feel sure that brief contributions recording their experience from members of this Institution who have had considerable practical acquaintance of the working of various systems of heating and ventilation would be of the very greatest scientific value. Even a few lines of reply to a printed form of questions sent out by the secretary, if answered by those who have no axe to grind, would be of great value. It is much to be regretted that we have so little exact knowledge of the best system of heating and ventilating large buildings. Professional and commercial interests are apt to obscure the truth when papers are read or discussions occur on any special system. Moreover, to determine what is best involves not only the question of efficiency and economy but also of healthiness and convenience.

As regards steam heating one disadvantage is obvious, that no heating occurs until the water in the boilers is actually generating steam, whereas in a hot-water system the circulation and warming begin directly heat is applied to the boiler. Those who have had experience of different systems of heating large buildings, I find, generally concur in giving the preference to hot-water circulation, independently of the ease with which it can be controlled. The heating of hot-water radiators by injecting high-pressure steam into the system seems to me one of the simplest and best ways of transmitting heat throughout a building.

Ideally, of course, electric heating would be the best, as the electric current can be conveyed with the least possible loss throughout any building, and then by traversing suitable resistance coils the current can be made to generate heat in

ny room and at any moment by merely turning a switch. But at present this system is impracticable, except as a luxury, owing to the cost of electricity. In the neighbourhood of a waterfall, however, the utilisation of the energy of the fall and its transformation into electricity—and thence to heat—would be a practical project, for the heat generated by the current is proportional to the square of the current strength into the resistance of the radiating coil. The difficulty of finding suitable resistances (for the radiating coils) which will stand a high temperature without disintegration would no doubt be surmounted if electric heating became general. As a matter of fact, some excellent plans have been adopted which are well known to electricians, but I need not go into these here, except to mention that some of the remarkable alloys of steel, made by Mr. Hadfield, of Sheffield, have an enormous electric resistance and give promise of utility in the direction of electric heating.

To return, however, to a hot-water system heated by injecting high-pressure steam, one objection has been the noise made by the injected steam. Anyone can hear this by allowing steam to escape from a pipe held below the surface of water; a noisy rattling and bumping occurs until the water is raised to the boiling-point. But a noiseless steam injector has been made and is in use, so that this objection is removed. When, therefore, there is waste steam, at say 40 to 50 lbs. pressure, coming from a boiler used for power purposes, nothing could be more economical nor simpler than to utilise this steam for the transmission of heat by injecting it into a hot-water system whenever needed. Properly jacketed steam-pipes are used in America to convey heat and power to remote distances, and I do not know why the method of heating by steam injected into a water system has not become more general; the circulation of the water is accelerated by the steam jet and the regulation of the heat is perfectly under control by simply turning the steam jet on or off. The economy of this system, when special high-pressure steam-boilers must be supplied for the purpose, is a question worth careful examination. I am inclined to think it would show favourably if the boiler were also used to drive an engine and fans for the ventilation of the building.

In all these systems the air is warmed; the walls of the room are therefore cooler than the air, and it is a matter of common observation that when this is the case the walls become rapidly covered with dust and dirt. On the other hand, when the room is warmed by an open fire the air is not heated by the radiation from the fire, but the walls are, and it is the warm walls which warm the room. When this is the case—the air being cooler than the walls—much less dust and smoke are deposited on the walls, which therefore remain cleaner much longer than in a room which is heated by warm air. This is notably seen in the difference between the wall-papers in a room heated by an open fire and a room heated by a stove; in this latter case the wall-papers become rapidly disfigured and dirty by an unsightly deposition of dust. Many are under the impression that this is due to the dust and dirt caused by the stove or the leakage of smoke through the joints in the stove-pipes; but that this is not the cause is seen from the fact that gas-stoves give rise to precisely similar dirtying of the walls as coke-stoves, and, as I have said, so do systems of heating by hot air. In fact, everyone must have noticed the upward stream of dust and dirt that attaches itself to the wall in the immediate neighbourhood of a radiator, whether that radiator be warmed by hot water, steam or gas. So great and so constant is this disfigurement that it has been urged as an objection to the use of radiators and heating by hot-water pipes; and in some cases the radiators are placed in the middle of a room or far from the walls to get rid of this annoyance. The same thing may be noticed where hot-water pipes run along the wall; near the pipes the wall gets blackened.

Probably few, if any, of those present have thought of the reason, or been able to find a reason, for this annoying disfigurement. Clearly it cannot be due to any dust created by the radiators, for they are perfectly clean surfaces. It is therefore a matter of some importance to try and ascertain the cause, and thus, if possible, remedy this defect in the use of all radiators. For this purpose we must turn to physics, and the investigations of Aitken in Scotland and Lodge in England on the phenomena of the deposition of dust have in recent years given us the solution of this curious and important practical matter.

Many years ago Professor Tyndall noticed that when dusty air was strongly illuminated by a sunbeam or by the

electric light there rose from the summit of any heated body placed within the dusty air a stream of dust-free air. This was rendered apparent by its not scattering the light; and hence a fine black stream was seen rising up from the hot body. Anyone can see this by heating a wire or rod of metal and putting it in a glass vessel filled with smoke; upon brilliantly illuminating the smoke a sharp black line will be seen above the hot line or rod. Tyndall, Frankland and Lord Rayleigh have given different explanations of this experiment, but none were satisfactory. Professor, now Sir Oliver Lodge, and his demonstrator, Mr. J. W. Clark (a former student of mine) took up the matter, and their numerous experiments and suggested explanation were published in July 1883 and early in 1884. Almost simultaneously Mr. Aitken in Scotland began working at the matter, and arrived at much the same explanation as given by Professor Lodge. The beautiful experiments made by Mr. Aitken were published in a paper read before the Royal Society of Edinburgh in January 1884.

The general result of all these experiments showed that the inevitable tendency of fine dust particles is to be driven away from warm surfaces and to deposit themselves on any neighbouring cold surface. The dust-free stream of air rising from a hot body is caused by the warm body being surrounded by a dust-free coating of air, and the ascending current of warm air carries this dust-free layer with it, giving rise to the dark stream line seen above the warm body.

Many striking experiments were made by Mr. Aitken to show the tendency of dust to leave a warm surface and attach itself to a cooler surface. Thus if two mirrors, one hot and the other cold, are fixed face to face near to each other and placed for a few minutes in a vessel filled with a dense cloud of dust, formed by burning a little magnesium wire within the vessel, it will be found when the mirrors are removed that the warm mirror is perfectly clean whilst the cold one is coated over with magnesia dust. Or if two glass rods, one cold and the other hot, are dipped into some hot magnesia powder and then taken out, the warm rod will be found to come out quite clean, but the cold rod is thickly coated with an adhering mass of powder.

But the most interesting illustration of the repulsion of dust from a warmer to a cooler surface is seen in the accompanying picture, which is from a photograph of the wall in my study at the Royal College of Science, Dublin, a room heated by a gas stove. The end walls are timber framing with plastered and painted surface, and you will notice wherever the wood framing occurs the wall is clean, whereas the rest of the wall is darkened by adherent dust. In fact, the wall appears to become transparent—showing the wooden studs through the plaster. This is due to the fact that the wood, being a bad conductor of heat, remains warmer than the adjacent plaster, and hence the dust leaves the part where the wood is beneath and attaches itself to the cooler plaster. The same effect is sometimes seen on plastered ceilings.

It looks as if the old idea of a repulsive force produced by heat was after all correct. In fact, if we heat in a crucible any fine incombustible powder such as magnesia or silica, we shall see the particles of the powder become self-repellent and mobile like a liquid. Heat, we know, does lessen the cohesion of bodies, making a rigid and brittle body like glass to become ductile and viscous; it does drive the molecules of bodies further apart, causing a cubic inch of water to become nearly a cubic foot of steam, or 273 cubic feet of air at the freezing-point to become 373 cubic feet at the boiling-point. But the expansion and the change of state from solid to liquid and liquid to gas, produced by heat, is due to the greater amplitude of vibration, the increased width of the swing of the molecules of a body, and does not necessarily involve a repulsive force radiated from the hot body, though its kinetic energy is increased by heat.

How, then, can we explain the curious effects I have mentioned of dust repelled from a hot surface and attaching itself to a cold surface? Probably everyone present is familiar with Sir W. Crookes's radiometer, that beautiful little heat mill, with vanes black on one side and bright on the other, pivoted in a highly exhausted glass globe. The vanes are rapidly driven round on the approach of a warm body, or by the warmth of the sun or a distant flame. Here the heat can only reach the vanes by radiation passing through the glass and the exhausted globe; the radiation is absorbed by the blackened surface of the vanes; this side is therefore warmed and is instantly repelled. The true explanation of the motion of the vanes was suggested in the first instance by Crookes and afterwards explained more fully by Dr.

Johnstone Stoney and Professor Osborne Reynolds. It is due to the fact that although the radiometer has been exhausted to a higher vacuum than any ordinary air-pump can produce, nevertheless there are millions upon millions of molecules of air still remaining in the little glass globe. All these molecules are in incessant and rapid motion, bombarding the interior of the vessel and the vanes of the radiometer with their impacts, which occur billions of times in every second. The pressure of all gases is due to this bombardment, and proportional to it, hence on the outside surface of the glass vessel the bombardment is vastly greater than on the inside surface, for the full atmospheric pressure is outside while inside there is a high vacuum: but the glass is strong enough to bear the stress of these molecular projectiles. When the temperature is uniform inside the vessel, the vanes are unmoved by the bombardment, for it is exactly equal on both sides of each vane. If, however, the temperature of one side of the vane be raised, the molecules of air adjacent to it are warmed; an increased velocity, and therefore greater energy, is thus given to them, and the rebound of these molecules drives the blackened face backwards. But to keep up this difference of pressure on the two sides of the vane, the warmed molecules must be continually cooled; they expend their increased energy or warmth partly on their neighbours and partly on the cooler glass of the vessel. Hence between two adjacent surfaces, if one be kept cooler than the other a pressure exists, and this has been called Crookes's pressure from its discoverer. You will therefore see that if we removed all the molecules from the globe, if we perfectly exhausted the radiometer, the vanes would not move. This is the case, and in fact this is one of the best tests we have of a very perfect vacuum.

Now it has been suggested that this repulsion of the dust from the hot surface is due to a cause similar to that which rotates the vanes of the radiometer; it is true the width of the layer of dust-free space is much greater than we should expect in air at ordinary atmospheric pressure. But the dust particles are very minute and very light, and there can be no doubt that repulsion occurs, the molecular bombardment being from the hot surface towards a colder surface. This molecular convection does not, however, extend very far, and probably ordinary convection currents come into play and carry the dust particles across to a distant cool surface. There are, however, some phenomena connected with this subject which seem to require fuller investigation and explanation.

Here, however, we have a practical means of filtering air from dust; it is only necessary to have two concentric tubes, the inner one conveying steam and the outer one kept cold; any dusty air passed between the hot and cold tube will deposit its dust on the inner surface of the cold tube, and much finer dust or germs can be so deposited than can be stopped by filtering through ordinary screens.

Mr. Aitken has shown that every drop of rain has a nucleus of some sort—usually a dust particle. In fact, the ease with which vapour condenses to fog is a test of the presence of numerous smoke or dust particles; if there are few dust particles in the atmosphere the vapour forms a mist or fine rain, and the purity of mountain air no doubt explains the mountain mists so frequent in the Highlands. Were there no nuclei at all condensation would not occur. This discovery led Mr. Aitken in 1893 to devise a pocket dust counter. The air in a small vessel is first rendered dustless and exhausted by a simple device, and then a sample of the air to be tested is admitted. This is chilled by partial exhaustion, and the condensed vapour falls down on to a plate in tiny droplets, each drop having a dust nucleus. By counting these drops in any small area the number of dust particles in a given volume of air is found. Thus in the purest mountain air about 250 dust particles per cubic centimetre were found. In clear country air 500, whilst in London and Paris, the number of solid particles varied from 80,000 to 210,000 per cubic centimetre. I think Mr. Aitken's ingenious little instrument should be in the hands of every engineer, so as to test the value of the screens used to filter the air admitted to buildings.

The following are some of the conclusions arrived at by Mr. Aitken:—

1. The earth's atmosphere is greatly polluted with dust produced by human agency.
2. This dust is carried to considerable elevations by the hot air rising over cities and from the sun-heated areas of the earth's surface, and by winds driving the dusty air up the slopes of hills.
3. The transparency of the air depends on the number

of dust particles in it and on its humidity. The less dust and the dryer it is, the more transparent it is. Water apart from dust does not seem to affect its transparency.

4. Haze is generally produced by dust; if the air dry the vapour has little effect, the density of the haze depending chiefly on the number of dust particles present.

5. The dust particles in the air have vapour condensed on them, though the air itself may not be saturated.

6. The amount of vapour condensed on the dust in saturated air depends on the humidity of the air. The higher the humidity the greater the moisture held by the particles when the air is not saturated.

7. The amount of dust in the atmosphere of populous country districts varies with the velocity and the direction of the wind. Fall of wind is accompanied by an increase of dust. Winds blowing from populous districts generally bring dusty air.

An important effect of minute particles of dust in the air is the scattering of light in the atmosphere. If our atmosphere were perfectly pure and free from suspended particles of dust and moisture there would be no twilight. When the sun had sunk below the horizon, its rays would pass through our atmosphere into space without illuminating the sky; and the moment the sun had set total darkness would follow, as quickly as if a candle were blown out in a dark room. Mr. Aitken has shown that when the atmosphere contains a very large number of suspended particles of extremely small size, *i.e.* fine dust, the sky at sunset becomes so luminous that a prolonged twilight occurs and beautiful sunset effects are seen. This was observed in the great volcanic eruption at Krakatoa, when quantities of fine dust were ejected into the atmosphere and drifted over the Continent of Europe and the British Isles.

There is another way of ridding the air of dust which has been the subject of a good deal of experiment by Sir Oliver Lodge. That is the discharge of electricity from a point; even a small electric machine can quickly clear a large bell jar of a cloud of smoke or dust by discharging its electricity from a point in the bell jar. Possibly at some future date the atmosphere of smoky and foggy towns may be rendered clear by continuous and powerful electric discharges. The coating of dust over the leads of electric wires is often noticed, especially in the flexible wires which suspend incandescent electric lamps. This is simply an effect of electric attraction on the dust in the air, a larger quantity of dust accumulating on that lead which has the higher electric potential.

But I must not pursue this interesting subject of dust any further. It has already afforded a wide subject for study having many practical applications, but the subject is far from exhausted; we have still much to learn concerning the phenomena associated with it. In conclusion, allow me to thank you for your attention to this lengthy paper, which has been somewhat outside your usual scope.

ROYAL SOCIETY OF IRISH ANTIQUARIES.

THIS Society is to hold its next quarterly meeting at Belfast, and it will, with the various excursions, occupy the week commencing on July 3. On that day the members visit the Giant's Ring, and in the afternoon they assemble at a garden party given by the Lord Mayor, the Right Hon. Sir Daniel Dixon, Bart. They afterwards have their annual dinner at the Grand Central Hotel. Tuesday morning will be occupied by an excursion to Templepatrick, Donegore and Antrim, and in the evening the Society will hold their meeting in the council chamber of the City Hall, by permission of the civic authorities. The election of candidates for Fellowship (3) and Membership (14) will be held, and no less than nine papers are to be read on that and Friday evening. At the former the president, Mr. J. R. Garstin, D.L., F.S.A., will preside, and at the latter the senior vice-president. On Wednesday the antiquaries visit Dundrum and Downpatrick, lunching at the Slieve Donard Hotel, Newcastle. Thursday, from 9.15 to 8.35, will be occupied by the journey to Portrush, and thence by electric tram to Dunluce and the Giant's Causeway. On Friday Carrickfergus, Larne and Ballygally are to be visited, and an evening meeting will be held. Saturday is to be devoted to the sights of the city.

A Large Marble Monument, in memory of the late Pope Pius IX., is to be erected in the cathedral of Sinigaglia, his native place. The monument is the work of Lorenzo Cozzas, the Italian sculptor.

TESSERÆ.

Sir Reginald Bray, Architect.

THE master of works at St. George's Chapel, Windsor, towards the end of the fifteenth century, and to whom the design of the chapel of Henry VII. at Windsor is sometimes attributed, Sir Reginald Bray, K.G., also superintended the renovation of Malvern Priory Church. He was said to have been born at Malvern. It is believed, however, that he first drew breath in the parish of St. John, Worcester, about the year 1424. In addition to his skill as an architect, he shone also as a statesman and a soldier. He bore an important part in promoting the success of Henry VII., and was made knight banneret by that monarch for his gallant conduct in the battle of Bosworth Field. Afterwards he was appointed constable of Oakenham Castle, Rutland, and chief justice, with Lord Fitzwalter, of the forests south of the Trent, &c. He had also a grant for life of the Isle of Wight, at a low rental. This distinguished patron of the arts died on August 5, 1503, and was interred in St. George's Chapel, Windsor, where his coffin was seen exposed in 1740, under the stone which covers Dr. Waterland. His portrait remains in the windows of Jesus Chapel, Malvern. "He was a verie father of his countrie," says Holinshed, "and for his high wisdom and singular love to justice, well worthie to bear that title. If anie thing had been donne amisse contrarie to law and equitie, he would, after an humble sorte, plainlie blame the kinge, and give him good advertisement that he should not only reform the same, but also be more circumspecte in anie like case."

Time in Figure Painting.

In great historical paintings the single moment which is supposed to measure the time of the enactment of the event is almost always extended. There is scarcely any picture which contains many figures in which every one of them is in the same posture in which he would have been at the moment of the action. Some appear as if they were earlier, while others are later, that is when compared with the principal figures. This liberty the artist endeavours to rectify by bringing some of his characters forward, while others are placed in the background. The remarks of Mengs about the draperies of Raphael will explain the effect which change of position has had on them. "There is a cause," he says, "for all his folds, either in their own weight or in the motion of the limbs. We can often tell from them how they have been before. Herein Raphael has even sought to give significance. We can see from the folds whether a leg or arm previously to its movement was in a backward or forward posture; whether a bent limb had been, or was in the act of being, strengthened, or whether it had been straight and was being contracted." In such a case the painter combines two different motions in one. For, as that part of the drapery which rested upon the hinder foot would, unless the material were very stiff and entirely unsuitable for painting, immediately follow the foot in its motion forwards, there is no moment at which the garment can form any other folds than those which the present attitude of the limb requires; and if it is made to fall in other folds the limb is represented at the present moment and the drapery at the one previous to it. Yet in spite of this who would be punctilious with the artist who has seen good to present us with both these moments at once? Who would not much rather praise him for having had the understanding and courage to fall into a slight error for the sake of allowing greater perfection of expression?

Inigo Jones's Designs.

The design of Ashburnham House has been denied to Inigo Jones and claimed for Webb; that of the water gate of York House has been claimed for Nicholas Stone. For evidence of these and other works ascribed to Jones recourse must be had to the collection of this architect's drawings formerly in the possession of the Duke of Devonshire, and of Worcester College, Oxford. These, with some drawings for Whitehall in the British Museum, and a few drawings on vellum of the same subject in the library of Windsor Castle, comprise all the known collections of Jones's designs. By some singular fatality they contain scarcely anything which can certainly be referred to buildings known or believed to have been actually carried out by Jones. Drawings, indeed, of the banqueting-house, a part of the projected palace of Whitehall, are frequent; but one finds no large-scale drawings of the banqueting-house itself; nothing of Shaftesbury House, nor of Ashburnham House, of Lindsey House, of the adjoining houses on the west side of Lincoln's Inn Fields; nothing of the chapel of

Lincoln's Inn, nor of the Piazza, Covent Garden. The designs (at Worcester College) for the portico of St. Paul's Cathedral and for St. Paul's, Covent Garden, are not those which were carried out. The latter, indeed, mentioned by Peter Cunningham in his "Life," could not be identified. Of York House there are known only, at Worcester College, a richly-gilt drawing, unlike any other known drawing of Jones's, for, or more probably from, a ceiling which can be allotted to York House by the appearance on the design of the Duke of Buckingham's motto. At Devonshire House there is a drawing comprising a plan and elevation of the water gate, the date on which, 1641, forbids us to accept it as anything more than a drawing from the executed work. Of Wilton House there are only, in the two collections, designs of singular beauty for ceilings; of the theatre of Barber Surgeons' Hall and of Somerset House there is only a small ground plan of the former. These blanks design that the acceptance and execution of a design involved the destruction of the original drawings, for though Jones's drawings have been divided, dispersed, and perhaps in some considerable measure destroyed, it would appear that something more than coincidence is necessary to account for the remarkable deficiencies cited above.

Nonsuch House.

The most remarkable building upon London Bridge after the chapel was the famous Nonsuch House, which, from the arms over the archway, appears to have been of the Elizabethan age, and, from other circumstances, to have been erected here a short time prior to the year 1585. This singular and very curious building was constructed in Holland, entirely of wood, and being brought over, was put together with wooden pegs only, not a single nail being used in the whole fabric. It stood to the north of the drawbridge, over the seventh arch from the Southwark end of the bridge, overhanging the river on each side. At each of its corners was a square tower, crowned with a Kremlin spire, and in the centre a rich, elaborately carved gable. It was four storeys in height, the whole was richly ornamented with carved panels and gilded and jasper-coloured columns. In the front was a profusion of transom casement windows, with carved wooden galleries before them. Over the archway, which was the width of the drawbridge, were placed the arms of St. George, the City of London, and those of Elizabeth, viz. France and England, quarterly, supported by the lion and dragon.

GENERAL.

Mr. John Tweedale, F.R.I.B.A., of Leeds and Harrogate, architect, late of the firm of Messrs. Smith & Tweedale, of South Parade, Leeds, who died on May 11 last, aged fifty-one years, left estate of the gross value of 34,014*l.* 4*s.* 7*d.*

Mr. Spenlove-Spenlove's picture *Too Late* has been bought by the French Government for the Luxembourg Gallery. This is the second work of the artist which has been thus honoured, his *Funeraillles dans les Pays-Bas* having been purchased in 1901.

The Arch of Septimius Severus, Rome (A.D. 204), which has been undergoing repairs for the past two years, will very shortly be out of the workmen's hands. Water had made its way through the top of the arch into the interior.

The Gallery of prints and drawings at the British Museum, which has lately been closed for alterations, will be reopened to the public to-morrow, July 1, with an historical exhibition of mezzotint engravings, selected for the most part from the collection bequeathed by the late Lord Cheylesmore.

The Governors of the Glasgow and West of Scotland Technical College have approved the appointment of Mr. G. Moncur, B.Sc., A.M.Inst.C.E., as lecturer in civil engineering, at a salary of 250*l.* Mr. Moncur was a graduate of Edinburgh University, served his pupillage under Mr. R. Blackadder, C.E., Dundee, has held positions under the Caledonian Railway Company, and since 1900 has been chief assistant engineer on the Great North of Scotland Railway, in charge of the design and erection of constructional work. There were seventeen applicants for the position.

After a Lapse of 365 years a service was held on Saturday in the ancient crypt of St. John's Church, Clerkenwell, which was built in the twelfth century by the Knights of St. John of Jerusalem. The place was lighted by electricity.

M. Henri Turot has ascertained that 72,705 families, containing 331,976 persons, in Paris, or 14 per cent. of the population, are insufficiently lodged.

The League of American Artists have opened an exhibition of their paintings at 334 Rue Saint-Honoré, Paris.

"La Société Centrale des Architectes" have awarded the Prix Dijean, of the value of 2,500 francs, to M. Eugène Hénard, and the biennial Prix Délarue of 1,540 francs to M. Lapeyrière.

Mr. H. T. Hare has been successful in the limited competition for the central public library in Islington. The assessor was Mr. John Belcher, who reported that "the design provides in a simple and effective manner a scheme which will be found to work satisfactorily in practice. The departments are well arranged and the whole building thoroughly well lighted. The elevations also represent a building suitable to its purpose." All the designs are described in the report as being of high quality.

Mr. Arthur S. Cope, A.R.A., has received a commission from the Corporation of Glasgow to paint two portraits of Lord Provost St. John Ure Primrose, Bart.—a full-length for the Corporation Galleries and a half-length for presentation to Lady Primrose.

Portraits are to be obtained of the late Aldermen Claude E. Egerton-Green and James Wise, which are to be hung in the town hall as memorials of their services to Colchester.

The Marylebone Borough Council have decided to oppose the Architects' Registration Bill, although the legal and Parliamentary committee advise to the contrary.

The Selected Design in the competition for a secondary school at High Wycombe to accommodate 175 pupils has been submitted by Mr. A. T. Greenwood, Manchester. Second and third places were awarded to Mr. C. H. Norton, London, and Mr. F. W. Mee, Manchester, respectively. There were sixteen designs submitted. No premiums were offered. Mr. Vernon was assessor.

Excavations have been in progress since February, under the direction of Mr. James Curle, near Newstead, Melrose, in a Roman camp which, so far as is known, is the largest in Scotland. From the trenches which have been cut the camp is believed to be at least 14 acres in extent, as compared with Castle Cary (2½ acres), Birrens, Dumfriesshire (about 4 acres), and Camelton (under 6 acres).

The Glasgow Corporation have opened a permanent museum in the mansion house in Tollcross Park at the east end of the city. The main purpose of the institution is to assist the education of the young by the formation of a children's museum. The museum now contains a collection of current Scottish art, near 200 pictures having been lent.

The Junior Institution of Engineers, founded in 1884, celebrate this week in London their coming of age. The Institution, which has now a membership of about one thousand, inaugurated its celebrations on Monday by a reception in the City Council chamber of the members and friends of the Institution by the Lord Mayor and Sheriffs of the City. The president of the Institution is Mr. W. H. Lindley.

The Panama Canal Commission will hold a meeting in New York of their consulting board on September 1. The engineers in charge have reported that it will be impossible to continue on the lines of the plans drawn up by the previous Panama Commission.

A Large Stone Battle-axe has been unearthed between Gainford and Ingleton, six miles west of Darlington, whilst some workmen were cutting a drain, two or three feet from the surface. The implement on examination was found to be an ancient British battle-axe made of millstone grit. The axe weighs 4 lbs. 1¼ oz., is 7¼ inches long and 4 inches wide at the head and 2½ inches thick along its whole length. The shape is roughly triangular, almost exactly that of a heater for a domestic box-iron, with a circular hole for the shaft of the axe 1½ inch in diameter. Its greatest circumference is 18¼ inches, and the circumference at the shaft-hole 11¼ inches, the axe tapering to a sharp cutting point. The soil in which the weapon was found is of a peaty nature, largely impregnated with iron, and the edges of the axe have suffered very little from erosion.

The "Technolexicon" of the Society of German Engineers, according to a short report on the state of work in the compilation of the universal technical dictionary for transla-

tion purposes (in the languages English, German, French), was commenced in 1901. About 2,000 firm individual collaborators at home and abroad are assisting present. Up to now 2,700,000 word-cards have been collected. To these will be added the hundred thousand cards that will result from the working-out of the original contributions not yet taken in hand. The contributions been called in since Easter 1904, and most of them already arrived (up to June 1905, 1,480). The editor-in-chief will be pleased to give any further information wanted. Address, "Technolexicon," Dr. Hubert Jaeger, Berlin (NW. 7), Dorotheenstrasse 49.

A Special General Meeting will be held at the Institute of Architects on July 3 to discuss the following amendments. Clause 14 to read as follows:—"In all works requiring an estimated sum of 25,000*l.* and upwards three assessors to be appointed, unless there are insurmountable objections. As stated above, the President of the Royal Institution of British Architects is always ready to advise on this or other points." The clause as to scale of charges in the original draft to be reinstated in the following form:—"The R.I.B.A. scale of charges for assessing competitions is the minimum rate of 30 guineas plus one-fifth per cent. upon the estimated cost of the proposed building."

In the City of London Court Mr. W. R. Pether, civil consulting engineer, 6 Dowgate Hill, sued Mr. and Mrs. Whitlock, Clapham, for five guineas, being fees for services as a witness. Mrs. Whitlock was injured by electric lamp falling upon her when she was walking in front of a shop at Brixton. An action was brought to recover damages. The plaintiff was then employed as a professional witness, and he gave evidence at the Lambeth County Court. The plaintiff now claimed to be paid for services. He had received a guinea, and that was all the County Court could allow him. Judgment was entered for the plaintiff for the amount claimed, with costs.

An Interesting Discovery was made recently at Worcester in the course of the removal of earth in connection with the excavation near the sinking part of De Luce work, at the eastern end of the cathedral. It was a metal brooch, having in its centre a representation of the devotion on a silver penny of Edward the Elder, the surrounding space being decorated with a dotted pattern. It was clearly worn as a brooch, for the position of the acus, or pin, and its receptacle are evident. Mr. J. B. Colson, the architect of the Chapter, has sent it for description to the British Museum. The find is valuable as affording some information as to the coins and moneyers of Edward the Elder, and a paper will be read on it before the Numismatical Society in November.

A Baby may invalidate the city seal of Chicago and thus render illegal all official documents to which the seal has been attached since it was altered by a city ordinance on April 15. The baby that has caused all the trouble, says the *New York Tribune*, is the "infant sleeping in a shell" provided by the ordinance as the design for the seal. The whole question hinges on the posture of the infant and on the construction of the word "sleeping." The authorities have discovered that the "sleeping" infant in the shell is seated upright with legs crossed and dangling over the edge. Experts assert that no babe can sleep in such position. In addition to the problem of whether the official business of the city has been legally approved by the new seal is the question of whether 2,000,000 dols. worth of bonds to be issued by the Controller in October will be worthless if they bear the new impression.

An Agitation is being raised in New York against the new rapid transit subway, on the ground that the air is highly dangerous to the public health. Owing to the large number of people seized with faintness the city authorities have established relief offices with medical attendants at the most frequented stations.

The Belgian Parliament have already prolonged the session for over a month in order to settle the question of the port improvements at Antwerp. It is said that an adjournment will not take place until the matter is disposed of. The Government in presenting the Bill have joined to the plan for port extension a great military scheme for the reconstruction of the fortifications of Antwerp. In order to realise the port extension the present earthwork fortifications have to be completely demolished, so that the vote for port extension will carry with it the necessary credit for the reconstruction of the line of fortifications. This proposal is, however, being strongly opposed.

THE

Architect and Contract Reporter.**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** * As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

THE CAMPANILE AT VENICE.

WHILE the church of San Marco is causing anxiety because of the cracks which have appeared in it, the work of re-building the fallen Campanile is slowly proceeding. Nearly two years and a half have elapsed since the building fell, and it is calculated that four more years will be needed for its reconstruction, the cost of which is estimated at 2,000,000 lire (80,000*l.*), the whole of which has now been assigned for the work. Great care is being taken that the new tower shall be as solid and substantial as possible. Round the old foundations there have been placed 3,000 stakes of larch more than 10 feet in length, fastened together and covered with a coating of cement so as to form a second foundation. Venetian and Istrian stone as well as cement are being employed for this purpose. Roman pozzolana, the strongest and most binding kind of mortar (according to Signor Boni, who points to the great durability of the Roman monuments in proof of this statement), will be used in the construction of the new tower; but the famous *loggetta*, which stood at its foot and was built by Sansovino as a meeting-place for the nobles of the Republic in 1540 will be reconstructed out of the old pieces, religiously preserved on the island of the Giudecca. It is calculated that the total weight of the Campanile will be 12,000,000 kilogrammes (12,000 tons).

THE preliminary steps are already far advanced in Paris towards the execution of the Rothschild project for erecting cheap working-class dwellings on a large scale. Three properties are being acquired at a cost of 46,000*l.*

TENDERS FOR THE YEAR 1904.

THE following are a few of the more important works that were estimated for during 1904, the tenders for which appeared in our columns in the course of the year :—

ACTON.

For the erection of the Southfield Road school, for the education committee of the Acton Urban District Council. Messrs. E. C. P. & H. MONSON, architects to the committee, Acton Vale, W., and 22 Buckingham Street, Adelphi, W.C. Quantities by Mr. F. T. W. MILLER, Dartmouth Street, Queen Anne's Gate, S.W.

THE preliminary arrangements are now practically completed for starting operations in connection with the Loch Leven water-power factories, and it is stated that the work will be actually in the hands of the contractors early in spring. A large number of workpeople will be employed. An important feature of the undertaking will be a huge concrete wall, three-quarters of a mile in length, 80 feet in maximum height and 50 feet in thickness at the base. The purpose of this structure will be to dam up the waters of Loch-an-Iubhair and the other tarns on the Blackwater range. From this wall a concrete canal, 4 miles long, will be formed. The conduit, which will have a very slight gradient—not more than one in a thousand—will terminate in a reservoir dug out of the rock in the rugged hills of Kinlochbeg, and from this immense pond the water will be discharged in a direct fall of 800 feet or 900 feet to the aluminium works beneath. The cost of parliamentary and other professional work connected with the scheme already amounts to about 40,000*l.*

URALITE for THEATRES, MUSIC HALLS, MAGIC LANTERNS, CINEMATOGRAPHS, &c.

R. S. CAHILL, Esq., F.C.S., writes:—

Higher Grade School and School of Science, Heckmondwike : December 15, 1903.
Dear Sirs,—I discovered URALITE some time since, when I was in search of some substance of which to make the body of a Lantern to use with an Arc Light. I got several square yards, and have made a most satisfactory lantern arrangement with it, and at comparatively little cost; this does not heat, and answers admirably.

I have also used URALITE for mounting iron wire resistances with good results.—Yours truly,

(Signed) R. S. CAHILL.

THE BRITISH URALITE COMPANY, LIMITED,
50 CANNON STREET, LONDON, E.C.

NOTE CHANGE OF ADDRESS.

THE GAIETY THEATRE,
GAIETY RESTAURANT,
AND SHORT'S NEW PREMISES
IN THE STRAND IMPROVEMENT SCHEME.

The Carving of the Central Figure on the Dome and other Work, both Exterior and Interior, and the Frieze round the Restaurant and Short's, were entrusted by the Architects to

MR. HIBBERT BINNEY,

Whose address is now 4 ST. JOHN'S WOOD STUDIOS, Queen's Terrace, London, N.W.

BUILDING AND BUILDERS.

THE building committee of the Western College, Bristol, have recommended that the erection of the new buildings on the site already acquired by the trustees be begun forthwith.

MR. CARNEGIE having advanced 2,000*l.*, a free library is to be erected at Balbriggan, near Dublin. The committee decided to entrust the work to Mr. Heeney, of Balbriggan. The plans have been prepared by Mr. J. L. O'Connor, Dublin.

THE health committee of the Eccles Corporation have approved the plans prepared by the borough engineer (Mr. Acton) for the laying-out of land in Lewis Street, Patricroft, where it is proposed to erect workmen's cottages to provide accommodation for the people who have been disturbed by the demolition of houses on the insanitary area. Plans and estimates are being prepared.

SIR WILLIAM ARROL & Co., LTD., Glasgow, have received from Messrs. M'Kie & Baxter, engineers and shipbuilders, Copland Works, Govan, an order for an extension of the works, which involves the doubling of the erecting and machine shops, the building of a new smithy, new pattern shop, store and finishing shop, and entirely new commercial and drawing offices.

THE Associated Building Trades of New York, a Society which is newly constituted and has a membership of 80,000 workmen, declares that it shall be "the special duty of this body to use the united strength of all trades represented herein to compel all non-union men to conform to and obey the laws of the trade to which they should properly belong, and if necessary all affiliated trades shall, on a two-thirds vote of the body, cease work; any trade refusing to comply shall be fined 500 dols."

THE records of the Ayr Dean of Guild Court show that during the current year there has been a very large amount of building in the town. The total approximate value of the new buildings passed by the Court is 106,680*l.* This is rather under the total of last year; but while this year applications did not include practically a single building or public work, last year there were several, including a large new school, a bank, reconstruction of theatre and destructor works. This year's building consists almost exclusively of

dwelling-houses, the large proportion of which are villas of various sizes.

In the Edinburgh Sheriff Court a mason brought a claim against P. & J. Gilhooley, contractors, for 500*l.* at common law, or alternatively for 312*l.* under the Employers' Liability Act, as compensation for injuries received on April 11, 1904. While working as a mason in defendants' employment, the plaintiff had his left eye injured by a splinter from a glazed drain pipe, and the action was raised in consequence. The Sheriff has found that the plaintiff failed to fix liability for his injury upon the defendants either at common law or under the provisions of the Employers' Liability Act. He therefore assuozied the defendants, and finds them entitled to expenses.

ST. HELEN'S HOSPITAL at Peasley Cross was reopened on Dec. 30 after enlargement at a cost of 20,000*l.* The extensions are built of brick and stone in keeping with the old portion of the building. The additions include a new main corridor about 130 feet long and new ward accommodation for twenty beds downstairs, and a similar number upstairs. A new nurses' home has been erected, with dining-room, drawing-room, matron's and sisters' room, kitchen and bedroom accommodation for twenty-two nurses. At the end of the corridor an operating theatre has been provided, lined with marble, with up-to-date utensils, and outside a new steam laundry has been erected. The old portion of the building has been entirely remodelled to provide an accident ward and children's ward, and the existing wards have been extended by four beds.

MESSRS. MATHESON & GRANT, Walbrook, London, in their annual trade review say:—After a time of doubt and depression the New Year opens with many indications of reviving trade. There has been a marked absence of labour disputes. In South Africa the available spending money, which was so largely reduced by the closing of the mines, is steadily increasing, and if the present conflict in the East can be confined within its present limits the iron and engineering trades must benefit. No new enterprises are possible without them. With regard to structural steel-work, it is said the railway companies are all restricting their expenditure on renewals and extensions, but the work on bridges and stations that cannot be postponed has

afforded a fair amount of employment during the past year. The use of steel in buildings is growing, but the designers endeavour in the use of beams and sections to leave a minimum of work after the steel is rolled.

A NEW Council school was opened in Harehills Lane, Leeds, on December 22, of which the total cost will be about 21,210*l*. The buildings are in two blocks, the larger block facing to Harehills Lane having been arranged for senior and junior mixed children. The larger block is two storeys in height, and provides accommodation for 480 junior children on the ground floor and 480 senior scholars on the first floor. The infants' school is a separate building, and is only one storey high, accommodation being provided for 560 children. Three assembly halls are provided—one for each department—and classrooms are arranged round the halls. There are twenty-six classrooms in all. Two fireproof staircases are provided for the upper floor of the mixed department. One classroom is specially fitted up for cookery instruction. The buildings throughout are electrically lighted, amply ventilated and well heated. There are also spacious concreted playgrounds. The buildings have been designed under the direction of the architect, Mr. W. S. Braithwaite, architect to the education committee.

PONTRILAS COURT, Herefordshire, has been remodelled for Colonel Lucas Scudamore. The old drainage system has been entirely removed and replaced by a system carried out upon the best modern principles. The question of sewage disposal has received very careful consideration by the architects. The septic treatment being finally decided upon as being the best in this case, the necessary septic tank and filter beds have been laid down at a considerable distance from the residence. The whole of the sanitary fittings have been replaced and brought up to date. The water supply has been augmented, a new reservoir having been built and the water conveyed therefrom to the residence by means of galvanised water-tubes. A complete installation of acetylene gas has been laid down, the generator used being supplied by Messrs. Thorn & Hoddle. The heating of the residence has been carried out by means of radiators, the heating medium adopted being low-pressure hot water. The sanitary work, water supply, heating and

general work have been carried out by Messrs. Beavan & Hodges, of Hereford, and the decorations and acetylene gas installation by Mr. J. C. M. Vaughan, of Hereford, the whole being carried out according to the drawings and specifications and under the supervision of Messrs. Groom & Bettington, architects and surveyors, of Palace Chambers King Street, Hereford.

VARIETIES.

THE London Chamber of Commerce, in its annual trade review, says:—"With regard to the future signs are not wanting of hope and encouragement. The general impression seems to be that we have 'touched bottom' and that the new year will show a steady improvement. At home there are indications of a recovery from the trade depression of last year, which will probably be assisted by an increasing South African gold yield."

A PARLIAMENTARY return issued on Tuesday shows that during the year ended March 31 last the school boards of England and Wales received sanction for loans amounting to 1,619,719*l*.

THE Berwick Sanitary Authority are to engage an expert to value the present Berwick waterworks, in view of the proposal for an enlarged joint water scheme for Berwick, Tweedmouth and Spittal.

A USEFUL little work is issued by the Master Builders' Association, entitled the "Diary of the London Master Builders' Association," and is published by Messrs. Unwin Bros., of Pilgrim Street, London, at a charge of 2*s*. 6*d*. per copy.

MR. STAFFORD HOWARD, commissioner of Woods and Forests, is considering the advisability of admitting a limited number of working woodmen from twenty-one to twenty-five years old into the new School of Forestry, Forest of Dean.

THE military authorities are erecting a sewage farm in the marshes below Gravesend, and have undertaken the necessary works at the Gravesend Fort. This action will be followed by the introduction of a system of main drainage in the town itself.

THE housing committee of the Liverpool Corporation recommend that 44,000*l.* should be placed at their disposal for the purchase of land and erection of dwellings under the Housing of the Working Classes Act. They also recommend that 7,850*l.* be paid over on artisans' dwellings ordinary account.

THE London Road Car Company, Limited, have issued at par 19,334 shares of 6*l.* each, for the purpose of providing and equipping new motor road cars and adapting the company's depôts to the altered conditions under which the traffic is proposed to be carried on. The list closes on the 10th inst.

THE Local Government Board have informed the Scarborough Corporation that it will be necessary to call a public meeting or take a poll of the town before they will be empowered to borrow additional money—about 20,000*l.*—for the completion of the new Marine Drive and south approach road. The total cost of the undertaking will be something like 100,000*l.*

A GARDEN village trust has been established by Mr. Joseph Rowntree, with the object of providing about forty dwellings for the working classes at Earswick, West Huntington, near York. The proposal is to erect houses which shall be artistic, sanitary and thoroughly well built, at rentals of about 4*s.* 6*d.* per week. If the experiment is to be a useful contribution to the housing problem, it is felt there should be a business return on the capital.

THE Irish Lights Commissioners invite tenders for the erection of a number of dwelling-houses for the men engaged in looking after the lighthouses at Slyne Head, co. Galway, and Ferris Point, Larne Harbour, co. Antrim. It is intended in each case that the buildings to be used as shore-dwellings shall consist of one block of four residences, and that they shall be provided with all necessary fittings, out-offices, boundary walls and rain-water tanks.

THE Irish Roads Improvement Association have distributed nearly 2,000 copies of a booklet on "Economical Steam-Rolling of Irish County Roads," by Mr. E. A. Hackett, county surveyor, Tipperary, to all the county councillors in Ireland, and to the urban and district councillors of Ulster. It has now been decided to send copies to all the surveyors

and assistant-surveyors in Ireland. Mr. P. C. Cowan, Local Government Board inspector, will be invited to write a pamphlet on Irish roads for distribution.

THE finance committee of the Hull Corporation at a meeting on Friday criticised the expenses of deputations. One member particularly referred to the charge of two guineas each for an afternoon at Leeds, and to eight or nine members going on one deputation. A return is to be presented, showing the amount received by each member as deputation expenses during the last five years, and also the amount by corporations of towns of similar size.

THE Chapel-en-le-Frith District Council have received the sanction of the Local Government Board to expend 28,000*l.* in the purchase of the three waterworks at Dove Holes and Chapel-en-le-Frith and the construction of works for Chinley and Bugsworth. The district will then be properly supplied, all the undertakings of local companies having been bought up by the local authority.

THE North-Eastern Railway Company some time ago declined to allow the Scarborough Corporation to place boards advertising the town in the principal stations on the company's line. The Corporation in return refused to permit the company's advertisements on town property. The Corporation have now, in response to a letter from the company, instructed the town clerk to inquire whether the directors had yet thought more favourably of the Corporation's previous request.

MESSRS. WM. BEARDMORE & Co., in pursuance of their resolve to provide housing accommodation for their workmen in the vicinity of their new shipbuilding yard at Dalmuir, have applied for "lining" for a first instalment of thirty-seven three-storey tenements, with shops on the ground floor. Thirty-four of this number will consist of one-room and kitchen houses, and the others of superior two-room and kitchen houses, with all modern preliminary furnishings and improvements. The value of the lining, which was granted, is 100,000*l.* These houses will accommodate 400 families, and the firm purpose erecting in the near future, on ground near to the N.B. station, a second instalment of their housing scheme, to give accommodation for at least other 700 families.

ARTHUR L. GIBSON & CO., 19, 20 & 21 Tower Street, Upper St. Martin's Lane, LONDON, W.C.

In the Liverpool Court of Passage on Tuesday a claim for damages by a window cleaner was heard. The plaintiff, in leaving a bedroom window which he had cleaned to gain access to his ladder, placed his hand upon a stone ornament on the portico of the door for the purpose of steadying himself. The ornament gave way and the plaintiff fell to the ground beneath, causing injuries which kept him out of employment for eight weeks. He claimed 39*l.* 17*s.* 8*d.* from the occupier as expenses, and also sought damages for pain and suffering. He estimated the net profits of his work at 2*l.* a week. For the defence it was contended that the plaintiff had made an undue use of the stone ornament, and the defendant was not liable. In what way, counsel asked, had defendant shown negligence? The jury found for the defendant, judgment being given accordingly.

The Malvern District Council have considered a report in regard to augmentation of the water supply from Mr. Whitaker, of Croydon, expert geologist. It was declared to be inexpedient, under present circumstances, to deepen the borehole from which the main supply is at present drawn, and suggested a new borehole in another part of the district. This would, however, be only a temporary expedient, and as the population increased it would be necessary to look further afield for a constant large supply. The New Red Sandstone at the southern range of the Malvern range of hills was the best source, and should yield a supply sufficient for Malvern and for other places near. It was decided to at once proceed with the opening of another borehole on land near to Malvern Common.

SIR OLIVER LODGE recently lectured at the Birmingham town hall on "Water, Wind and Weather." Dealing more particularly with fogs, the lecturer showed how electricity discharged into a steam cloud produced rain, and on the question of curing town fogs, remarked that there ought to be improved methods of combustion. Crude coal should not be allowed to be burnt in cities; it should be distilled into its constituents. The asphalt should be saved, and the coke separated and used instead of coal. The gas should be purified and supplied in large pipes to cities for daily consumption, not so much for lighting—though it might be used for lighting by mantle—but for heating and cooking purposes. He saw no reason, except governmental

or municipal reasons, why this should not be done, and when it was done cities would become clean and healthy places to live in.

A DETAILED statement of the cost of the rating arbitration between the North-Eastern Railway Company and the York Union assessment committee has just been issued to the Guardians of the Union. The costs of nine expert witnesses were as follows:—Messrs. Ryan, 2,000*l.* 8*s.* 2*d.*; Barker, 1,746*l.* 5*s.* 10*d.*; Wellsted, 1,268*l.* 14*s.* 10*d.*; Turner, 1,064*l.* 14*s.*; Severne, 873*l.* 10*s.* 6*d.*; Moore, 851*l.* 12*s.*; Wells, 687*l.* 5*s.* 2*d.*; Sanders, 540*l.* 1*s.* 1*d.*; Hirst, 365*l.* 6*s.* 11*d.*; total, 9,397*l.* 18*s.* 6*d.* The fees of the nine counsel engaged in the case were:—Messrs. Castle, K.C., 774*l.* 5*s.*; Ryde, K.C., 755*l.* 1*s.*; Marshall, K.C., 643*l.* 1*s.* 6*d.*; Compston, 162*l.* 10*s.* 6*d.*; Taylor, 141*l.*; Kershaw, 99*l.* 17*s.* 6*d.*; Mellor, 76*l.* 17*s.* 6*d.*; Kemp, 52*l.* 17*s.* 6*d.*; Bradbury, 23*l.* 10*s.*; total, 2,728*l.* 10*s.* 6*d.* The remaining items are as follows:—North-Eastern Railway costs, 7,684*l.* 18*s.* 6*d.*; Allvey (accountant), 3,894*l.* 16*s.* 2*d.*; Castle & Son (valuers), 2,861*l.* 19*s.* 11*d.*; printing, 566*l.* 1*s.* 2*d.*; shorthand notes, 434*l.* 2*s.* 5*d.*; personal expenses, 195*l.* 19*s.* 7*d.*; London agents to solicitors, 180*l.* 7*s.* 10*d.*; arbitrators, 74*l.* 10*s.*; taxing master, 48*l.* 3*s.* 4*d.*; Westminster Palace Hotel (use of rooms), 30*l.* 18*s.*; commission on cheques, 11*l.* 8*s.* 6*d.*; grand total, 30,929*l.* 15*s.* 11*d.*

COLONEL A. J. HEPPER, R.S.E., has held an inquiry at Derby into an application made by the Corporation for the issue of a provisional order to partially repeal or alter the Derby Corporation Act, 1901, so as to extend the time allowed for the completion of the sewerage and sewage disposal works authorised by the Act. The inspector remarked that when application was first made for powers, the Corporation asked for ten years, but as Parliament had only granted four, the Local Government Board would have to be very careful how the allotted period was extended. Mr. Walter Mansergh, in giving evidence as representative of the engineers, said that contract No. 1 was for the laying of 14,850 lineal yards of sewers. The order to commence was given the contractors in June 1902, and the time allowed was two and a half years. The accepted tender amounted to 131,464*l.*, and up to November 24 last the value of the work done was 92,924*l.* Con-

tract No. 2 for treatment works was let for 85,473*l.*, and was to be finished in June 1905. The value of the portion that had been done up to November 24 last was 63,913*l.* Considerable delay had arisen in executing contract No. 3 for the supply of filtering material. The material originally selected for the purpose was honey-combed slag, but on the advice of Dr. Barwise, the medical officer of health for Derbyshire, and after conducting a series of experiments which showed that honeycombed slag had a tendency to disintegrate, another agent was decided upon. A difficulty was then experienced in obtaining any contractors who were willing to deliver this last material within a specified time. The contract amounted to 17,467*l.*, and 7,367*l.* had been delivered in position. Contract No. 4, to be completed in July, 1905, was for 16,435*l.*; and Contract No. 5 for pumping machinery amounted to 14,914*l.* With the exception of contract No. 3 all the contracts were let in time for completion within the statutory date, provided that no unforeseen difficulties arose. The number of men employed upon the works had been about 725, but in the middle of "the working season" the number had risen to 860.

ELECTRIC NOTES.

THE Commonwealth Electric Company of the United States are seeking a franchise for the installation of an electric lighting system in Philadelphia. A sum of 10,000,000 dols. has been guaranteed for that purpose.

THE Shrewsbury Town Council have sanctioned a preliminary expenditure of 508*l.* on extension works in connection with the electric lighting undertaking. The estimated cost of the further extensions will be approximately 5,295*l.*

PORT GLASGOW Town Council are considering the advisability of proceeding with a scheme whereby the town will be lighted by electricity. It is proposed to utilise the waste steam at the destructor for generating electricity, and also possibly to supply small works for power purposes.

THE Arbroath Town Council have entered into an agreement with the Empire Electric Lighting Company, Ltd., for the introduction of electric light. The company will com-

mence operations when they obtain possession of the site for the works.

THE South Wales Electrical Power Distribution Company recently entered into a provisional agreement with the Carmarthenshire Electric Power Company to take over all the powers conferred by Parliament in 1903 on the Carmarthenshire Company. The agreement is made subject to the consent of Parliament, and to three-fourths of the shareholders in both companies passing a special confirmatory resolution.

MR. A. T. SMITH, of Bury, has been recommended by the electricity committee of the Leigh Corporation for appointment to the post of electrical engineer, in the place of Mr. D. M. Kinghorn, who has been appointed electrical engineer of Southwark at a salary of 350*l.* per annum. Mr. Smith is to receive 250*l.* per annum, rising to 350*l.* by yearly increments of 25*l.* There were 147 applicants for the post.

MESSRS. DICK, KERR & Co. have shipped 250 tons of electrical machinery in connection with their contract for the complete equipment of the Tokio, Denki, Tetsudo and Kabushiki Company's Tramways. The installation of this tramway system, which when finished will cover over sixty miles of line and operate some 250 cars, is being carried out by Messrs. Dick, Kerr & Co.

TRADE NOTES.

THE additions to the borough sanatorium, Brighton, are being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves.

THE new Lyceum music hall has received general admiration on account of the excellence and style of the decoration, seating and upholstery. The credit for the whole of those classes of work belongs to Messrs. S. J. Waring & Sons.

MESSRS. WM. BIRCH, LTD., 370 Euston Road, N.W., were awarded at St. Louis Exhibition both the Grand Prize and Gold Medal for their extensive exhibit of furniture and cabinet-work. At a recent visit to their show-rooms we

were impressed with the excellence of design and workmanship alike shown in all their various departments.

MESSRS. ROTTMANN & Co., of 25 and 26 Garlick Hill, Queen Victoria Street, E.C., manufacturers of Japanese leatherpapers and English wallpapers, have just opened West End showrooms at 29 Mortimer Street, W. The City address, however, will continue to be the head office and warehouse.

MESSRS. ROBT. W. BLACKWELL & Co., LTD., who supply "Ruberoid," a valuable roofing material, and whose address is 59 City Road, London, are issuing a neat little memorandum book. The special feature in connection with it is the fact that only one page is occupied by the firm's announcement, giving useful information; the rest of the pages are for use, and not interleaved throughout with advertisement material of the firm's specialities, as is too often the case with manufacturing firms.

MESSRS. ARCHIBALD SMITH & STEVENS have issued a third edition of their "Notes on Electric Lifts." Although only a brochure of about forty pages, there are so many facts introduced, anyone who may be unacquainted with lifts will, after reading it, be in a position to understand the principles involved in the construction and working of aids which are every-day becoming more indispensable in cities and towns. Several illustrations of new machines by the firm are given.

We have received Calendars from the following well-known firms amongst many others:—The Limmer Asphalt Co.; the Silicate Paint Co. (Duresco), Jas. Duthie & Co., sole agents for Scotland and Ireland; Peckett & Sons (locomotive manufacturers, Bristol); the Willesden Paper and Canvas Works, Ltd.; Cooper & Budd; Kaye & Co. (Rugby); W. Potts & Sons (Leeds); McTear & Co. (Belfast); the Yost Typewriter Co.; the Falcon Brass Works Co., Merryweather & Co., Robert Boyle & Co., &c., &c.

We have received a price list of Sankey's perfect-draught chimney-pot. The special features claimed are that they are everlasting, simple, effective, and supplied at a particularly reasonable charge. The louvres in these pots are deeper, and openings are so made that the wind is caught from any quarter, causing a considerable up-draught in the chimney, and from the internal construction the possibility of down-draught is obviated. The manufac-

turers are Messrs. J. H. Sankey & Son, Ltd., of Essex Wharf, Canning Town, London.

A LARGE new clock has just been erected in the parish church, Hampton-on-Thames, which has four large dials and strikes the hours upon the tenor bell. It is fitted with all the latest improvements and is guaranteed by the makers to keep time with great accuracy. It will be a most useful clock, as it is so well seen from the river Thames. The work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby, to the designs of Lord Grimthorpe.

MR. VINCENT ROBERTS, heating engineer, of Cherry Row, Leeds, has recently secured the contract for heating and ventilating a large suite of new offices for the Aire and Calder Navigation, Ltd., Leeds, on the low-pressure water system; also new Corporation baths, Ripon, by low-pressure steam radiators. He is also just completing a large installation (heating and hot-water supply) for the Arthington Semi-convalescent Home, Cookridge, near Leeds. During the last two or three months he has carried out many hot-water heating installations for various places of worship, private residences, works and offices.

VICTORIA STONE.

THE remarkable adaptability of the Patent Victoria Stone to meet all requirements of form, construction or colour is exemplified by some of the works which were lately executed by the company, or are now in hand. With so many undertakings it is difficult to make a selection. But the following will serve to show how suitable the material is for external work, owing to its power of resistance against all atmospheric influences and the ease with which it can be procured in colours which will be adapted to each building.

At the new electric power station for the Brighton Corporation at Southwick the staircases are constructed of Victoria stone. It is also employed for the large cornices, sills, heads, rusticated ashlar, &c. The power station adjoins the gasworks. The stone will, therefore, be subjected to the gas fumes, in addition to its exposure to the destructive effect of the sea air, for the building stands in a very un-

sheltered position. A mansion at Ogmore Vale, South Wales, is in a colliery district. But Victoria stone was selected owing to the confidence that it would withstand all the resulting injurious influence. The Carnegie Library, Hartlepool, is another structure which occupies an exposed site. Externally it will be constructed of Victoria stone, and there is no apprehension that the sculptured panels and other carved work, which are in the same material, will have any of their sharpness or beauty diminished in the least degree. The air of Southampton is not easily withstood. But in the new tourist offices of Messrs. Cook at the corner of John Street and Oxford Street carved figures, elaborate ornamentation and enriched details have been confidently employed owing to experience of Victoria stone, which in this case is generally of the red Mansfield tint. It is also selected for the stonework of the Blind Institution, Nottingham.

In and around London a great many buildings are to be seen which from its employment externally will enable any passer-by to testify to the success with which Victoria stone resists the deleterious influences of the atmosphere. It is employed for the whole of the external architectural work in the new stables for Messrs. Macnamara, the carriers, in Hill Street, Finsbury. The tint is a brownish Portland. In a new warehouse for Mr. Sampson, Diana Place, Euston Road, a staircase in this stone is also worth inspection. The work is in a normal grey colour. The material has been extensively employed in several important blocks of mansions in Clarence Gate, Regent's Park. The Crown and Anchor public-house, in Neal Street, Long Acre, has been recently completed, the stonework being of a yellow Mansfield tint. It is being used for the Queen's Arms, Chelsea. Buildings of this class require to be attractive, and the stone lends itself to the most ambitious desires of the owners. At The Russells, Watford, the conservatory has been erected with pilasters, cornices and ornament in Victoria stone. For the new Carnegie Library at Hanwell, now in progress, a stone of a yellow Mansfield tint has been adopted, while for the Omega Road school at East Ham grey-coloured stone was preferred. For the Hampstead General Hospital a Portland stone tint was preferred for the external stonework, the capitals and enrichment to the porch

being carved. The staircases and other parts of the Municipal Buildings, Tottenham, exemplify its use in architectural work, where the buildings in connection with the destructor of the same district are evidence of its suitability for engineering works. It is also employed in railway works throughout the country.

It is satisfactory to find that a material in the production of which science as well as art are combined is meeting with such general favour. But when it is known to serve with equal efficiency for the paving of footways, or wherever traffic is heaviest, and yet can be utilised for delicate carving, and from its manner of production can be made subservient to all styles of architecture, the success of the Patent Victoria Stone is not surprising.

CARISBROOKE PARISH CHURCH.

By request Mr. Thackeray Turner recently inspected and reported upon the condition of Carisbrooke parish church, which has proved so attractive to visitors to Carisbrooke Castle. In his report Mr. Turner states that the church is a structure of great beauty, and the tower a very fine specimen of Perpendicular work. The building is in sound condition except the west wall of the porch. The tower is sound and strong, but the bells are hung in such a way that the strain and vibration caused by their ringing are beginning to produce cracks in the stonework, and he strongly advises an alteration in the hanging of the bells. He recommends various works of repair, the reglazing of all the windows except those of stained glass, and suggests the necessity for reseating and the removal of the organ and choir stalls from the west end to the east end of the church, so as to open out the tower arch and the west window. Mr. Turner's reference to the chancel question is specially interesting in view of the proposal made, but not carried out, for the restoration of the ancient chancel (which was pulled down by Walsingham to save cost of repair) as the Isle of Wight memorial to the late Prince Henry of Battenberg as Governor of the Island. He says that opening the chancel arch and building a chancel has

many objections. A new chancel would be a great disfigurement, graves would have to be disturbed, and, when built, the chancel would be very little use, for the chancel arch could not be more than 9 feet 8 inches in the clear, and to alter the arch would be out of the question. An effort is being made to carry out the necessary restoration work.

VALUES OF SITES IN MANCHESTER.

WHEN the question of taxing land values comes to be considered as practical politics it will not be difficult, says the *Manchester Guardian*, to show some astonishing examples of the way in which sites in Manchester have multiplied their value by a very substantial numeral in the course of a couple of generations. There was offered for sale recently a block of property in Market Street called Palace Buildings. The site carries an annual chief rent of 1,200*l.* and measures 800 square yards. A correspondent who has been delving into Manchester property records of 1774, tells us that a gunmaker in Market Street, named Aston, occupied premises on the site of Messrs. Derbyshire & Holmes's shops and had a garden behind the house stretching as far as Cannon Street. That site to-day produces an annual revenue beside which the full value of the property 130 years ago becomes insignificant. Aston thought the vendors wanted too much money when they asked him 800*l.* for the entire plot. The same correspondent supplies us with some other prices of land in Manchester seventy years ago, and these we are able to supplement with some highly interesting advances of values in more recent times, for which we are indebted to one of our best-known firms of land agents. When the Manchester improvement committee obtained an Act of Parliament in 1830 for various improvements they bought much land under compulsory powers—not, of course, the cheapest way of purchase.

But when we come to consider present-day prices the yardage paid seventy years ago seems very small indeed. For land in Market Street 7*l.* 10*s.* per yard was paid; for land in Cross Street, Pool Fold, King Street and Fountain Street 5*l.* per yard; at Smithy Door 8*l.*, at the corner of Todd Street and Long Millgate 5*l.* 13*s.* Land in Deansgate,

near St. Mary's Gate, fetched 4*l.* a yard, and land occupied by property extending down Smithy Bank from the corner of Cateaton Street to the river 4*l.* 7*s.* 6*d.* per yard. The highest price paid at that time was 9*l.* per yard for a plot of land in Parker Street. In the Parsonage the price was only 2*l.*, in Liverpool Road, 1*l.* 10*s.*, in Brazennose Street 13*s.* 4*d.*, in Albion Street and Little Peter Street 10*s.* the list one remarkable example of increased values relative to the Prince's tavern, at the corner of Cross Street and John Dalton Street. The tavern has been razed and a block of business premises built in its place. It was sold by auction in 1885 for 14,300*l.*, which works out at the rate of 54*l.* a yard, and it was resold privately not many months ago at a price which, we are informed, was considerably over 100*l.* a yard.

In the last twenty-four years there has been a steady and substantial advance of values in Market Street. In 1880 there was a sale of 81 to 89 Market Street, at 63*l.* 10*s.* a yard; in 1883 a sale of 102 and 104 Market Street, at 73*l.* 10*s.* a yard; in 1894 a sale of 35 and 37 Market Street, at 95*l.* a yard, and in July of the present year a sale of 72 and 72A Market Street, at 100*l.* a yard. In Oxford Street sales in 1891 and 1900 show that the price per yard has gone up from 2*l.* to 5*l.* 7*s.* 6*d.* Cross Street values appear to have been doubled in twenty-three years. A plot of land and buildings at the corner of Cross Street and King Street with a chief rent of 4*l.* was put up for auction in 1881 and withdrawn at 20,250*l.*, which worked out at 60*l.* 10*s.* a yard. The same property was sold in March, 1900, for 40,000*l.*, which is at the rate of 120*l.* a yard. The 1881 bid was at the rate which generally obtained at that time, for we have details of a sale in the same year of shops and offices at the opposite corner of Cross Street and King Street, and there the price per yard worked out at 63*l.*, and again in 1881 there was bidding for the shops 59 and 61 Cross Street, and 1 to 5 Princess Street, a site of 420 square yards, which worked out at 59*l.* 10*s.*, ignoring the chief.

Figures concerning property sales in other central thoroughfares of the city show that those we have given are in no way exceptional advances. The value of land in Manchester has gone up at a surprisingly rapid rate in the last quarter of a century, and every sale of property shows that the advance is still going on.

JENNINGS' PATENT DUPLEX BATH VALVES

(For Hot and Cold Water Supply), and
HALF-TURN LEVER WASTES

Upwards of 5,000 in Use in Various Parts of the Country in Public Baths, Asylums, Hospitals, Infirmarys, Hotels and Private Houses.

THE

Architect and Contract Reporter.**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

IMPORTANT NOTICE

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,
Messrs. W. HAY FIELDING & CO.
becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

COMPETITIONS OPEN.

ALNWICK.—Jan. 24.—The governors of Alnwick infirmary invite designs for a new building. First premium, £100; second premium, £30. Mr. Frank Caws, F.R.I.B.A., has been appointed assessor. Plans on application to Mr. W. T. Hindmarsh, 26 Bondgate Without, Alnwick, hon. sec. to the building committee.

AYLESBURY.—Feb. 28.—For public elementary school for 750 children. Premiums 50% and 25%. Conditions and plan

of site obtainable from Mr. C. G. Watkins, Education Secretary, Aylesbury, on payment of 1*l.* 1*s.*

BELFAST.—Jan. 17.—The library and technical instruction committee seek sketch designs in competition for three Carnegie branch libraries. They are to be addressed to the Chairman, Public Library, Royal Avenue, up to 12 noon on January 17. Printed conditions, with plan of the sites, will be supplied by the Chief Librarian.

LAMBETH.—March 30.—For municipal buildings at Brixton Hill. Particulars from Mr. H. J. Smith, Town Hall, Kennington, S.E.

OXFORD.—Feb. 1.—The education committee of the county of Oxford invite competitive designs for a provided school for 800 children in three departments, together with a teacher's house, at Caversham. Mr. S. Stallard, county surveyor, Oxford.

PRESTON.—Feb. 28.—Designs and plans for new elementary school. Premiums of £50, £30 and £20. Plan and conditions from Director of Education, Education Offices, Preston.

WOLVERTON.—Feb. 28.—For public elementary school for 400 girls and 400 infants. Premiums 50% and 25%. Also for secondary school to accommodate about 120 boys and girls. No premiums offered. Conditions to be obtained on payment of 1*l.* 1*s.* in each case from Mr. C. G. Watkins, Education Office, Aylesbury.

CONTRACTS OPEN.

ARNSIDE.—Jan. 24.—For the erection of the north aisle, &c., to St. James's Church, Arnside, near Kendal. Mr. R. Morton Rigg, architect, Arnside.

BILLERICAY.—Jan. 19.—For the conversion of the Billericay town hall, Essex, into a police station. Mr. F. Whitmore, county architect, Duke Street, Chelmsford.

BILLERICAY.—Jan. 23.—For the erection of cottage homes for children at Billericay, Essex. Mr. T. Hillier Pyke, architect, 61 Prestbury Road, East Ham.

BRADFORD.—Jan. 16.—For works required in erection of two hospitals at the union workhouse, Horton Lane, Bradford, for the Guardians. Mr. Fred Holland, engineer and architect to the Board, 11 Parkinson's Chambers, Hustlergate, Bradford.

BRADFORD.—Jan. 17.—For the internal joiner and cabinet-maker's work required in the enlargement of the central offices in Manor Row, Bradford, for the Guardians. Messrs. Empsall & Clarkson, architects, 7 Exchange, Bradford.

CARDIFF.—Jan. 16.—For erection of a Sunday school at St. Catherine's, Canton, Cardiff. Mr. George E. Halliday, architect, Cardiff.

TRADE NOTES.

THERE seem to be no limits to advertising. The Ripolin Company, of 110 Fenchurch Street, London, the proprietors of Ripolin paint, are issuing a small case of sticking-plaster as an advertisement of Ripolin. We trust that their enterprise may be rewarded, and that the recipients will "stick" to Ripolin.

THE calendar produced by Messrs. Diespeker, Ltd., differs from others by having a view of St. Peter's, Rome, and Bernini's Courtyard in front. They also give examples of some of the mosaic pavements in Classic style, which are probably the most successful of their class recently produced in England.

MESSRS. McDOWALL, STEVEN & CO., LTD., of London, Glasgow and Falkirk, have we understand just secured the contract for the cooking apparatus required at the New Renfrewshire combination poorhouse, which is being erected at Crookston, near Paisley, N.B. The plant consists of coal-fire range, steam serving table, central cluster of four eighty-gallon steam boiling pans, two batteries of vegetable steamers, tea-infusing apparatus, &c. The firm is very busy in this class of work, having also in hand at present, among other contracts, the cooking appliances for other two work-houses and a sanatorium at Blackpool.

THE International Archæological Congress will be opened at Athens by the Crown Prince of Greece on April 7. The congress will last a week, and the Crown Prince is expected to preside at some of the sittings. The opening meeting will be held in the Parthenon, and M. Carapanos, the Minister of Public Instruction, will address the members of the congress. The Director of Greek Antiquities and the directors of foreign schools will give an account of the progress of archæological research in Greece. The congress will be divided into seven sections, I., classical archæology; II., prehistoric and oriental archæology; III., excavations, museums and preservation of monuments; IV., epigraphy and numismatics; V., Byzantine archæology; VI., instruction in archæology; VII., geography and topography. The official language of the congress will be French. At the conclusion of the congress a tour will be organised among the islands of the Ægean, &c.

FULL LIST, and dates when they appeared, of THE CATHEDRALS which have been published on Application to The Publisher.

ELECTRIC NOTES.

THE Eccles Town Council are to make application to the Local Government Board for power to borrow 500*l.* for the purchase of electrical motors to let out on hire.

THE Local Government Board have sanctioned the borrowing by the Barrow Town Council of 35,000*l.* for electric-lighting purposes.

THE Bradford City Council on Tuesday sanctioned a scheme estimated to cost over 40,000*l.* for the distribution of electricity.

THE Chesterfield Town Council have appointed Mr. R. L. Acland the electrical engineer to the joint offices and manager of the Tramways Department, at a salary of 350*l.* per annum, rising to 400*l.* at the expiration of a year if satisfactory.

MR. R. B. LEACH, of Birmingham, has been appointed electrical engineer to the Farnworth District Council in place of Mr. J. D. Pember, who now holds a similar position at Dartford, Kent. There were a hundred applications for the post.

THE Metropolitan District Railway has deposited a short Bill for next session the effect of which will be to empower it to raise 400,000*l.* for general purposes, for adapting the railway for electrical working, to provide for any loss on the sale of rolling-stock or plant, and to provide payment of arrears on the company's guaranteed stocks.

THE Worcester Town Council elected recently Mr. C. M. Shaw, Wakefield, to the position of electricity engineer at a salary of 400*l.*, rising by annual increments of 20*l.* to 500*l.* The two selected candidates before the Council were Messrs. W. J. Bache, Gloucester, and E. E. Hoadley, Maidstone.

THE Tramways and Light Railways Association will meet on the 13th inst. at the rooms of the Society of Arts, when a lecture on "Overhead Equipment" will be delivered by Mr. Henry M. Sayers, M.I.E.E. The chair will be occupied by Mr. A. L. C. Fell, chief officer of the London County Council tramways.

THE Holborn Borough Council have received a letter from the Railway Department of the Board of Trade stating that, after full consideration, the Board have approved of

the use on the northern tramways of a slot, not exceeding 1 inch in width, in connection with the underground conduit system of electrical traction proposed to be adopted.

THE Birkenhead electricity committee having in view the advantages of the penny-in-the-slot meters for the supply of gas, are now adopting the system for the supply of electricity. The meters are installed without any charge, and the cost of the current is 5½*d.* per unit, an equivalent to one penny for five hours' illumination.

THE Bahia Blanca and North-Western Railway Company have passed a resolution approving certain alterations in the articles of association, enabling the company to use and supply electricity for lighting and motive power, it being intended to light the company's various works by electricity, and, if hereafter thought advisable, to electrify the tramway.

THE Secretary of State for India has sanctioned the appointment of an adviser on electrical matters to the Government of India at a salary commencing at 70*l.* per month, rising to 110*l.* Private practice will be allowed, but not for municipalities or district boards, as it will be part of his regular duties to advise such bodies. It appears to be probable that ere long a school of mines will be established in India.

THE extensive defensive works being constructed by the Austrian Government in the coast region of the Trentina is a huge electric reflector. Part of the equipment is being erected in the fort on Mount Brione. This reflector is of such power that it will search the whole of Lake Garda by night or day, and will, besides, command the coast-line so completely that no torpedo-boat could possibly escape it.

It is computed (says the *Standard*) that if the whole of the twenty-nine borough councils of the Metropolis adopted the combination of dust destructors and electrical works in the different areas under their jurisdiction, which is utilised at the present time by only six of them, a saving of 300,000*l.* per annum to the ratepayers could be effected. Some forty boroughs in the provinces have adopted the system which is now so earnestly advocated in various quarters, and at least twenty others have the matter under consideration. Several metropolitan borough councils, too, are discussing the advisability of following the examples set by Shoreditch, the pioneers of this method in London.

CROSLAND HILL STONE, HUDDERSFIELD.

Best Crosland Hill Stone, suitable for all classes of good work, specified by most leading Architects for Church Work and Public Buildings.

Can be supplied in Random Blocks for sawing into Slabs, Panels, Heads, Sills, Mullions, Cornices, or Blocks for Carving, &c.

CHARLES D. PHILLIPS, NEWPORT, MON.

THE Marylebone Borough Council have accepted the conditions proposed by the London County Council for the raising of a loan of 100,000*l.* (on account of the 340,405*l.*) upon the terms that the loan is taken up as to 50,000*l.* at once and as to 50,000*l.* at a time convenient to the County Council and repaid with interest at the rate of 3*l.* 15*s.* per cent. per annum, calculated quarterly, by seventy-nine equal half-yearly instalments of principal and interest combined within a period of forty-two years from the date of the advance.

A DEPUTATION of the Bradford electricity committee recently visited Dublin for the purpose of inspecting and inquiring into the working of the new three-phase alternating current system, with a view to its adoption by the Bradford Corporation, who are about to expend some 50,000*l.* or 60,000*l.* in extending and improving their existing system, which is continuous current. The members stated they had, before coming to Dublin, visited the works at Newcastle-on-Tyne and Erith, near London, but what they experienced in Dublin had confirmed their decision to adopt the three-phase system for lighting and power instead of making a further extension of the continuous system.

THE Manchester City Council have arranged terms in the matter of the action of *Hartars v. The Corporation of Manchester*, which was brought to recover compensation for vibration caused in the plaintiff's works by the processes carried on at the Bloom Street electricity station. The writ was issued two years ago. It was hoped by the electricity committee that the purchase of any property might be avoided, and an eminent authority on vibration was consulted. His scheme, which was tried at a cost of several thousands of pounds, proved a failure. The electricity committee have received sanction to purchase two warehouses adjoining the Bloom Street station.

THE General Electric Company of Berlin (*Allgemeine Elektrizitäts Gesellschaft*) have entered into a working alliance with the Thomson-Houston for business in Spain and Portugal. In these markets the allied firms will trade under the style of the "*Allgemeine Elektrizitäts Gesellschaft Thomson-Houston*," or Thomson-Houston General Electric Company, which has been formed with a capital of 3,000,000 pesetas. Under this arrangement the actual

industrial and commercial work to be obtained in Spain and Portugal will be carried out by the General Electric Company, and the Thomson-Houston Company's interest will be exclusively financial.

THE Crewe Town Council had, at last week's meeting, further tramway proposals under consideration. Various schemes, both private and municipal, have been proposed, and one company obtained an order to construct a tramway in the borough, but on account of certain restrictions the order was allowed to lapse. The last municipal scheme was defeated by a poll of the ratepayers. The Corporation has since been inquiring as to the practicability of motor buses. A report from the Hastings Omnibus Company showed that the working cost of a motor bus was 11*½d.* per mile, the earning capacity 1*s.* 2*d.* per mile, and that two buses ran 55,000 miles in twelve months. It was finally resolved to inform Dr. Rhodes, of Manchester, who asked the Council to support a private electric tramway company, and Mr. S. Jackson, who offered to promote a service of steam motor omnibuses, that the Council could not support their schemes for the borough.

THE Hampstead Borough Council have decided to purchase the undertaking of the North-West London Electric Supply Company. This concern, which was formerly known as the Hampstead Battery Company, has offices and a generating station near the Midland Railway in Finchley Road, almost exactly in the centre of the borough, and has been a rival of the Council for the supply of electricity in one of the wealthiest parts. Several years ago the late vestry secured an order enabling them to establish a municipal electric supply, and the undertaking has been developed to such an extent that the Council now has 5,000 customers. The capital expenditure amounts to 346,608*l.*, and last year the income was 58,051*l.*, and the surplus profit 5,796*l.* In spite of the fact that the private company were not allowed to lay mains in the public roads, they succeeded in obtaining concessions to pass through private property, chiefly railway land, and so they secured over 700 customers in the heart of the district. Their inability to extend their supply was a serious obstacle to them as a company, and, after protracted negotiations, they have agreed to sell the whole concern to the Council for 12,000*l.*

BUILDING AND BUILDERS.

THE Aston Board of Guardians adopted on the 10th inst. detailed plans of a new pavilion to be erected for the accommodation of 112 male pauper imbeciles and epileptics.

MR. WHITWORTH WHITTAKER, of Rochdale Road, Oldham, builder and contractor, who died on October 4, left personal property of the value of 77,179*l.*; the whole of the estate being valued at 90,079*l.*

THE Essex County Council have decided, on account of the crowded state of the lunatic asylum at Brentwood, to erect an additional asylum at Colchester at a cost of half a million sterling.

THE Smethwick education committee have given instructions that plans should be prepared for the erection of buildings to accommodate a technical and a secondary school upon a site provided by the Town Council, at a cost of 10,000*l.*

THE Portsmouth Corporation are to institute proceedings for the first time under their new building by-laws, which were only put into force after consideration extending over a period of several years. It is alleged they have been infringed by a local builder by using a quantity of mould instead of sand in the making of mortar used in the construction of houses at Southsea.

UNDER the provisions of the Accrington District Gas and Water Board Bill it is intended, at a cost of several thousand pounds, to authorise the Board to make new waterworks and to extend the limits of supply for gas and water. The new works are to include the construction of a reservoir, to be known as the Deanclough reservoir, and other works in the parish of Great Harwood, and the extended boundary would be to the outer limits of the parish of Altham.

THE Foreign Office have issued a consular report on the German cement industry. The report states that no other branch of industry in Germany has probably ever experienced such a rapid expansion, and also during recent years such an extraordinary over-production, as the cement trade. The beginning of the industry dates back only to the year 1852. Yet the annual output at the present time is estimated at 30,000,000 casks. Of this quantity some 700,000 tons, valued at nearly a million sterling, were ex-

ported during the year 1903. The over-production has had a ruinous effect on prices in Germany.

THE Metropolitan Asylums Board have been informed by the works committee that the actual cost of completion of the Park Hospital was 251,711*l.*, of which 227,457*l.* (less a certain sum paid out of the surplus on fees of medical students and an amount received for old buildings and materials) was for erecting and fitting-up the hospital, constructing a well and providing a water-softening apparatus making up and paving roads abutting on the site, and a few minor works, 10,920*l.* for furnishing the hospital, and 15,293*l.* for architects' commission, quantity surveyor's charges, clerks of the works, wages and lithography and printing. Exclusive of the cost of the land and of the furniture the cost per bed was nearly 440*l.*

THE Bolton Town Council recently received a letter from a Liverpool firm of contractors respecting their tender for the Hacken sewage works contract. They complained that the tender of another contractor had been reduced after the amount of theirs had been ascertained, and that the former was accepted, although still somewhat higher than theirs. The subject was discussed at length by the Council, and it transpired that the reason was that the committee which had the matter in hand desired to afford an opportunity of employment to local men by giving the contract to a local firm. In the end it was resolved that the matter could not be reopened.

THE Accrington Town Council discussed on Monday the placing of the contracts for the erection of a school to accommodate about 100 children. The education committee had recommended the acceptance of the tender of Messrs. W. Eaves & Co., a Blackpool firm. Afterwards it was decided to consider whether the greater part of the work could not be given to local contractors, whose tenders had been previously rejected. In the discussion it was urged by some that it would be unfair and dishonourable not to give the contract to Messrs. Eaves, and by others it would be quite legitimate to do so, seeing that both the education committee at a later meeting and the general purposes committee had recommended it. By seventeen votes to eleven the Council decided to give the contracts to five persons, four of whom were local, their combined tenders amounting to 11,273*l.* (23*l.* more than that of Messrs. Eaves).

THE Arbroath Town Council had under consideration on Monday a letter from H.M. Office of Works referring to the intimation that the Council were disposed to enter into an arrangement for handing over the buildings outside the Abbey gate, at present in possession of the Council, to the charge and management of H.M. Office of Works. A plan received from Mr. Oldrieve, the surveyor, indicating what are the buildings referred to, was laid before the Council. Mr. Oldrieve asked if the plan showed correctly what is intended, in order that a report on the subject might be made to the Board of Works. The plan was approved of, and it shows that the buildings in question, which include the Regality Tower, should be transferred to the Board of Works, who shall in future undertake the preservation of the buildings. It was agreed that the Abbot's House, excluding what is known as the kitchen, should be retained in the hands of the town and the rent drawn as hitherto.

THE report of Mr. Thackeray Turner, architect, upon the condition of the ancient parish church at Carisbrooke, which we summarised last week, has been submitted to a meeting of the church restoration committee, who have decided to form a sub-committee of practical men, experienced in building work, to look into the matters mentioned in the report, and also to report on other important points which Mr. Turner had not dealt with. The committee spent two days going over the whole building, examining the tower, church roof and walls, &c., making a thorough investigation, and have found that in some points their report does not bear out Mr. Turner's views. The

bells were found to be properly hung, some of the tower stairs need renewing, and the pinnacles require attention; the tie-beams and roof are sound, but the roof will have to be stripped and relathed. Mr. Turner's objections to the chancel are, the report states, based on mistaken observation, due to bad weather and shortness of the day. The old foundations are in existence, and no graves need be disturbed if the chancel is rebuilt on the ancient lines. To build the chancel will not necessitate the reseating of the church.

VARIETIES.

MR. H. H. STOTT, borough surveyor to the Hove Town Council, has prepared a scheme for dealing with the sewage of Aldrington so as to drain it into the intercepting sewer. Application for a loan of 26,200*l.* is recommended.

MR. JAMES BARTON, C.E., has expressed his willingness to give his services to the Bann drainage conference committee in the preparation of an alternative scheme to that suggested by the Board of Works engineer.

THE Tamworth Rural District Council have instructed the plan committee to consider the advisability of adopting new by-laws for the whole of the rural district of Tamworth.

THE St. Helen's Town Council rejected a resolution that instead of three members attending the Health Congress in London, as arranged, only two should attend, and that a professional stenographer should be engaged to supply a verbatim report of the proceedings.

THE Great Central Railway Company are about to lay pick-up water tanks at various points on their system for the use of all descriptions of trains. It has been found that the usual process of filling boilers from the standards wastes time and impedes traffic.

THE death is announced, at Melbourne, of Mr. Ernest Lyon Fletcher, eldest son of the late Mr. Thomas Fletcher, of the firm of Fletcher, Russell & Co., Ltd., gas engineers and artistic ironfounders, Warrington, London, &c. He was formerly a director of the firm, and was also at one time a captain in the Volunteers. He was about 33 years of age.

Queen Anne's Chambers,
Park Works, MANCHESTER. WESTMINSTER, LONDON, S.W.

THE Edinburgh Merchants' Association, who are the principal movers in the exhibition proposed to be held in Edinburgh in 1907, have circulated petitions for signature praying the Town Council to take the proposal into consideration and call a public meeting of the citizens.

ONLY 200 yards more remained on the 7th inst. to be bored before the perforation of the Simplon tunnel is accomplished, and it is hoped that if no fresh springs of water are discovered the two apertures will be united about the middle of next month.

THE Local Government Board have distributed circulars containing the order which it has issued under sub-section 2 of section 8 of the Housing of the Working Classes Act, 1903, prescribing forms in substitution for those in the fourth schedule to the Housing of the Working Classes Act, 1890.

PROFESSOR BOSTOCK HILL will give a course of lectures on "Sanitary Engineering Law and Statistics" at Birmingham University to meet the requirements of public health students. The lectures will commence on Monday, and will be illustrated by models, diagrams, &c. Fee for the course, 2*l.* 2*s.*

THE Macclesfield Town Council has appointed Mr. William Newbiggin, of Manchester, to be the gas engineer, at a salary of 300*l.*, with permission to continue his practice as a consulting engineer so long as it does not interfere with the management of the works. Three members of the same family have held the position in succession.

THE paving committee of the Manchester Corporation have found work this week for 834 of the unemployed, or twenty more than last week. All the men are engaged through the Labour Bureau. The conditions of employment are that men who work not less than three full days in succession are paid at the rate of 5*s.* 6*d.* an hour, and those who work for shorter periods receive 5*d.* an hour.

THE Parish Council of Shavington, a suburb of Crewe, recently erected some lamps. The ratepayers held a meeting, passed a resolution protesting against the lamps, of light being paid for out of the rates, censuring the Council and requesting them to resign. For some nights following the lamps were unlighted. They have since been relighted and there is a recurrence of excitement.

THE Aston Town Council recently applied for a loan of 12,500*l.* to pave Lichfield Road. At the inquiry it was stated that an agreement had been entered into with the County Council to pay 1,000*l.* per annum towards the upkeep of the road. The Corporation recently took over the tramway system, which has been running on this road for the past twenty years, and entered upon a scheme of reconstruction and electrical equipment of the new tramways. That work having been completed, it was thought desirable by the county and borough surveyors to pave the road from Tower Road to Grayelly Hill with granite setts, the total being 13,625 square yards.

FURTHER details were published on Saturday respecting the proposed docks at Harwich, concerning which a Bill has been deposited for promulgation next session. The promoters are asking for powers to raise 2,000,000*l.* in shares, and in addition to issue up to 500,000*l.* debenture stock. The total area proposed to be covered is about 250 acres, which would allow ample room for warehouses, offices, granaries and general quay accommodation. The docks proper would extend over 100 acres and would be approached by a main entrance lock 800 feet deep and 80 feet wide, with a minimum low-water depth of 20 feet, rising to 33 feet.

An inquest was held into the death of an aged couple who were poisoned in their bedroom at Holloway. A three-light telescope chandelier had been drawn down some distance, and there being no water in the tube, there was a large escape of gas. It was explained that with coal-gas it required very much less to poison than to suffocate. While one part of gas to ten of air was needed to cause an explosion, one in thirty would cause death. The Coroner remarked upon the danger of old-fashioned telescopic gas chandeliers, and said that an invention had been introduced which rendered the use of water in chandeliers unnecessary, and it was to be hoped the invention would be more generally adopted.

At the last meeting of Lewes Board of Guardians, a member complained that in connection with the Christmas decorations at the workhouse a cottage intended to be a burlesque of Sir William Grantham's cottage was erected. If his information was correct he thought the Board should dissociate themselves from anything of that kind. The clerk, who is also clerk of the Chailey Rural Council, said

he did not think the matter could be taken seriously. The plans of this cottage, though not approved, were, he believed, drawn about twelve months ago—long before the dispute arose with Sir William Grantham. It formed a background to a figure of Father Christmas, and was certainly not intended to be a "take off" of Sir William's cottage. The Board took no action.

The Stockport Corporation having purchased the Hazel Grove tramways, a meeting of the shareholders of the company was held on Monday night. The purchase price was 24,000*l.*, and it is proposed to pay the shareholders 27*s.* per share and 10 per cent. from the date of the last dividend. The secretary of the company, who was appointed liquidator, is to receive 200 guineas as compensation. The directors were awarded 150*l.*, the manager 200*l.*, and the solicitor to the company 100 guineas. A sum of 735*l.* was allotted for winding-up purposes, and it was decided to give the employees one week's extra salary. The Corporation tramways committee has accepted a tender, amounting to nearly 7,000*l.*, by Messrs. Scott & Co., of the Leeds Steel Works, for rails for the Hazel Grove route.

COAST EROSION.

At last week's meeting of the Isle of Wight Rural District Council a further letter was read from Mr. G. W. Colenutt, F.G.S., as to the damage being done by the removal of shingle from the beach at Whitecliff Bay for use in the construction of Government fortifications on the downs above, stating that, as a further opinion might have the effect of inducing the lord of the manor (Sir Graham Hamond-Græme) to reconsider the whole question, he had written to Sir Archibald Geikie asking whether he agreed that it was a short-sighted policy for the lord of the manor to allow the natural accumulation of shingle on the beach to be carted away. Sir Archibald Geikie wrote in reply:—"I entirely agree with you in your view as to the short-sightedness of the authorities who remove the shingle from the beach and thus take away the only natural protection to the base of the cliff. I hope your opposition and that of the Rural District Council may succeed in arresting the abstraction of the shingle." Mr. Colenutt added that it would

hardly be possible to find anywhere in Europe an authority whose opinion on questions of denudation and erosion carried more weight than that of Sir Archibald Geikie. As a student of the geological features of Whitecliff Bay for thirty years, Mr. Colenutt says:—"I emphatically repeat that the removal of shingle from the beach will inevitably result, at no distant date, in a marked and disastrous increase in the sea erosion of the cliffs along the whole sweep of the bay. As a matter of fact the sea, following the removal of shingle, is now washing away portions of the bases of the cliffs which, from my own knowledge, have not been touched by the sea since 1881." It was decided to send a copy of the letter to the lord of the manor with the object of preventing further removal of the shingle.

BUILDING IN BLACKPOOL.

A LOCAL GOVERNMENT BOARD inquiry was held at the Blackpool town hall last week for the purpose of obtaining sanction to borrow a further sum of 5,400*l.* in respect of the Corporation stables in Rigby Road.

The Town Clerk said the original application was heard in May 1902, when the Corporation applied for sanction to borrow 12,000*l.* to erect the stables. The actual cost had been 17,531*l.* 12*s.* 10*d.*, but as sanction was only given for 11,880*l.*, which left a balance in excess of 5,651*l.* 12*s.* 10*d.*, the application that day was for 5,400*l.*, and the balance of the amount in excess, 251*l.* 12*s.* 10*d.*, would be met in another way by the Corporation. The excess had been occasioned by the treacherous state of the land, which was far more boggy than they had expected. Tests were made by the use of weights, and the results justified the Corporation in building stables of one storey high. In the immediate district there were the refuse destructor works, with a large and heavy chimney and other buildings on land similar to that on which the stables were erected. Whilst the excavations were being made for the chimney, however, they found that the land was boggy, and the Corporation wisely decided to excavate down to firm clay, and in doing that they had a pump to draw off the ream water from the adjoining land. That caused a subsidence on the site of the stables, and in consequence a

small portion had to be re-erected. In carrying out those works the Corporation, instead of paving the large yard of 8,500 square yards with old setts, decided to use new setts. There had been no material departure from the plans. The excess was almost entirely due to the treacherous nature of the soil and the drawing away of the ream water underneath.

Mr. J. S. Brodie, the borough surveyor, said three separate tenders were accepted for the buildings amounting in the aggregate to 7,038*l.*, against his estimate of 7,644*l.* At a depth of 23 feet yellow clay was found. Owing to the nature of the soil he had anticipated some little treachery. Special provision was made by making extra wide foundations, after which they tested by means of weights of about four times the actual weight of the buildings. The tests were made up to nearly 2 tons per square foot, and were quite satisfactory. At the same time the chimney of the destructor works was being erected about 36 yards from the stables, the chimney being 210 feet high and 8 feet diameter at the top, and in consequence the pressure on the foundations was very great. Knowing that, they carried the foundations down to the yellow sand, and in getting through the soil they came across a quantity of ream water, and in pumping that off the stables close by began to show signs of subsidence, which was visible almost as soon as the foundations were commenced. The building at the end of the smithy they had to store shoeing iron, and in order to get the proper height the walls were carried about 6 feet higher. The effect of that extra height was most marvellous. There was a clear subsidence of the foundations, and finally they had to take part of the building down and put in new foundations and rebuild. He attributed the excess in expenditure to the treacherous nature of the ground upon which they had to build, and that, in his opinion, was aggravated very much by the fact that they had to go on almost simultaneously with the destructor works close by. He thought it went without much proving that the site being adjacent to the destructor works, where about 80 per cent. of the carting is done, was most convenient, and the best site to erect upon from an administrative point of view, the horses practically finishing there at night. The full stable accommodation now was for seventy-five horses.

Mr. Preston and Mr. Eaves, contractors, gave evidence as to the nature of the soil.

There was no opposition.

BUILDING ACT AMENDMENT.

At a meeting of the United Wards' Club of the City of London on Tuesday, Mr. E. V. Huxtable read a paper "The New London Building Act Amendment Bill." He criticised generally the action of the County Council in framing the Bill, and dealt specifically with the effect of certain sections should it become law. He urged that these sections offended against the underlying principles of equity which had actuated the Legislature in passing enactments of this character for the last fifty years. Any Bill which departed from these principles, which was retrospective in character, and which did not provide for adequate compensation, would never become law. He did not suggest that the London Building Act of 1894 did not require a certain amount of amendment in order to provide for the ever-growing needs of the Metropolis for the parts of the measure referring to escape in case the fire might well be amended. One of the principal objects of the Bill with which he was dealing was an attempt to improve London at the expense of the owners and occupiers. As a present drawn it was as drastic and unsatisfactory as its predecessor. There was still a lack of differentiation between classes of property, and there was a repetition of the burdensome requirements in regard to existing buildings. The result of its application in some respects would seriously depreciate the value of commercial buildings. The City would be peculiarly affected by it, and in addition to the expense of the alterations demanded, there would necessarily be a considerable sacrifice of building space. Many of the defects of the Act of 1894 were in effect provided for by the Bill which the Corporation was about to introduce. In the course of a discussion the provisions of the London County Council's Bill were strongly criticised and notice was given of a resolution to be moved at the next ordinary meeting condemning the measure, and requesting the Corporation to call a meeting of the citizens at the Guildhall to protest against it.

THE USHER HALL, EDINBURGH.

A MEETING of the special committee of the Edinburgh Town Council was held on December 30, when the report on the estimates for the erection of the Usher hall, which had been before the committee at two previous meetings, was finally adjusted, ordered to be printed and circulated amongst the members of the Council. The report is as follows:—

Edinburgh, December 30, 1904.—At a meeting of the special committee of the Town Council on the new City Hall. Present:—The Lord Provost, Convener; Bailie Dobie, Dean of Guild Bruce, Treasurer Brown; Judges Sir Andrew M'Donald and Telfer; and Councillors Forrest, Alfred A. Murray and M'Arthy.

The committee, having at previous meetings opened and considered the estimates received from contractors, along with reports from the architects thereon, and having obtained information on many points from the architects and measurers, beg to submit the following report:—

Of this date, February 16, 1904, the magistrates and Council at a special meeting approved of a report by the Lord Provost's committee recommending approval generally of design No. II. at a probable cost of 145,000*l.*, which includes the proposed widening of the roadway in front and the erection of a retaining wall, and remitted to obtain estimates for the work. During the discussion in the Council it was suggested, with the general assent of the members, that the floor and steps shown on the design submitted should be lowered.

Of this date, March 22, 1904, the magistrates and Council passed a resolution in the following terms:—"That the magistrates and Town Council resolve that the total cost to be incurred for the site, erection and completion of the new City Hall—including the proposed widening of the roadway in front and the erection of the retaining wall—shall not exceed the maximum sum of 145,000*l.*, and that the city architect be instructed to this effect."

Specifications and schedules were duly prepared, and, after due advertisement, estimates were received from a large number of contractors for the work of removal and erection in terms of the plan which is approved generally as aforesaid. Seeing that in the present case there has to be considered

the question of the maximum sum, the committee, instead of following the usual course at this stage and recommending the acceptance of the lowest estimates under the various heads, submit the particulars of these estimates, with explanations which will enable the magistrates and Council to remit to the committee with instructions regarding the tenders to be accepted.

Taking the tenders as they have been received upon the plan approved of as aforesaid, and after modification by the architects upon some of the items in the schedules, the result will be as follows:—

Mason work	£44,439
Smith work	3,372
Carpenter work	2,937
Joiner and ironmongery work	5,600
Plumber work	2,182
Slater work	709
Plaster work	6,378
Glass work	777
Marble work	3,807
Heating arrangements	4,438
	<hr/> £74,639

And the following items fall to be added:—

Electric-light installation, estimated at	3,930
Painter work (first)	1,200
Seating	1,250
Measuring, clerk of works, &c.	2,500
Organ and additional furnishings	4,000
Fire appliances	500
	<hr/> 63,380

To which add minimum tender for retaining wall at street widening 7,971

Total, exclusive of cost of site £95,990

The architects, in giving effect to the suggestion of the Council as aforesaid, have prepared an amended elevation showing six pillars in front. This amended elevation is submitted herewith. Members will judge how far it is an improvement on the original elevation, and it has the following advantages:—(1) Under it the steps will not project so far into the roadway, and the necessity of widening the

ADVANTAGES.

Absolute and perfect flush guaranteed with 1½ gallons of water.

ABSOLUTELY NOISELESS.

Not depending on syphonic action.

No double trap required.

The whole surface of pan perfectly cleansed each time of flushing.

Telegraphic Address, "OUTRAM, WOODVILLE."

C. W. OUTRAM & CO. WOODVILLE, near Burton-on-Trent. Excelsior and Rawdon Potteries,

roadway to the extent required by the original plan and the expensive retaining wall will be avoided, a light wall and railing with a modified widening being sufficient; and (2) the front as thus amended will cost 4,000*l.* less than the original design. If this modification is adopted the figures will work out as follows:—

The total contract price, as before, was £95,990
Deduct—

- | | |
|---|--------|
| (1) The cost of the retaining wall. | £7,971 |
| Less the estimated cost of the widening and substituted wall and railing | 1,200 |
| | £6,771 |
| (2) The sum saved on the original estimate by the adoption of the amended front | 4,000 |
| | 10,771 |

And *Add—*

Miscellaneous items 1,000

Total of the lowest alternative with the amended plan, exclusive of cost of site £86,219

The above figures cover the removal of the present building and the erection of the new building, with hewn stone front and returns, stone-faced walls at sides, part of back and sides cemented and rough-cast in panels; carving in stone work to the value of 2,000*l.*; steel-framed roof; fireproof floors, marble internal staircases, and tiled and terrazzo flooring; new hanging roadway and hewn stone screen on the south side; deal floors throughout and deal staging on galleries, and yellow pine for all finishings; lead-covered dome; Scottish slating on roofs; and about 4 per cent. for contingencies and models.

The estimated cost of the site, according to report by the Lord Provost's committee in February 1904, was 55,000*l.*, which included surplus property estimated as worth 5,000*l.*

The total amount brought out, as above, is thus less than the maximum fixed as aforesaid.

There are, however, a number of items upon which some additional expenditure might with advantage be made; and, to enable the Council to judge of these and select from them, the following alternatives are submitted, viz.:—

Improved Alternative No. I.

Taking the total tenders on amended plan (exclusive of site) as before	£86,219
<i>Add—</i>	
For British steel and cement	£263
For mahogany and oak finishings in vestibules, hall and corridors (instead of yellow pine)	3,090
Copper in place of lead on the dome	235
Additional for carving	3,000
Additional for contingencies	2,000
	8,588
Total improved alternative No. I. (exclusive of site)	£94,807

Improved Alternative No. II.

Taking total tenders on amended plan (exclusive of site) as before	£86,219
<i>Add—</i>	
For granite base instead of stone at front	£1,689
For British steel and cement	263
For mahogany or oak finishings	2,815
For copper in place of lead dome	235
Marble columns and pilasters in staircases and foyer	5,246
Marble pilasters in hall	1,477
Additional for carving	3,000
Additional for contingencies	2,000
	16,725

Total of improved alternative No. II. (exclusive of site) £102,944

The committee submit this report to the magistrates and Council, and crave a remit with instructions.

WILLIAM GREEN & CO. (Ecclesfield), Ltd., ECCLESFIELD, near SHEFFIELD

When the subject was discussed the following amendment to the Lord Provost's motion that tenders should be accepted was adopted:—"The magistrates and Council, having now received and considered the estimates for the new city hall, before accepting same resolve to instruct the committee to forthwith submit a further report showing, in accordance with schedules of quantities—(1) The cost of the dome, the square tower, and their relative bearing walls; (2) stating whether the plans can be amended so that the large hall shall receive sufficient daylight so as not to necessitate the use of electric light during morning or afternoon concerts; (3) stating whether the gallery accommodation can be substantially increased and saying if the upper gallery can be lowered or otherwise improved; and (4) giving information on the acoustic properties of the proposed new large hall, with power, if necessary, to take high qualified expert opinion on this subject.

NEW MUNICIPAL OFFICES, LIVERPOOL.

THERE is talk of big developments in Liverpool civic life. It is rumoured, says the *Liverpool Courier*, that a scheme is on the tapis for the erection of new municipal offices and public buildings. Since the extension of the city boundaries there has been great pressure on the accommodation available in the existing buildings—the colloquial "Bedpost Palace"—in Crosshall Street and Sir Thomas Street, and alterations and additions have been made which do not provide satisfactory quarters for the various departments of the Corporation. Should a unification of rating come about such as exists at Birkenhead—and the scheme there works very satisfactorily—the present buildings would be entirely inadequate. The utilisation of the George's Dock site has been much debated for a long period. It is now hinted that the public offices might be erected there. A range of buildings in keeping with the new premises for the Dock Board might form a good show spot at one of the city's chief entrance gates.

THE Royal Sanitary Institute have arranged for a conference on "School Hygiene" to be held at the University of London from February 7 to February 10.

HOUSING OF THE WORKING CLASSES.

At a meeting of the Incorporated Society of Medical Officers, Sir Lauder Brunton, M.D., opened a discussion on the report of the physical deterioration committee. Referring to house accommodation, he said:—"The last, but not the least, question which I shall touch upon is that of house accommodation. Overcrowding, with its attendant evils of uncleanness, foul air and bad sanitation, stands out prominently in the opinion of the committee as prejudicial to the health of the people. Overcrowding is almost certain to arise if people will flock in from the country to the towns, and that they do so in great numbers there is no doubt. For to every one who lived in a town in 1851 three do so now. This may perhaps be diminished by making country life more attractive, country homes more comfortable, the food in them more appetising, the cottages more attractive, and by providing some sort of amusement in country villages or country districts for men and women after the day's work is done. Much, no doubt, should be done in regard to country cottages, and building by-laws require to be carefully supervised lest they do harm instead of good. In towns the effect of overcrowding in raising the death-rate came out very prominently in the evidence before the committee, and they think that in order to lessen the evils the local authority should, with a view of setting a term to these evils, exercise their power to treat any house, or any part of a house, so overcrowded as to be dangerous or injurious to the health of the inmates as a nuisance, and for the abatement of the same notify that at a given date no one-room, or two-room, or three-room tenements will be permitted to contain more than two, four, or six persons respectively. The slums must go, and in their removal, as one witness very truly said, everything must depend on the powers of the medical officer of health, on the keenness with which he exercises these powers and on the way in which he is supported. As things are at present the medical officer of health, by the very thoroughness with which he discharges his duty, may incur the dislike or resentment of some of the local authorities by whom he has been appointed, and they will in consequence try to get him discharged, if they can, sometimes unfortunately with success (Par. 13,511).

SIMPLY AND RAPIDLY ERECTED

In paragraph 118 of the report the committee make a proposal which seems to be a good one, that the medical officer of health should have security of tenure and not hold his office at the goodwill of the local authority. Behind the medical officers of health stand at present the Local Government Board, but the offices of this Board are so manifold that it is impossible for it to discharge them all properly, and perhaps the best thing for the country would be to have a Board of Health. There does not seem to be at present very much chance of such a Board being appointed, and in place of it the committee propose an Advisory Council which should represent the Department of State within whose province questions touching the physical welfare of the people fall, with the addition of members of the community by the medical corporation and others, whose duty it should be to receive and apply the information obtained from a bureau of the Local Government Board, with the whole weight of Government authority and scientific prestige behind them. It would be their function to advise the Government on all legislative and administrative points in respect of which State interference in health matters was expedient, consider and report upon all problems of public health, and guide the action of representatives in this country in foreign congresses of public health.

THAMES BARRAGE SCHEME.

At the last meeting of the Civil and Mechanical Engineers' Society, Mr. James Casey gave a description of his scheme for constructing a barrage across the Thames from Gravesend to Tilbury, a scheme which, in his opinion, offered a solution of the complicated problem of attempting to remove the difficulties and inconveniences attending the navigation of the river, owing to the increasing size of the steam vessels, and in properly controlling the enormous volume of commerce flowing into and out of the port of London. The proposed barrage would also afford a harbour capable of holding the entire British fleet afloat at all times; and, so far as facilities were on the spot, enable it to be ready for action, leaving nothing to chance or risk of delay. The barrage would be constructed of solid concrete, with granite facings, provided with four locks, two of which would be 1,000 feet in length and two of

800 feet, and 100 feet and 80 feet in width respectively provided with internal steel gates dividing them into lengths of 300 feet and 700 feet in the case of the large locks, and 300 feet and 500 feet in the case of the lesser ones. In addition to the outer gates a number of adjustable steel sluices would also be provided, fitted at the top and bottom of the barrage, and having sufficient area to regulate the flow and necessary scour of the river bottom during ebbs and tides. In the base of the barrage would be constructed a railway tunnel connecting Kent and Essex with the northern lines, which, from a commercial and strategic point of view, would be most valuable. At present a passenger, goods and luggage traffic to and from the Continent had to pass through London, there being no alternative route, but if this railway connection were made the traffic passing between the Continent and the eastern and midland counties and Scotland would pass directly through without change of carriage or touching London. As to the strategic value of the tunnel railway, it would be about 12 miles from Woolwich Arsenal on the west side and 75 miles from Chatham, our great naval dockyard, on the east side, thus affording direct and speedy means for the prompt shipment of men and material from their respective departments. The four proposed locks working twenty-four hours per day would be capable of passing 396 ships and 2,628 barges and small craft in one day, there being a level twice in the twenty-four hours, and special provision made for passing in and out by the aid of motor-capstans and kindred appliances. On completion the barrage would hold up a volume of fresh water from Gravesend to Teddington equal to 4,660,000,000 cubic feet. The cost of construction of the barrage, tunnels and auxiliary works was estimated at 4,100,360*l.*, and the time required for completion three years, so that, having regard to the magnitude of the work, the amount was not unreasonable in comparison with the purchase of docks, creating new ones, and dredging, extending over ten years in the river at a proposed combined outlay of 37,000,000*l.* The barrage would contain nearly a year's supply of fresh water even at the estimated requirements of 1941. When the river was held up by the barrage the present unsightly mudbanks would be covered. The proposed new steam boat service would give an impetus to pleasure traffic

facilities would be afforded for business and travel, and it would be possible to develop the large areas of sloblands lying idle on both sides of the river below the level of Trinity high-water mark. Between Woolwich and Gravesend the barrage would prevent flooding from the sea. Pumping arrangements were now being installed by the London County Council on both sides of the river for draining and preventing overflow. The adoption of the Thames barrage as a whole deserved, in his opinion, the most careful and serious consideration of the naval and military authorities, to whom alone they had to look for the protection of London, the very heart of the Empire, from the attack of any possible enemies. Further, it would add immensely to the prosperity of the Port of London by making it free. The Privy Council could constitute it a Royal harbour administered by the Board of Trade and in every way similar to the Royal harbour at Ramsgate.

the year, along with a comparative statement of the previous year and their respective approximate values. For the year ending, the total warrants granted number 832. These include 67 tenements, 71 villas, 212 self-contained houses, 128 public and other buildings and 583 alterations. In these tenements were 8 shops, 37 houses of one apartment, 266 of two apartments, 218 of three apartments, 156 of four apartments, 23 of five apartments and 9 of six apartments, representing a total number of 709 tenement houses of an approximate value of 977,883/. At this corresponding period of last year there were 785 warrants granted, and embraced 96 tenements, 52 villas, 97 self-contained houses, 115 public and other buildings and 580 alterations. In these tenements there were 25 shops, 48 houses of one apartment 207 of two apartments, 396 of three apartments, 189 of 4 apartments, 54 of five apartments, 2 of six apartments and 1 of seven apartments, representing a total number of 897 tenement houses—the year's work representing an approximate value of 825,584/, thus showing an increase in favour of this year to the extent of 152,299/.

BUILDING TRADE IN EDINBURGH.

Prominent builders, says the Scotsman, state that for dullness in trade the year 1904 has not had a parallel for a considerable time. It is rather curious to note that this view does not coincide with the building statistics of the Edinburgh Dean of Guild Court, the returns of which show more building warrants than last year. For the number of idle men, therefore, other causes must be looked for. In the first place, it must at once be admitted that only about 60 per cent. of the work included in this year's return is in operation, and, compared with ten years ago, the statistics bear out that a similar condition prevailed at that time. It would, therefore, seem to indicate that the working population in this trade is vastly in excess of what normal conditions would warrant. This is particularly the case as regards unskilled labour. In no other trade in the town has there been such an outcry about the number of idle men than in the building trade. It must also be borne in mind that there is no industry which employs a greater number of unskilled labourers, and these are as a rule not of the provident class. Undernoted is a classification of the various cases passed through the Dean of Guild Court during

The most outstanding building contracts in the centre of this city are the North British and Mercantile Insurance Company's offices, Princes Street; the premises of the Professional and Civil Service Supply Association, George Street; the British Linen Bank Company's premises at the corner of George and Frederick Street; and Jenner's at the corner of St David Street and Rose Street. Three of the largest buildings completed and occupied during the year were the Boroughmuir and Broughton schools for the Edinburgh School Board, and the imposing building in George IV. Bridge for the administration of county business.

Of other buildings for public purposes may be mentioned the large addition to the gas-works at Granton for the Edinburgh and Leith Gas Commissioners, and a very extensive addition to the electric-power station in Macdonald Road is in course of erection, which, from its recent construction, requires to be so extensively enlarged. The Scotsman Office and the Caledonian Railway Hotel have now been completed. The new premises in Forrest Hill for the Queen's Edinburgh Volunteer Brigade have been almost completed, and as seen from Lauriston, have a pleasing effect with their baronial turrets and crow-stepped gables.

JAMES CARTLAND & SON,

MANUFACTURERS OF EVERY DESCRIPTION OF

Cabinet, Builders', Furnishing, & Naval Brass Foundry,

BIRMINGHAM.

MACHINE-MADE BRASS SOCKET BOLTS.

4601
Brass, with Iron Shoot.
—
4602
With Iron Back Plate.

Made in three widths and all lengths.

THE "INVISIBLE" FANLIGHT OPENER (CARTLAND'S PATENT).

WITH SIDE ADJUSTMENT FOR HEAVY FANLIGHTS. BRASS, 1751 1/3 each IRON, 1752 1/3 each

Hinged at Bottom, Opening In. Brass 1751 5/6 Iron 1752 4/-

For Pivot Sashes. Brass 1755 5/6 Iron 1756 4/-

Hinged at Top, Opening Out. Brass 1753 5/6 Iron 1754 4/-

The advantages of this invention will be appreciated by Builders, Architects, and others, as being a perfect Fanlight Opener, without the disadvantage of any unsightly part projecting into the room, to the impediment of blinds, &c. It is equally suitable for sashes hung at top, bottom, or pivot sashes.

THE "GRAPPLER" PATENT SASH FASTENER (Appleton's Patent).

8380. per dozen.
Strong machine-made, Polished.
A turn of the knob causes the Grappler to clutch the catch-plate and securely locks the sashes.
It lifts up and draws close together dropping sashes.

To be obtained through Hardware Merchants, Factors, or Wholesale Ironmongers, through whom our New and Revised Catalogue of General Brassfoundry may also be obtained.

In the Warrender district tenements have been in progress during the whole year, and plans have already been passed to almost wholly complete Spottiswoode Street. During the year the only vacant stance, opposite Warrender Baths, has been built up with large flatted tenement houses. Tenements have also been in operation during the whole year in Strathearn Road. A new company has feued a large piece of ground at the foot of Kilgraston corner of Grange Loan, and are building small self-contained houses, which seem to be readily taken up.

There has been nothing of outstanding importance in Morningside, the most notable building being the branch public library for the city. East and west of Comiston has been devoted to self-contained houses by the same builders as in former years, and no doubt in a short period this desirable locality, with its splendid outlook and proximity to the Braid Hills, will be built up with a very desirable class of house. A new start has also been made on the Old Braid Road, facing the Braid Hills, which should suit golfers who want to be early at the tee. In Merchiston, Gorgie and West-End districts there has been little or no outstanding feature. A few tenements have been erected in Harrison Road and Westfield. A new motor depot has also been erected in Westfield, and one or two rather extensive additions to the North British Rubber Company's premises, Gilmore Park, have been made.

From Merchiston to Murrayfield the industry in the building trade has never had the slightest abatement. Villas, self-contained houses and tenements have been consistently erected here during the whole year. On the Murrayfield Estate Feuing Company's ground alone there has not been the slightest sign of a slow market, and building has gone on during the past year as persistently as ever. New streets have been opened up and built on both sides, and this area, with its high altitude and accessibility both by car and rail, is likely to remain popular. Comely Bank and Inverleith have both formed animated centres of building prosperity. Perhaps it may be said that in no other district where houses have been built from a speculative point of view have they met with so much acceptance. The death of the late Lord Provost, Sir James Steel, who was practically the pioneer of the building industry in Comely Bank locality, may somewhat

retard much progress meantime, but that will not deter householders from hankering after houses in a desirable district, with convenient access to parks and country strolls.

The district under the supervision of Edinburgh and Chancelot has not developed beyond what was anticipated but numerous tenements have been erected, and these find both ready purchasers and tenants. In Broughton district quite a new small town is quickly growing. Toward Abbeyhill there has been a very noted advance, both in tenements and self-contained houses. For some years the locality has been lying practically dormant, but at the present time a considerable building industry is being carried on in Willowbrae Road and Avenue, and plans for what will ultimately be a small village have partially been approved on an area of ground to the east of Piershill barracks. Indeed, in a very short time it will be a surprise if the road from Piershill to Portobello is not flanked on both sides with houses of the villa type.

In Newington district some extension has taken place. The new streets laid out by the superior have now been well built on both sides, and as the stances here are all secured by private individuals previous to building, there is not the same feeling of speculation apparent by the exhibition of "To Let" and "For Sale" tickets. Quite a number of self-contained houses have been passed through the Dean of Guild Court for erection in Lady Road and new streets through Craigmillar golfing park, and, although they have stood for a considerable time in abeyance, it is not expected that these houses when built, with their fine southern exposures looking towards Craigmillar Castle and Liberton, will be long tenantless.

Perhaps one of the busiest localities in the city during the present year has been Portobello, where tenements, villas and self-contained houses have been constantly added. There have also been a few public buildings of some importance, viz.:—The new Post Office in Windsor Place, rapidly approaching completion; the new premises in High Street for the National Bank, the masonwork of which is well-nigh completed; and the new chapel in Brighton Place for the Roman Catholic denomination, the memorial-stone of which was recently laid by Archbishop Smith.

ARCHITECTURE, FURNISHING, DECORATION, FINE ARTS.

E. LYON-CLAESEN, Publisher, 8 Rue Berckmans, Brussels

The house makes a specialty of publishing artistic editions of all kinds—*éditions de luxe*—and can supply all the works treating the subjects of Architecture, the Industrial and Decorative Arts, Furniture, Painting, Sculpture, the Fine Arts, &c.

TOURS ET TOURELLES HISTORIQUES DE LA BELGIQUE, or THE HISTORIC TOWERS AND TURRETS OF BELGIUM From the water-colours of JEAN BAES. Among the architectural publications on the ancient edifices of Belgium, scarcely any can be found which give a reproduction of the admirable towers and charming turrets, so justly considered of the greatest interest. This work consists of 50 coloured folio plates, difficult to distinguish from the original mounted on handsome cardboard and contained in a rich portfolio. Price £4.

TRAVAUX D'ARCHITECTURE EXECUTÉS EN BELGIQUE, or ARCHITECTURAL WORKS EXECUTED IN BELGIUM. By HENRI BEYEART, Architect. This work contains the most interesting productions of Henry Beyeart, and presents, with fullest details, his principal edifices. It is the reproduction of his own designs arranged by himself. Each construction is explained by plans, details, elevations, sections, &c., drawn to scale. The work consists of 240 folio plates, in two portfolios. Price complete, £14 8s.

L'EMULATION.

A MONTHLY JOURNAL. ORGAN OF THE "SOCIÉTÉ CENTRALE D'ARCHITECTURE" OF BELGIUM. The latest volume of the New Series is in preparation, and will form a valuable addition to the Collection. Each number consists of four or five folio plates, eight pages of text, and a supplement of twelve pages. It produces in chromolithography, heliogravure, phototype, etching, &c., prominent examples of ancient and current architecture, and the text is devoted to this profession. The Supplement contains articles pertinent to architecture, and advertisements. Subscriptions date from January 1. Price per year, £1 8s. The whole year, when complete, in portfolio, £1 12s.

THE

Architect and Contract Reporter.**IMPORTANT NOTICE**

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

EDITORIAL NOTICES.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

COMPETITIONS OPEN.

ALNWICK.—Jan. 24.—The governors of Alnwick infirmary invite designs for a new building. First premium, £100; second premium, £30. Mr. Frank Caws, F.R.I.B.A., has been appointed assessor. Plans on application to Mr. W. T. Hindmarsh, 26 Bondgate Without, Alnwick, hon. sec. to the building committee.

AYLESBURY.—Feb. 28.—For public elementary school for 750 children. Premiums 50% and 25%. Conditions and plan of site obtainable from Mr. C. G. Watkins, Education Secretary, Aylesbury, on payment of 1*l.* 1*s.*

LAMBETH.—March 30.—For municipal buildings at Brixton Hill. Particulars from Mr. H. J. Smith, Town Hall, Kennington, S.E.

OXFORD.—Feb. 1.—The education committee of the county of Oxford invite competitive designs for a provided school for 800 children in three departments, together with a teacher's house, at Caversham. Mr. S. Stallard, county surveyor, Oxford.

PRESTON.—Feb. 28.—Designs and plans for new elementary school. Premiums of £50, £30 and £20. Plan and conditions from Director of Education, Education Offices, Preston.

WOLVERTON.—Feb. 28.—For public elementary school for 400 girls and 400 infants. Premiums 50% and 25%. Also for secondary school to accommodate about 120 boys and girls. No premiums offered. Conditions to be obtained on payment of 1*l.* 1*s.* in each case from Mr. C. G. Watkins, Education Office, Aylesbury.

CONTRACTS OPEN.

ABERYSTWYTH.—Feb. 4.—For completing the nave and building new tower, &c., to St. Michael's Church, Aberystwyth. Messrs. Nicholson & Hartree, architects, Hereford.

ARNSIDE.—Jan. 24.—For the erection of the north aisle, &c., to St. James's Church, Arnside, near Kendal. Mr. R. Morton Rigg, architect, Arnside.

WOKING.—Feb. 11.—For supply and erection of a retort-ouse constructed of steel stanchions, roof and girders, and overed with corrugated iron, for the Woking District Gas company. Messrs. W. A. Valon & Son, 140 Temple hambers, E.C.

WORKINGTON.—Jan. 23.—For the building of house and op and house in Napier Street, Workington. 45 Cumber-nd Street, Workington.

THE Bill which the London and North-Western Railway company intend to promote in Parliament contains a clause which would empower them to break open the streets of rewe to lay, or relay, or repair their gas mains. The own Council have decided to oppose the Bill. The own clerk was instructed to write to the railway company tating that such a clause ought not to have been even uggested after the decision of the House of Lords com- ittee on the company's previous Bill; that the Council as not prepared to grant any permanent rights in their reets to the railway company as a gas company; and that ey felt bound to intimate that all future breaking up of e streets for gas purposes must be done by Corporation ficials at the company's expense. It will also be pointed ut that while in two or at the most three instances the ompany had asked permission to break up the streets in umerous instances they had done so without permission, nd the Council decline to allow this to be continued.

THE Salop County Council have for several months been bringing pressure on the Ellesmere District Council to remove a nuisance caused by allowing the town sewage to flow into the river Perry. Several schemes of sewage disposal, ranging in cost from 11,000*l.* to 4,000*l.*, have been prepared by a Westminster engineer. At the last meeting of the District Council it was considered that these were too costly, and it was decided to ask a local engineer to prepare a new and cheaper scheme. The present borrowing powers of the Council amount to only 4,000*l.*

TRADE NOTES.

THE Stobhill general hospital for the Parish Council of Glasgow is being warmed and ventilated by means of eighty Shorland's double-fronted patent Manchester stoves with descending smoke flues.

A HANDSOME fountain has been erected at Hursley Park under the supervision of Messrs. A. Marshall, Mackenzie & Son, the architects. The handsome Venetian glass mosaic floor in various shades of blue was entrusted to Arrolithic, Ltd., of 18 Berners Street, London. The same firm have just carried out the floors in chancel of Sherfield English Church under Mr. Fred Bath, the architect, in their cloisonné mosaic.

ELECTRIC NOTES.

MR. J. E. WINSLOW, 30 Bishopsgate Street Within, has been appointed by the authorities of Coventry to superintend the construction of about 3 miles of new tramways and the reconstruction of $5\frac{1}{2}$ miles of existing tramways.

THE police committee of the Belfast Corporation estimate that the cost of lighting the principal streets (where poles are to be used in the centre of the carriageway) by electricity would be 2,093*l.* 15*s.* per annum as against 763*l.* for gas lighting. The City Council will not be recommended to carry out the lighting by the former method.

THE Metropolitan Borough Councils decided at a conference last week to inaugurate combined opposition to the large number of companies who are promoting Bills in the

next Session of Parliament to enable them to supply electricity in London in competition with the Borough Councils. There were representatives from twenty-one Borough Councils.

THE Yarmouth Town Council have accepted the recommendation of the borough electrical engineer to extend the undertaking at a cost of 10,000*l.* The principal items are the purchase of another 300 kw. engine and dynamo with boilers for 4,500*l.*, and the increase of the condensing plant at a cost of 2,500*l.* A new conduit to the harbour will also be required at an expenditure of 1,000*l.*

THE Nottingham ratepayers have, at a public meeting, accorded the necessary consent to the Corporation for the promotion of a Bill in the next session of Parliament for the extension of the present system of electric tramway traction in the city and the carrying out of works of street improvement at an estimated cost of about 100,000*l.* The new lines are designed to meet the wants of the eastern district of Nottingham. Six hundred thousand pounds have already been spent on the tramways in other parts of the town.

BUILDING AND BUILDERS.

THE education committee of West Bromwich strongly recommend the extension of the technical school and the establishment of a pupil teachers' centre without delay.

THE Doncaster Rural Council have approved plans and sections submitted by Messrs. D. Balfour & Sons, C.E., for the sewerage and disposal of the sewage of Askern, and application is to be made to the Local Government Board for sanction to a loan for carrying out the works for 3,430*l.*

THE Admiralty, it is believed, intend establishing three coastguard stations in the Isle of Man—one at Peel, on the west coast; one at Point Cranstal, near the north of the island; and one on Spanish Head, near the south of the island. The outlay will amount to several thousands of pounds.

THE Court of Common Council having been asked by the London County Council to give their views on the London Building Acts (Amendment) Bill, appointed a small com-

mittee for the purpose of taking all the necessary steps to oppose the Bill, and instruct the City Remembrancer from time to time on it.

MESSRS. JESSE HAYWARD & EDGAR W. WOOSTER, building contractors, Bath, announce that the partnership known under the title of Hayward & Wooster is by mutual consent dissolved. Mr. Hayward retires, and his son, Mr. Geo. Hayward, joins Mr. Wooster as junior partner, by whom the business will in future be continued under the old style of Hayward & Wooster.

Two new Council schools are proposed to be built at Old Trafford to provide for nearly 2,000 children. The Stretford education authority have secured sites—one on Stretford Road, near the Cornbrook Wesleyan school, where it is proposed to erect a building for 1,000 scholars, including 400 infants, and another in Ayres Road, Brooks's Bar, adjoining St. John's Church, where 800 scholars will be accommodated.

THE plans and buildings committees, in their report to the Handsworth District Council for the year 1904, state that 242 plans were submitted, of which 106 represented 317 houses. Other plans included new streets, public baths, a Baptist church and a Church institute, all of which were approved. The number of houses passed for occupation was 572. No prosecutions had been instituted during the year. In 1903 179 plans were approved, representing 778 new buildings, and the number of houses passed for occupation that year was 747.

THE Manchester City Council at a recent meeting appointed a special committee to inquire into the question of the establishment of a municipal works department, under which Corporation enterprises might be carried out directly by the Council, instead of under contract. The committee held their first meeting on the 13th inst., and balloted for the appointment of chairman and deputy chairman. The Lord Mayor was appointed chairman, and Councillor J. Royle (ex-Lord Mayor) deputy chairman. It is understood that the committee will, as soon as possible, obtain information necessary for them to report to the Council.

THE Scottish Amalgamated Society of House and Ship Painters state with regard to working agreements, in their monthly report, that several branches have again been able to

settle for another year without any alteration upon existing conditions. In the new Glasgow agreement, however, there is an extension of a half-mile on the suburban and county boundary, the concession removing what employers considered to be a long-standing grievance on their part. Dumfries branch have withdrawn their proposed alterations, and the Paisley employers have made several drastic changes and threaten to lock out the men if they decline to accept them.

A NEW school was opened recently at Bathgate, near Edinburgh. The building, which has been erected from plans by Mr. J. Graham Fairley, architect, Edinburgh, consists of two storeys, and its eight spacious, high-roofed and well-lit classrooms give accommodation for 480 children, provision having been made for teaching sixty pupils in each room. These classrooms, however, by no means represent the full space available within the building, a feature of which is its two large halls, one on each floor, measuring 60 feet by 26 feet each. These halls will be used for drill and as music classrooms. In laying out the plan the School Board have been careful to keep in view the possibility of having to provide further accommodation in the future, and it has been arranged that, without destroying the main features of the building, further accommodation can be provided for a total of between 1,000 and 1,200 scholars. The new school has been erected at an estimated cost of 9,500l.

THE Glasgow Trades Council at their last meeting considered the following letter sent by Mr. A. Cameron Corbett:—"I shall be glad if you put the following proposal before the secretaries of the different building trades in Glasgow. If they unite together and form a committee for building workmen's houses of 2, 3 or 4 rooms in any suburb of Glasgow, I am willing to give a guarantee to the Bank of Scotland enabling them to draw up to 2,000l. for this purpose. If this proposal seems likely to meet with their approval, I should be glad to have a talk over the matter with them. Of course I could not under any circumstances derive any profit out of the transaction, but if it succeeded I should have the satisfaction of having initiated a very interesting experiment in working-class management, and of having done something to mitigate the difficulty of finding employment." A meeting of the building trades secretaries is to be held to consider the proposal.

GILBERT WOOD & CO., Ltd.

16-11 Imperial Buildings,

Ludgate Circus, London, E.C.

At the Southwark County Court, on Tuesday, Judge Addison heard a case under the Workmen's Compensation Act in which the point at issue was this:—Is a firm obliged to go on paying compensation to an injured man if he refuses to undergo an operation that might, or might not, cure him? Counsel for the firm urged that it was clearly reasonable that the man should undergo the operation, and it would be only fair if some pressure were put upon him by the Court to consent. "If you can persuade him, you may do so," said Judge Addison, "but I never attempt to persuade people to do something that I have no power to compel them to do. I have not even the power to order an injured person who is claiming damages to undergo a medical examination. I have power to order an examination of anything save a human being." The application to discontinue the award was then dismissed with costs.

A FIRM of architects have designed a building to be erected at Baltimore in which no wood will be used. It will be six storeys, 41 feet by 70 feet, and the entire structure is to be of reinforced concrete and steel. Even the doors, trims and door jambs are to be of metal. The windows are also to be of metal, and will be glazed with wire glass. The side walls, columns and rear walls, as well as the supporting columns of the front walls, will be of concrete. The floors will all have a top dressing of cement $1\frac{1}{2}$ inch thick. The stairs will be of concrete, with slate treads and wrought-iron balustrades. The elevator shaft will be of concrete, as will also the enclosure around the stairway and elevator hall. The cellar and roof are to be of cement. One of the interesting features of the structure is that in an ordinary building of this height the walls are about 21 inches thick, but by the use of the reinforced concrete 6 inches will give sufficient strength. This will give 40 feet clear breadth on the inside of the building.

THE Aberdeen Town Council decided on Monday that, before any further steps be taken regarding the lighting of the streets with electric light, a deputation be sent to Edinburgh and Dalkeith to ascertain the conditions of agreement existing in these towns.

VARIETIES.

THE waterworks committee of the Bolton Town Council are considering the afforestation of the Corporation watershed as a means of providing work for the unemployed.

THE Barton education committee have approved of the proposal to extend the Cadishead Wesleyan day school to accommodate 200 more children. St. John's National Schools, Walkden, are also to be enlarged.

THE Scarborough advertising committee and the Scarborough Traders' Association are strongly advocating an increase of the amount spent upon advertising the town. The present allowance is 500*l.* a year.

HIS Grace the Duke of Richmond and Gordon has accepted the position of joint trustee of the Central Insurance Company, Ltd., in succession to the late Mr. Herbert Chamberlain, the other trustees being the Hon. Mr. Justice Grantham and Sir Peter Walker, Bart.

THE Surrey County Council have convened a conference of local authorities in Surrey and Hampshire which are interested in the question of fixing the responsibility for compensation for damage done to the roads by extraordinary military traffic.

THE Mayor of Scarborough (Mr. Morgan) has sold the iron of the wrecked North Pier at Scarborough for 500*l.* Last September Mr. Morgan bought the pier (which originally cost 25,000*l.*) for 3,500*l.* It was wrecked by the recent gale.

THE Royal Commission on Sewage Disposal will carry out a series of special experiments, extending from twelve to eighteen months, at the Dorking outfall works for the purpose of determining the relative value of the different methods of treating domestic sewage.

MR. JAMES WALKER (engineer to the Tyne Commissioners, Newcastle) has consented to inspect the Scarborough Marine Drive sea-wall, and advise as to safeguarding against future injury of a similar nature to that caused by the recent gale and tidal wave.

A SUM of 150,000*£l.* is set apart for the creation of a maritime terminus for the railway at Sheikh el Barghout, a place some thirty miles to the north of Suakin. The new port, the official name of which has not yet been decided on,

ESTABLISHED OVER 200 YEARS.

has the immense advantage over Suakin of possessing a commodious harbour, easily accessible to ships of heavy draught.

THE construction of a light railway from Falkland Road station to Falkland burgh has been under consideration at a meeting of Cupar district committee of Fife County Council. The cost of carrying out the scheme is estimated by the surveyor at 10,500*l.*—3,000*l.* per mile.

THE East United Free Church in Coldstream, Berwickshire, is to be sold by auction. The public are informed that "the building is in thorough repair, and the area was a few years ago entirely re-seated with pitch-pine and fitted with hot-water heating apparatus. Entry at Whitsunday, 1905, or sooner if so arranged. Feu-duty nominal."

THE Runcorn Urban District Council has resolved to apply to the Local Government Board for sanction to a loan of 6,000*l.*, to be repaid in sixty years, for the purpose of laying a 12-inch main from the Liverpool Vyrnwy main at Norton Tower to the Runcorn reservoir. The scheme will add 5*d.* in the £ to the general district rate.

THOMAS ROSE, one of the bell-ringers at Stoke-on-Trent, was killed on Saturday while examining the bells. It is supposed that the bell was hanging at an angle when deceased went to examine it, and that he disturbed it in some way, causing it to fall towards him and crush him against the girder.

THE Wigton Medical Officer of Health in his annual report comments upon the tenements in the poorer part of the town, and states that the lack of attention and cleanliness on the part of the occupants seems to be their worst feature, so that there is greater need for improvement in the persons than in their dwellings. If drunkenness and vice could be abolished, other insanitary conditions would cure themselves automatically.

THE *Bulletin Commercial* (Brussels) states that several projects are contemplated by the Municipality of Athens for the improvement of the streets. It is proposed to lay down three kinds of paving in different parts of the city—macadam tarred on the surface, asphalt and granite. About 300,000 square metres would be macadamised, 74,000 square metres asphalted and 60,000 square metres paved with

granite. The total cost of the work is estimated at about 140,000*l.* and the upkeep during the first ten years at about 2,400*l.* per annum.

THE general purposes committee of the Burnley Corporation has selected the following applications for the vacant town clerkship for further consideration:—Mr. Edward Cooper, solicitor, Blackburn; Mr. J. W. Halloway, deputy town clerk of Chatham; Mr. Leonard Hewlett, senior solicitor, town hall, Leeds; Mr. H. L. Parr, assistant solicitor of the West Riding County Council; Mr. P. Thomas, town clerk of Leigh; and Mr. Alfred Varley, town clerk of Colne. The salary is 700*l.* a year, rising to 900*l.*

A QUESTION has arisen as to the disposal of the sum of 300*l.* (shown in the Town Chamberlain's books) between the trustees of the Watt Library Memorial Buildings and representatives of the Glasgow Corporation. The claim on the part of the trustees, who on Wednesday held their first meeting for over fifty years, is that the money was the residue of public subscriptions for the erection of the buildings and the Chantry statue of Watt, and that it ought to be applied for the upkeep of these, as being in harmony with the original object of the donors. The counter-claim is that the sum should be handed over to the Carnegie fund.

THE Manchester city coroner held an inquest last week as to the death of a man who was found dead on a burning brick-kiln, where he had been sleeping. Mr. Lewis, Government inspector of factories, in giving evidence, said the watchmen at the brickfields had expressed to him their fears of violence. The problem of how to keep the tramps away from the brickfields was so difficult of solution that all he could suggest was that it should be made as difficult as possible for them to climb on the kilns, which furnished a cheap and comfortable night's "doss."

BROOKLYN Bridge, one of the engineering wonders of the world, and the main artery that connects New York with suburban Brooklyn, shows signs of decay (says the *Telegraph's* New York correspondent). No bridge has ever borne such a tremendous daily traffic of trains, trams and other vehicles, besides foot passengers. In order to prevent a tremendous disaster, the engineers have now recommended the adoption of plans entailing the virtual reconstruction of

the bridge. Two years must elapse before its completion, and the cost is roughly estimated at 1,000,000*l*.

THE Manchester Steam Users' Association will on February 14 celebrate the fiftieth anniversary of the foundation of the Society by Sir William Fairbairn, Mr. Henry Houldsworth and Sir Joseph Whitworth, under the presidency of the then Mayor of Manchester. The full title of the Institution is "The Manchester Steam Users' Association for the prevention of Steam Boiler Explosions and for the Attainment of Economy in the application of Steam." It is pointed out that in comparison with all other countries, even with those where there is compulsory boiler inspection by the State, England has now relatively the fewest boiler explosions.

KING LEOPOLD (says the Brussels correspondent of the *Standard*) has just taken possession of the new Japanese palace which has been building for him in the royal park at Laeken during the last four years. When visiting the Paris Exhibition of 1900, His Majesty greatly admired the "Tour Japonaise"—one of the architectural marvels of the French World's Fair—and conceived the idea of reproducing it. A French architect (M. Marcel) was charged with the work, which has cost about 5,000,000 francs. The palace is built in genuine Japanese style. It is divided into several wings.

THE watch committee of the Manchester City Council propose to take action with regard to the use of the congested thoroughfares in the city by steam locomotives used for heavy traction, and have called upon the police for a return of traffic using the congested areas. It is desired that a clause should be inserted in the next Manchester General Powers Bill which comes before Parliament to prohibit the use of specified streets and roads by locomotive traction-engines during specified hours when such streets and roads are congested by electric-traction cars, horse and vehicular traffic, which is quicker moving.

LOCAL opposition strenuously opposed the proposal to erect a theatre in the Soho Road, Handsworth. It was pointed out that providing the promoters complied with the building by-laws laid down by the District Council it was questionable if the local authority had any power to prevent the erection of the theatre. The architects have now

presented plans to the Handsworth District Council for the proposed building, which were considered recently. The committee, it is stated, will recommend the local authority at their meeting to disapprove of the plans owing, it is alleged, to the fact that the exit arrangements are not adequate.

THE Aberdeen Harbour Board have prepared their annual accounts. The increase of 4,394 tons of cement is chiefly accounted for by the Commissioners' own requirements at the harbour. Foreign granite still continues to increase, and the quantity imported was 24,199 tons, or 5,379 tons more than in the preceding year. Ten years ago the quantity imported was 8,224 tons. A serious falling-off occurred in the chief article of export, viz. stones. Causeway stones were down 11,422 tons; pavement and building stones, 1,993 tons; rubble and chip stones, 2,530 tons; and granite waste slabs, 1,680 tons; while polished granite was up 841 tons.

THE Eastbourne Corporation new swimming and slipper baths in Motcombe Lane, Old Town, have been opened. The style of the building is Late Domestic Renaissance. The red walls are faced with Portland stone, and half-timbering is introduced. There are twelve slipper baths for men and three for women, and a shower bath. The swimming bath is 60 feet long and 24 feet broad, with thirty-six dressing boxes, a diving stage at the deep end, and an umbrella spray at the shallow end for removing bubbles and scum and freshening the water. For the convenience of those leaving the bath a footbath with shower over has been provided. Fresh water is used and the heating apparatus will be capable of keeping the water at uniform temperature without necessarily renewing the supply. The building was designed by the borough surveyor Mr. W. Chapman Field. The cost was 5,000*l*.

ALTHOUGH the asphalt lakes of Trinidad and Venezuela furnish over 90 per cent. of the asphalt used, small deposits are found elsewhere. The largest South American asphalt lake consists of a dark brownish deposit of a semi-fluid and semi-solid substance surrounded by banks from 3 to 6 feet high. In the centre of this lake is a continual ejection of hot fluid asphalt, accompanied by large bubbles of gas. It is excavated in pieces weighing about twenty-

five pounds, sections 40 feet in area and about 4 feet deep being worked at one time. It is placed in large tubs, resting upon small flat-topped tramcars operated upon a narrow-gauge road. The entire surface is constantly moving, thus necessitating a continual relaying of the tracks. The freshly-excavated asphalt is conveyed to the shore, where the tubs are lifted by hydraulic power to an aerial tramway, by which it is conveyed to the large wharf situated on the Guanoco river, about five miles distant from the lake. Upon its arrival at a factory it is heated until the water is expelled and the earthy material cast to the bottom of the large vats, and it is poured through a sieve into barrels, where it solidifies.

NEW CATALOGUES.

THE latest catalogue of the British Uralite Company, Ltd., contains a remarkable variety of buildings in which their sheets or slabs have been used. The series relating to the Naval College buildings at Osborne, in the Isle of Wight, comprises the interior of the master's quarters, the cadets' dormitories (interior and exterior), the officers' quarters, gymnasium, master's quarters, chemical laboratory, &c. The views show that it is equally adapted for interior and exterior work, and no sign of patchiness is anywhere to be discerned in the photographs. The style of the buildings of the college is that of the cottage type. But in such a structure as the Pavilion at Great Yarmouth the style departs from precedents. Mr. J. W. Cockrill, the architect, says:—"I have now used some 2,000 sheets of Uralite in erecting a pavilion to seat 1,000 persons, with standing room for 800 more, on the Corporation Pier. The material has lent itself to the rapid construction which was necessary, the whole building being completed within two months after the steel structure was ready, and the decoration of the interior, which is panelled with Jarrah strips, was an easy and rapid matter, as the Uralite permitted the work being distempered and decorated at once." Among other buildings which are illustrated are a garage at Herne Bay, an Irish cottage, office buildings for the County Council of Yorkshire, lodges, a school church, buildings for tea planta-

tions, bungalows, pavilions, hospitals, billiard-rooms, &c. In the large "Electra House" the material has been also employed, and Messrs. Colls & Son, the builders, say: "For covering partitions and ceilings, in lieu of plaster, the advantage of quick application and the absence of wet and dirt, as with plastering, make Uralite most valuable, apart from its fire-resisting properties, which, of course, form the most important argument for its use, as it satisfies the requirements of insurance and other surveyors." With such manifold tests it would be a waste of time and labour to say more about the applicability of the material in cases where rapidity of erection and lightness of weight are required as well as immunity from fire.

It is well known that the manufactures of Messrs. Hartley & Sugden, Ltd., of Halifax, are only obtainable through the trade, but as all their boilers bear the familiar trade mark in a prominent position there is little risk of deception. The firm also guarantee for two years the materials, workmanship and working under ordinary conditions of all their boilers. The catalogue of 120 pages gives representations and details of the numerous types of steam and hot-water boilers which are produced by the company. The particulars are sufficiently ample to enable the reader to decide what class is best adapted to his requirements. There is no attempt at persuasion; the forms, dimensions, prices and heating power are left to be their own advocates. It is unquestionably a great advantage for architects, engineers and contractors to be able to deal with makers who can supply whatever is required for heating from their own establishment, which in this case, it may be added, has been lately enlarged and supplied with the latest plant. Among the varieties we desire to point out those for low-pressure steam and hot-water heating. The "Savile" is especially adapted for the supply of hot water and may be used for that purpose as well as heating in clubs, hotels and country houses. This boiler can also be obtained with an asbestos jacket and decorated case which will conserve the heat and make it presentable in passages or halls when required. Messrs. Hartley & Sugden, Ltd., were awarded the gold medal at the Paris International Exhibition.

BUILDING EXHIBITION, 1905.

THE Building Trades Exhibition will open on April 27 this year and close on May 6. Notwithstanding the general depression in the building trades, this biennial fixture will outrun all its predecessors in numbers and in the variety of exhibits.

Almost all the 1903 exhibitors will be represented, and they will be reinforced by some sixty leading firms who have never before exhibited.

Several novelties are promised, particularly in fire-prevention partitions and floors. Over 256 exhibitors have already taken space, and every inch of the spacious ground floor has been appropriated.

The Right Hon. Lord Windsor (First Commissioner of H.M. Works) has kindly consented to perform the opening ceremony, and he will be supported by leading men interested in the building industries.

AN IRISH CONTRACT CASE.

On Saturday counsel applied in the King's Bench Division, Dublin, on behalf of the defendants to have the case of Hill v. the County Council of Galway and the County Council of Roscommon set down for hearing before a judge without a jury, but with the assistance of an architect as assessor. It was explained that last sittings it was moved to have the matter in dispute referred to arbitration, as it was a very complicated building contract case. The action arose out of certain building alterations in the lunatic asylum of Ballinasloe amounting to nearly 60,000*l.*, and was for the balance alleged to be due on foot of the contract amounting to 4,905*l.* In the course of the argument it was suggested by the Court that probably the case was of such a character that an arbitration would not be the best form of trial, and, on the other hand, that a jury would probably not be the best form of trial. Mr. Justice Gibson suggested that probably the best form of trial would be by a judge without a jury, and with the assistance of an experienced architect as assessor, and they all agreed that probably that would be the most satisfactory form of trial, having regard to the nature of the case. But counsel had at that time no authority on the part of his clients, the County Councils of

Galway and Roscommon, to come to any definite undertaking of the kind. Since then, however, it had been agreed on both sides that that form of trial would be the best under the circumstances, namely, a trial before a judge without a jury, but with an architect to be selected by the parties as assessor, the remuneration of the assessor to be the costs in the cause. No architect had yet been selected, but an effort would probably be made to secure the services of Sir Thomas Drew.

The Court made an order directing the case to be set down for trial in the manner proposed.

OVERHEAD TRAMWAYS.

A PAPER on "Tramway Overhead Equipment Materials" was read before the Tramways and Light Railways Association by Mr. H. M. Sayers. He pointed out that the necessity of studying appearance should not be a serious addition to the primary engineering necessities, for the appropriate use of materials and obvious adoptions of means to ends satisfied the æsthetic as well as the practical sense, and where incongruity with architectural and natural beauties was the danger unobtrusiveness would probably give better results than any elaborated attempts at ornament. The first mechanical condition to be satisfied was evidently that of safe and stable support. After discussing at length the technical questions of design and erection of the line, the choice of materials and design of parts, he said that the cost of overhead work seemed to vary a good deal more than it should. Some authorities put it at 1,500*l.* to 2,000*l.* per mile of route, but he did not know how so much could be properly spent. Thoroughly good span-wire work for either double or single lines could be erected for 1,200*l.* per route mile with fair profit to the contractor. Bracket armwork for single lines, where a single line of poles was generally sufficient, could be done for 1,000*l.* per route mile, or even less under specially favourable conditions. These rates included average amounts of guard wiring and proportion of junctions, but very heavy and complex junctions, car shed, fanwork and similar special requirements would involve some additional expenses. A great deal of money could be spent on elaborate scrollwork and fancy painting,

especially if a little gold leaf was thought necessary to harmonise with the surroundings, but these were matters of taste rather than engineering. In some towns there certainly was the excuse that the overhead structure was the only thing visible in the streets that bore the slightest trace of design or grace, of which the most should therefore be made. A discussion followed.

CORE MAKING.

At a meeting of the Metallurgical Society on Saturday, at the Birmingham Municipal Technical school, a paper on "The Principles and Practice of Core Making" was read by Mr. Robert Buchanan, the president of the British Foundrymen's Association.

Attention was called to the two prime necessities of core sand, viz. infusibility of the components and penetrability by gases formed by the molten metal. It was also pointed out that just as in the human body the bones knit the whole together, so in cores the deficient cohesion of sand was reinforced by rods and irons for the purpose of binding together and keeping in shape the masses of sand. The particular advantage and disadvantage of green sand, dry sand and loam cores were pointed out, and the method of manufacture of each was illustrated practically. A core-making machine, kindly lent by Messrs. G. M. Riches & Co., Beccles, Suffolk, was shown at work making small sand cores, which were quickly made and accurate in shape. A number of lantern slides were shown illustrating British and American methods of core making. One of these views depicted a core weighing 30 tons, made by Messrs. Bellis & Morcom, Birmingham, and used to make a large casting for the Birmingham Corporation. Another notable illustration was that of the patent core-forming machine, invented and patented by Mr. Walter Jones, Titan Works, Stourbridge, and manufactured at the works there. This machine is operated by power, and makes cores from 2 inches up to 21 inches diameter, and to any length from 9 inches to 10 feet. A core 12 inches in diameter and 10 feet long can be made by it in three minutes. A number of these machines are at work in various parts of the country, and prove formidable competitors to the ordinary methods of core making, especially loam cores.

A practical demonstration of how to make bent pipes in loam with a minimum of pattern-making and expense concluded the lecture. A discussion followed.

SCOTTISH PORTLAND CEMENT.

ARRANGEMENTS have been completed for the manufacture of Portland cement in Scotland. A company has been formed in Dundee with Mr. J. L. Spoor as technical director for the purpose, slow setting cement being preferred.

The extensive quarries are situated on the ridge and adjoining Cousland village, and at the foot of the hill the cement works have been erected. A tramway connects the quarry with the works, and a siding from the Ormiston branch of the North British Railway gives ready access to the railway system. The limestone is run down from the quarries to the crushing plant, where it is reduced to the size of road metal, thence, by gravity, falling into further pulverising machinery, which reduces it to fine powder. This powder is conveyed automatically into storage bins. The shale undergoes a similar process, and is also binned. From these separate stores the raw materials are carried by conveyers and elevators to an automatic weighing machine, which is so set as to weigh at one operation the exact quantities of each material required for the proper mixture. This object having been obtained, the mixture finds its way into the huge cylindrical tube mill, where it is thoroughly incorporated and ground to the finest powder, thence passing on to the brick presses to be made into bricks. Up to the delivery of the bricks from the presses, the whole process is automatic and free from the variations usually found in cement works built on haphazard rule of thumb lines. A constant scientific check on the mixture is kept by analysis throughout the day, with the object of securing regularity of quality and uniformity of product.

The bricks are then placed in the hoists and taken up to the top of the kilns, in which they are burned to clinker.

This clinker, after passing through Blake crushers, is reduced in ball mills and finished to fine powder in tube mills, passing by automatic conveyers to the warehouse floors as the finished Portland cement for the market.

It will be seen that the plant is what is termed a "dry process" plant, and designed to eliminate rule of thumb

risks by automatically controlling the manufacture on scientific lines.

The most modern plant by the best makers has been installed. The engine (compound condensing, with rope driving), of over 400 horse-power, is by Shanks, of Arbroath. The boilers are Scottish, while the Continent has been laid under contribution for the ball mills and tube mills. Leeds has furnished the brick presses, Leicester the crushers, while locally everything has been ordered that could be suitably obtained. The kilns are the well-known Schneider kilns. The whole plant has been erected under expert supervision and by local workmen, who now, under the experienced cement works manager, Mr. Greaves, manufacture the cement. The company has built cottages for the workpeople in the village of Cousland.

The warehouse is alongside the railway siding, and trucks are loaded under cover.

The testing laboratory is fitted with the requisite chemical and mechanical appliances for thoroughly testing the cement and controlling its manufacture.

The manufacture has been carried on all last summer, and the cement has been put to the proof of actual use in all classes of work by builders and contractors, and has given great satisfaction.

The best authorities have also made independent tests with satisfactory results. Mr. G. H. Gemmell, F.I.C., of Edinburgh, certifies it to be a Portland cement in which the ingredients are in correctly balanced proportions, free from adulterant of any kind, and closely corresponding to cement made from Thames chalk and estuary clay, or London Portland cement.

Professor Stanfield, of the Heriot-Watt College, certifies the cement as tested by him as of first-class quality, bore 440 lbs. at seven days and 622 at twenty-eight days, while a cube of concrete made of two parts cement and three parts granite chips gave a compressive test of 4,218 lbs. per square inch.

Tests made at Leith town hall recently gave at seven days, 516; fourteen days, 546; twenty-eight days, 666 lbs. per square inch. Tests made by Mr. Blount, F.I.C., of Westminster, S.W., gave:—Seven days, 623; twenty-eight days, 743; while in all cases the fineness of grinding is excellent.

THE NEW REGENT BRIDGE, ABERDEEN.

A new structure has taken the place of the old viaduct which for seventy-two years spanned the dock in the line of Marischal Street. It has been in course of construction for the past five or six years and has cost about 60,000/. The new passage, says the *Scotsman*, was kept to the south of the old one sufficiently far to allow of its construction without interfering in any way with the old bridge and shipping traffic, and also to bring it more in line with the south entrance at the dock gates, as well as to afford a more central access to Upper Dock itself. The new passage is 67 feet wide and is formed of granite masonry quay walls, the south wall or abutment being 190 feet long, while the north measures 95 feet. On the south abutment the new swing bridge rests with the machinery below, and the pump house and dock offices occupy the west corner. The north abutment forms the rest for the end of the bridge when swung over the passages for street and railway traffic, and also carries the curves of the connecting railway lines. The whole of the walls are built of solid granite masonry laid on a foundation of concrete and granite piers, sunk through the soft bottom of the dock until hard strata was reached, so that when future deepening of the dock takes place the walls may not fall in or subside. The foundation piers were each 14 feet wide, 12 feet long and 21 feet high, built up of large concrete blocks faced with granite, each weighing over five tons.

After the piers had been sunk to the required levels, and had withstood the severe test applied, the stonework of the walls was begun on the top of the piers, and raised as a solid mass, with a thickness of 12 feet and a height of 24 feet. The masonry is built of the largest and roughest kind of rubble stones, in cement mortar, to withstand the strains and rough usage from ships, the individual stones weighing from 3 to 5 tons each, and is aptly termed "cyclopean masonry." The walls are faced with dressed ashlar, surmounted by a heavy granite cope, all of grey Kemnay granite. These walls reach a total height of 47½ feet. Pivoting on the south abutment is the swing bridge itself, a steel structure of imposing dimensions. It has a total length of 156 feet and a total width of 45 feet,

or 5 feet wider than Marischal Street, and weighs nearly 700 tons when swinging. This enormous weight is carried on a large steel pivot, resting on a hydraulic press, so that the great mass swings round on a water cushion, which is practically frictionless. The large girders of the bridge are what is known as the "bowstring" type, being curved on the top, and measure 20 feet deep over the pivot, which is at the deepest part. The roadway carries two lines of railway for up and down traffic, two tracks for vehicular traffic wide enough to admit traction engines, and the sidewalks for foot passengers are placed outside the main girders on brackets, and are fenced off by steel latticework parapets. The bridge is built of the finest mild steel, and has been designed to carry the heaviest locomotives and trains on both lines of rails at one time, along with any vehicles, and as many people as can find standing space, or a dense crowd of people and vehicles all over the bridge. This has been necessary on account of the great weights to which locomotives are progressing, so that the steelwork may not be unduly strained in a few years. The deck of the bridge is neatly finished with timber causeway sets, to reduce the weight to be lifted and swung by the machinery.

Another and even more imposing feature is the powerful hydraulic machinery for lifting and swinging the structure, which lies concealed below the bridge itself in a huge pit far below the level of the water in the dock, but to which access is readily got by stone steps and passages in the masonry. The turning or slewing of the bridge is accomplished by two powerful hydraulic engines, which may be seen on the right and left sides of the bridge. The great feature of these powerful engines is their extreme simplicity, as no wheels, chains or gear of any kind is to be found about them; but they simply lay hold of the underside of the bridge, each with a massive steel arm or connecting rod, and revolve it in exactly the same way as the human arm opens or shuts a door. Should one of these engines break down, the other alone is able to revolve the bridge, and an arrangement of design enables each to work at half-power only when in combination. The pump-house is situated in the block of buildings on the south abutment, and there the water pressure is generated for operating the bridge by pumps working to 1,000 lbs. per square inch. The pressure water is stored in a large accumulator or

reservoir situated in the high tower at the north-west corner of the building, and sufficient water can be stored to enable the bridge to be swung and returned to its place without the aid of the pumps. The hydraulic pumps are in duplicate, one being driven by an electric motor, the other by a gas engine, as a safeguard against a complete failure of either source of power.

The approaches to the bridge are laid out with steel lattice parapets and fine-dressed Kemnay pilasters. Each of the end pilasters is of large proportions, and bears the inscription, "Regent Bridge, 1904," cut on the centre panel. To accommodate the public and ensure their safety in the midst of the volume of railway and vehicular traffic, large pavements and centre refuges laid with adamant slabs are provided, well lighted by electricity and protected by pillars. Each approach is guarded by a pair of large steel latticework swing gates, which effectually bar the roadway when the bridge is open for shipping. They are worked by electricity, the motors being placed below a small raised cabin, in which are situated the electric levers for opening and shutting them. On the north approach, in addition to the main swing gates, there are two smaller gates, forming the ends of the parapets next the passage, which are also open and shut with the main gates to allow the dockmen a clear passage alongside the entrance when handling ropes and fenders, and also to avoid collision with and damage from ships. Two handsome boat stairs are formed on the north approach, and both approaches are laid all over with granite causeway sets.

The engineers for the works have been Mr. Henry H. Wake, M.Inst.C.E., the consulting engineer; Mr. R. Gordon Nicol, M.Inst.C.E., the engineer-in-chief; Mr. William Simpson, Assoc.M.Inst.C.E., the executive engineer; and Messrs. Barr, Blackadder and Diack, assistant engineers. Sir William Arrol & Co., Ltd., Glasgow, have built the steelwork of the bridge; Messrs. Glenfield & Kennedy, Ltd., Kilmarnock, made the hydraulic machinery; and the railway work has been executed by Messrs. Hadfield's Steel Foundry Company, Ltd., Sheffield. The Regent Bridge improvement scheme, of which the new bridge is the most important feature, includes also the widening (still in progress) of the quays, and the total cost of the completed scheme is put at about 120,000l.

JENNINGS' PATENT "TIP-UP" AND LIFT-OUT LAVATORIES

FOR

Hospitals, Infirmarys, Schools, Hotels, Clubs, Railway Stations,
Offices, and every description of Building, Public and Private.

HIGHEST AWARDS AT EVERY EXHIBITION.

The simplicity, freedom from complication, and efficiency has caused this system to be universally adopted, while its cleanliness and saving of time, effected by the instantaneous discharge, is greatly appreciated. The deposit left round the plug hole basins is not only objectionable, but is considered by medical men to be too often the means of communicating disease.

This system has been adopted in Buckingham Palace, Windsor Castle, Marlborough House, and in the Residences of Royalty, the Nobility and Gentry, the principal Clubs, Hotels, Schools, &c., throughout the world, and as a guarantee of efficiency bears the name and address of the Patentee.

GEORGE JENNINGS, LIMITED,
BY SPECIAL APPOINTMENT SANITARY ENGINEERS TO H.M. THE KING,
LAMBETH PALACE ROAD, LONDON.

Telegrams, "JENNINGS, LONDON."

THE

Architect and Contract Reporter.**EDITORIAL NOTICES.**

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

IMPORTANT NOTICE

TO THE

**ARCHITECTS & CIVIL ENGINEERS
OF WESTMINSTER.**

As Westminster has become one of the most important centres of the professions of Architecture and Civil Engineering, arrangements have been made by Messrs. GILBERT WOOD & CO., Limited, to establish Branch Offices in that district at

43 OLD QUEEN STREET, S.W.,

Messrs. W. HAY FIELDING & CO. becoming the representatives for all business purposes.

Advertisements for Tenders, Building Land, Situations Vacant or Wanted, &c., can be left at those Offices, and copies of "The Architect," "Builders' Reporter," and other publications of Messrs. GILBERT WOOD & CO. can be obtained as early as at the City Office, Imperial Buildings, Ludgate Circus, E.C.

COMPETITIONS OPEN.

AYLESBURY.—Feb. 28.—For public elementary school for 750 children. Premiums 50*l.* and 25*l.* Conditions and plan of site obtainable from Mr. C. G. Watkins, Education Secretary, Aylesbury, on payment of 1*l.* 1*s.*

WIRE SAWING.

ACCORDING to a paper by Mr. E. Bourdon in the *Bulletin* of the Society for the Encouragement of National Industry, stone sawing by wire is done successfully in France. A complete plant comprises an endless wire passing round a series of pulleys, one of which is a driving pulley. The necessary tension is obtained by a straining trolley working on an incline plane, and between the driving shaft and this trolley is situated the saw frame, which carries the guide-pulleys for the wire saw. This wire, which is driven at a given speed, is caused to press lightly on the stone, and the cutting is done by sand mixed with water, which is conveyed into the saw-cut as the work proceeds. Though the mode of operation appears simple, it entails various difficulties in practical application. Three twisted steel wires are used, each wire having a diameter of 0.098 inch. The strands must be twisted fairly tight, and should make one turn in 1.18 inch. The wire may be driven in the workshop at a speed of 23 feet per second, but in quarries or adits the speed should not exceed 13 feet per second. The force exerted by the wire to produce the cut must be uniform, and must be capable of being readily varied. Moreover, it must be proportionate to the length of the cut.

An agreement has been come to between the Lytham Urban District Council and Messrs. Foote & Milne, electrical engineers, whereby the latter will produce, store and supply electricity for all public and private purposes within the urban district of Lytham. The Lytham electric-lighting order was allowed to lapse last year, but favourable terms have now been secured from the private company referred to, with powers of purchase at the end of ten or twenty years.

TRADE NOTES.

We have been requested to announce that Mr. Albert Meek, wood and metal letter manufacturer, late of 44 Blackfriars Road, is carrying on his business at 2 Meymott Street, Blackfriars Road, London, S.E.

MESSRS. PATMAN & FOTHERINGHAM, LTD. (James F. Parker, managing director), builders and contractors, of 100 and 102 Theobald's Road, London, W.C., and Park Street, Islington, N., &c., have just secured a large contract for the Gunnery College additions and alterations on Whale Island, Portsmouth, for the Admiralty. These works have to be carried out in a very short time. This firm recently completed the London Coliseum.

A LARGE clock with two illuminated dials, striking the hours and chiming the quarters, is to be erected on the tower of the public library, Penarth. The order has been given to Messrs. John Smith & Sons, Midland Clock Works, Derby.

MESSRS. SPOTTISWOODE & Co., Ltd., are now showing at their West End office, 123 Oxford Street, upwards of 100 drawings and paintings suitable for reproduction as show-cards, catalogues and posters of various kinds. Among the artists who have contributed are Lewis Baumer, Hal Hurst, R. Pannett, Popini, F. Haviland, A. K. Macdonald, Chas. Pears, W. E. Webster, W. H. Caffyn, W. A. Breakspeare, S. E. Scott, Prescott-Davies, P. W. Gibbs and Denholm Davis. We have already noticed some of the successful efforts of the firm in colour printing for business purposes. Admission is free on presentation of trade card.

An order for a powerful motor steam fire-engine for the London Fire Brigade has just been placed by the London County Council, the machine selected being Merryweathers' patent "Fire King" pattern, with all the latest improvements. It will have quick steaming water-tube boiler and the firm's new patent oil-fuel arrangements, enabling a turn-out to be made in one minute. The vertical double-cylinder engine will drive the road wheels and the two double-acting pumps. The pumping capacity will be 500 gallons per minute, and the new machine will thus be the most powerful land steamer in the London Brigade. The speed will be 20 to 30 miles per hour and the engine will be able to climb a 1 in 6 gradient.

ELECTRIC NOTES.

THE British Electric Plant Company, Ltd., Alloa, have obtained from the Perth Corporation an order for a 500 kilowatt (say 750 horse-power) steam dynamo for the Perth Corporation tramways and electric-lighting system. This set has an overload capacity of 600 kilowatts (say 900 horse-power).

THE Lichfield Corporation have given their consent to a provisional order to supply electricity within the city being

granted by the Board of Trade to Foote & Milne, Limited, Westminster, subject to the terms specified in an agreement to which the common seal was affixed. By the terms of the agreement the Corporation have consented to the revocation of their own order of 1901, and Foote & Milne will within two years from the date of the new order repay the 175*l.* expended in procuring the original order. The site of the generating station is to be within the city and the Corporation are to approve of it and to be entitled to periodical inspection of the works, cables, lines, &c. The maximum price which may be charged is fixed at 7*d.* per Board of Trade unit.

THE contract between the Belfast Corporation and Messrs. J. G. White & Co., of London, for the electrification of the city tramways has been completed, and signed by the Lord Mayor and the town clerk and sealed with the corporate seal. Messrs. White & Co. have undertaken the whole of the relaying, electrification and equipment, with the exception of the extension of the power-house, for the sum of 543,404*l.* 4*s.* 9*d.*, and they are under heavy weekly penalties for any excess of the stipulated period of nine months for the completion of the work.

THE Arbroath Town Council, after much delay, have arrived at a settlement with the Empire Electric Light and Power Company, London. In the meantime the Board of Trade have been threatening the Town Council that if steps were not taken forthwith to have the provisional order obtained by the Council some years ago put in operation, the order would be cancelled. The Council during their communications with the company repeatedly asked the Board of Trade to delay the lapsing of the provisional order, and this was done. The Board of Trade have now, however, intimated the revocation of the order.
